The writer's first necessity was of course to procure a house, and, after having searched for a month without success, she at length succeeded in finding one to her mind, which she thus describes:—'On the ground-floor is a court, open to the sky, round which the apartments extend, gallery above gallery. Round the court are five rooms; one large room (a mandarah), intended for the reception of male guests, with a fountain in the centre; a winter room; a small sleeping-room for any male guest; a kitchen and a coffee-room for servants. On the right hand, immediately on entering the street-door, is the door of the harem, or the entrance to the stairs leading to the ladies' apartments; the whole of the house, excepting the apartments of the ground-floor, being considered as the "harem." On the first floor is a marble-paved chamber, with a roof open towards the north, and sloping upwards, conveying into the chamber generally a delightful breeze. There are also five other rooms on the first floor; and in each of the two principal apartments, the greater portion of the floor, forming about three-fourths, is raised from five to six inches, the depressed portion being paved with marble. The reason for thus laying the floors is, that the outer slippers are left on the depressed portion, and the raised part, which is matted, is not to be defiled with anything which is unclean. The feet are covered, in addition to the stockings, with a kind of inner slippers, the soles of which, as well as the upper leathers, are of yellow morocco; they are called *mezz*; and the outer slippers, which are without heels, are styled *báboog*. The latter, by the way, I am often losing, and I fear I shall continue to do so, for I despair of learning to shuffle like the ladies of the country. When wearing the riding or walking dress, the *mezz* are exchanged for a pair of high morocco socks, and the *báboog* are worn as usual. They are

always pale yellow. The walls throughout are white-washed, and the ceilings composed of fancifully-carved woodwork, in some instances extremely tastefully arranged. Besides the rooms I have mentioned, there are three small marble-paved apartments, forming, *en suite*, an antechamber, a reclining chamber, and a bath. We little thought, when we congratulated ourselves on this luxury, that it would become the most abominable part of the house. Above are four rooms, the principal one opening to a delightful terrace, which is considerably above most of the surrounding houses; and on this we enjoy our breakfast and supper under the clearest sky in the world; but we always remember that the sweet air which comforts us in the mornings and evenings of our sultry days blows from the direction of our own dear country; and the thought renders it the more welcome.' This description applies to all the better sort of houses in Cairo. The rent paid for this mansion was only L.12 per year. Indeed, on turning to Mr Lane's minute work on the Modern Egyptians, we perceive, from an account of household expenses in the appendix, that living is remarkably cheap in Egypt. It appears that a man may live like a gentleman for some L.26 (2600 piastres) per annum, exclusive of house rent and servants.

After Mrs Poole had resided in the city some time, she made several acquaintances amongst the Cairene ladies, and in her visits to them obtained a more minute insight into the economy and manners of an eastern harem than has, to our knowledge, been ever yet furnished. One of her visits to the household of a person of rank we quote in an abridged form:—'When we arrived at the house of Habeeb Efendee, and had passed the outer entrance, I found that the harem apartments, as in other houses of the great in this country, are not confined to the first and upper floors, but form a separate and complete house, distinct from that of the men. Having passed a spacious hall, paved with marble, we were met at the door of the first apartment by the elder daughter of Habeeb Efendee, who gave me the usual eastern salutation, touching her lips and forehead with her right hand, and then insisted on removing my riding-dress herself, although surrounded by slaves. This was a mark of extraordinary condescension, as you will presently see. In the houses of the middle classes, the ladies generally honour their visitors by disrobing them of their riding-dress; but in the high harems this office is generally performed by slaves; and only by a member of the family when a guest is especially distinguished. When the lady I have mentioned had removed my surtout apparel, a slave in attendance received them in an exquisite pink kerchief of cashmere, richly embroidered with gold. The kerchiefs of this kind, in the harems of the wealthy, are generally very elegant, but that was the most perfect specimen I have seen of correct and tasteful embroidery. The riding-dress was immediately taken into another room, according to a common custom, which is observed for the purpose of creating a short delay, giving an opportunity to offer some additional refreshment when the guest has proposed to take her leave. My new acquaintance then conducted me to the divan, and placed me next to the seat of honour, which was reserved for her mother, the first cousin of the late Sultan Mahmoud, who soon entered the room, and gave me a cordial welcome, assigning to me the most distinguished seat on her right hand, the same to which her daughter had conducted me, while the grandmother of Abbas Pasha sat on her left. She was soon followed by her second daughter, who greeted me with much politeness, and in a very elegant manner assured me that I was welcome. A number of white slaves formed a large semicircle before us, and received from others, who waited in the antechamber, silver trays, containing glass dishes of sweetmeats. There were three spoons in each dish, and two pieces of sweetmeat in each spoon. These were immediately succeeded by coffee, which was also brought on silver trays; the small china cups being, as usual, in

stands shaped like egg-cups; but these were not, as in ordinary houses, simply of silver fligree, or plain, but decorated with diamonds. They were certainly elegant, but more costly than beautiful. The coffee is never handed on the tray, but gracefully presented by the attendant, holding the little stand between the thumb and finger of the right hand. After these refreshments a short time elapsed, when two slaves brought in sherbet on silver waiters, in exceedingly elegant cut-glass cups, with saucers and covers. Each tray was covered with a round pink richly-embroidered cover, which the slave removed as she approached us. To receive our cups, of the contents of which, according to custom, we drank about two-thirds, another slave approached, with a large white embroidered kerchief, ostensibly for the purpose of wiping the mouth; but any lady would be thought quite a novice who did more than touch it with her lips. In the course of conversation I expressed my admiration of the Turkish language; and, to my surprise, the elder of the young ladies gave me a general invitation, and proposed to become my instructress. I thanked her for her very polite offer, but made no promise that I would become her pupil; foreseeing that it would lead to a very considerable waste of time. In all the harems I have visited, Arabic is understood and spoken; so I do not expect any advantage from a knowledge of Turkish, unless I could devote to its study considerable attention.

'The perfect good humour and cheerfulness which pervaded this family circle is well worthy of remark, and much engaged my thoughts during the morning of my visit. All that I observed of the manners of the eastern women at Habeeb Efendee's and elsewhere, leads me to consider the perfect contrast which the customs of eastern life present to the whole construction of European society.

'Before our departure, it was proposed that I should see their house; and the elder daughter threw her arm round my neck, and thus led me through a magnificent room which was surrounded by divans; the elevated portion of the floor was covered with India matting; and in the middle of the depressed portion was the most tasteful fountain I have seen in Egypt, exquisitely inlaid with black, red, and white marble. The ceiling was a beautiful specimen of highly-wrought arabesque work, and the walls, as usual, whitewashed, and perfectly plain, with the exception of the lower portions, which, to the height of about six feet, were cased with Dutch tiles. I was conducted up stairs in the same manner, and I could not help feeling exceedingly amused at my situation; and considering that these ladies are of the royal family of Turkey, you will see that I was most remarkably honoured. When we approached the bath, we entered the reclining-room, which was furnished with divans, and presented a most comfortable appearance; but the heat and vapour were so extremely oppressive in the region of the bath, that we merely looked into it, and gladly returned to the cool gallery. I am not surprised that you are curious on the subject of the bath, and the eastern manner of using it; and I hope to devote a future letter to a description of the operation (for such indeed it may be styled), and the place in which that operation is performed. On our reaching the stairs, the second daughter of Habeeb Efendee took her sister's place; and with her arm round my neck, we descended the stairs, and re-entered the room where I had received so kind a reception. When we rose to take our leave, the elder daughter received my riding-dress from a slave, and was about to attire me, when her sister said, "You took them off; it is for me to put them on." The elder lady partly consented, retaining the habarrah, and thus they dressed me together. Then, after giving me the usual salutation, they each cordially pressed my hand, and kissed my cheek. We then descended into the court, attended by the ladies and a crowd of white slaves. Having crossed the court, we reached at the great gate, through which I had before seen, which was only closed by a large mat suspended

before it, forming the curtain of the harem. This mat was raised by black eunuchs, who poured from a passage without, and immediately after the ladies bade us farewell, and returned, followed by their slaves. The principal eunuch ascended first the mounting platform, and placed me on the donkey, while two others arranged my feet in the stirrups; our own servants being kept in the background. A few days after this visit I received a second invitation from this harem, with the polite assurance that they intended making a festival and fantasia for my amusement.'

Mrs Poole gives in her second volume a minute account of her visit to the apartments of the wives of no less a person than Mohammed Ali, the great pasha. Assuredly this is a curious subject for contemplation. Here we have an English lady paying morning visits to a Turkish harem, in which she is received on the most liberal and friendly footing. This is a simple fact to be regarded as a sign of the times by no means unimportant. It augurs the beginning of a friendly intercourse between the most distant nations, and a charitable toleration of opposite prejudices, which will in time produce the most beneficial results in every quarter of the globe where the same degree of intercommunion has been established.

We must not take leave of Mrs Poole without recommending her interesting work to general perusal. It is full of interesting facts, well and simply told.

SKETCHES IN NATURAL HISTORY.

THE CACTUS FAMILY.

'The monster cactus at Kew,' which has been the vegetable wonder of the newspapers for the last three months, has sent us a rambling—not exactly among the hills and ravines of tropical America with tin-case and root-hook—but amid histories, systems, and monographs, to glean something respecting the nature of this most curious and interesting family.

The majority of our readers must have some idea of the outward characters of the cacti; for they are now extensively cultivated in conservatories and on domestic flower-stands, either for the beauty of their evanescent blossoms, or for the singularity of their structures. To those who are not familiar with the physiognomy of the tribe, we would say—Go to the nearest botanic garden or private hothouse, and study for half an hour the aspect of the melon-cactus, with its globular spiny stem and woolly crest; of the old-man cactus, with its round oblong stalk so profusely covered with long white hairs, and so like the silvered head of age; of the opuntia, with its spiny tongue-shaped stems and branches springing from each other, and jointed together in more than Siamese brotherhood; of the creeping cereus, with its whip-like stems hanging down from the pot in which it is generally suspended—do this, and we guarantee the fixture in your mind's eye of an image not readily to be effaced, with the conviction at the same time that the cacti constitute one of the most singular and interesting orders of the vegetable kingdom. They are unique in their forms and habits, and meet with but very distant allies in any other of the fleshy-leaved orders. The aloe, house-leek, and pineapple tribes, are also characterised by thick fleshy members; but in them these members are true leaves, performing the regular functions of that organ. The little yellow flower of the house-leek is elevated on its own independent stem; and the flower-stalk of the Agave Americana rises from fifteen to thirty feet above the leaves which give it birth. Not so with the cacti: their leaves are either so rudimentary that they are scarcely discernible, or fall off from the young shoots almost as soon as they expand; their place being supplied by spines either solitary or in the form of star-like tufts and bunches. As plants, they are all stem and branch, appearing above ground as spiny tubercles; as globular masses, branching tongue-shaped bodies,

creeping snake-like stems dangling from the arid rock, angular zig-zag stalks of considerable height, as leaf upon leaf, or in other forms the most irregular and grotesque. Nor is this form stationary in the same individual; for as the stem consists chiefly of cellular tissue, with little woody fibre, it is peculiarly liable to sudden expansions and developments, so that however angular or compressed the branches of a plant may originally have been, the trunks become in time either perfectly cylindrical or with scarcely any visible angles. The flowers, which are white, scarlet, or purple, and often showy and attractive, spring in some species from the woolly crests of the stems, in some from the tufts of spines, and in others from the angular edges and clefts, as if the order was endowed with a reproductive power at every point of the surface. The fruit, like the flower, adheres to the stem, and might be taken for one of the fleshy lobes, were it not for its scarlet or purple colour; so concentrated and huddled together in this family are the stem, branches, leaves, flower, and fruit—organs which in most tribes are separate and well-defined. So much for the general characteristics of the cactaceæ; let us now glance at their distribution and habits, at their individual peculiarities, and economical uses.

All the species of cacti are said to be natives of tropical America; only a few having escaped to the southern states of North America, and to the highlands of Chili and Mendoza. This is rather a circumscribed range; for although the opuntias which cover the volcanic soil of Sicily may be justly regarded as exotics, we can scarcely consider the opuntias, rhipseas, and other cactaceous plants which are found in Central and Southern Africa as other than true natives. Be this as it may, the cacti grow chiefly on hot dry rocks or plains, where the commoner forms of vegetation could not exist, and may be considered as one of the means which nature has provided for the support of animals in regions where neither food nor water can be procured—their stems being filled with an abundant insipid wholesome juice, and their fruit being succulent, and of an agreeable acidulous flavour. To enable them to endure the excessive drought to which they are exposed, they are furnished with an unusually tough leathery skin, which has few, if any, evaporating pores. This envelope prevents the escape of what moisture their long penetrating roots may collect from the soil; and thus during the hottest season they are turgid with juice, while during the rainy season their turgidity breaks forth into new branches, buds, and flowers. No adaptation, indeed, could be more perfect than that of the cactus to the soil and seasonal influences of its native habitat. During the brief period of rain, it puts forth its shoots and blossoms with astonishing rapidity, the flowers of some species, as the *Cereus grandiflorus*, actually opening during night, and fading before the morning. On the return of the drought, the plant concentrates its vital energies, and becomes dormant; its pores are closed, and its skin toughens and thickens, to protect the nutritive juices from waste or injury. And here the cultivator of exotics may learn a useful lesson: were he to attempt to force such plants as the cactaceæ into a perpetual growth, he would speedily impair or exhaust their vitality; but by imitating the conditions under which they naturally grow—by keeping away the stimulant of combined heat and moisture, and by allowing them a season of dormancy and rest, he may preserve them in perfect health for generations.

Plants thus rooting themselves among fissured rocks and on arid shingle, or suspending their whip-like stems from the clefts of decayed trunks, may readily be supposed to be endowed with various means of reproduction, since the chances of soil and moisture are against them. Such, indeed, is the case. The cacti are propagated not only by their seed, but with amazing facility by their buds and branches. Take, for example, the branch or joint of an opuntia, dry it a little, place it in a hot damp place, no matter how scanty the soil, and it strikes root immediately. A jointed plant thus broken

asunder by the tread of a foot or the fall of a branch, is actually increased by the very accident which would be certain destruction to plants of a different order. Nay, each tuft of spines is a bud, and if the top of the plant be cut down or injured, every tuft swells and becomes a bud; every bud a branch, which, when detached, will strike root, and spring up into a new individual. Many hundreds, and even thousands of tufts, have been counted on a single gigantic cactus; so that, with a power of increase so enormous, we can readily account for the frequency and distribution of the order among the rocks and plains of Central America, notwithstanding the numerous severities of soil and climate to which they are subjected. Naturalists have descanted on the uses of the mosses and lichens in clothing the naked rock with soil; the cacti are also not without their importance in this respect, though operating in a somewhat different manner. De Candolle, in speaking of the opuntia, remarks, that it is employed to good purpose in fertilising the old lavas at the foot of Mount *Ætna*. 'As soon as a fissure is perceived, a branch or joint of an opuntia is stuck in; the latter pushes out roots, which are nourished by the rain that collects round them, or by whatever dust or remains of organic matter may have collected into a soil; these roots once developed, insinuate themselves into the most minute crevices, expand, and finally break up the lava into mere fragments. These fragments suffer further decomposition by exposure to the atmosphere and human culture, and so in time constitute the basis of a fertile soil.'

Regarding the peculiarities of the respective genera, little need be said, as these depend rather upon difference of form than on any essential distinction of habit or property. The order is usually divided by botanists into two sections—*Opuntiaceæ* and *Rhipsalidæ*—on account of a minute difference in the manner in which the seed is arranged within the fruit. That this distinction is unimportant in a general point of view, may be learned from the fact, that the first section comprehends all the genera save one—the solitary *Rhipsalis*, on which the second section is founded. The described genera are—*Cactus*, *Melocactus*, *Opuntia*, *Cereus*, *Mamillaria*, *Echinocactus*, *Epiphyllum*, and *Pereskia*, of which we may particularise the following:—The mamillaria, so called from the pap-like tubercles which cover its sub-cylindrical stem, is a common form in our conservatories. Each tubercle is covered with a little tuft of radiating spines, and the flowers which sit close to the stem are ranged in a kind of zone round the plant, giving it rather an elegant appearance. The melon-cactus, or Turk's cap, one of the most singularly formed, has a globose melon-shaped stem, covered with alternate furrows and ridges, the latter being armed with spiny tufts, which effectually guard the succulent parts from the depredations of animals. The stem is crowned by a woolly tuft—the tassels of the fancied cap—which bears the flowers and fruit. This genus delights in the most arid plains of America, and is often the only vegetable that gladdens the waste. It is found of all ages, and from the size of a hand-ball to that of the largest bomb. The wild horses are said to seek its refreshing juice when every vestige of external moisture has failed, striking asunder its succulent trunk with repeated blows of the forefoot—an operation which, from the dangerous nature of its spines, requires considerable address. The echinocactus, or hedgehog thistle, has also a globose stem, but wants the woolly head, and has its flowers springing from the tufts of spines which arm its ridges. It is to this genus that the 'monster at Kew' belongs, of whose history and dimensions we learn the following particulars from a recent number of the *Gardeners' Chronicle*:—

The gigantic cacti in the royal gardens—for it seems there are two—are the gift of Frederick Staines, Esq., of San Luis, Potosi, in compliment to whom one of them has been named *Echinocactus Stainesii*; and the other *E. Viznaga*, from a native word signifying twice pointed, in allusion to the character of its prickles. The

former was received towards the end of 1844, and the latter, which has been designated 'the monster,' par excellence, so recently as February 1845. Mr Staines made the discovery of this Titan in 1843, and thus announced his intention of sending him to England. 'I mean to have him deposited in a strong box, sending the box first to the mountain where the monster grows, and placing it on the springs of a carriage, which I shall despatch for that purpose, and so forward it to Vera Cruz. My monster friend cannot travel any other way, from his stupendous size and immense ponderosity, which cannot be accurately calculated here, where the largest machine for conveying weights does not pass 400 pounds. This enormous plant will require twenty men at least to place it upon the vehicle, with the aid of such levers as our Indians can invent upon the occasion. Should this huge specimen reach Kew, what must be your admiration on seeing it, when you express such delight on receiving the former one. The viznaga grows in the deep ravines of our loftiest mountains, amongst huge stones: the finest plants are inaccessible to wheeled vehicles, and even on horseback it is difficult to reach them. Still, I shall use my utmost endeavours to get a large one, and shall cause the palm-mats to be sewed most carefully round his huge and thorny circumference, before applying to his roots the crowbars destined to wrench him from his resting-place of unknown centuries. He will have to travel 300 leagues; and happy shall I be if I hear that the carriage has not broken down between this city and Mexico, through which capital he must pass on his way to Vera Cruz. These monsters are of a dark green colour, with formidable black spines, 3 inches long.' After various trials and difficulties—the breaking down of the carriage, and the impossibility of getting a proper box constructed for his reception—the cactus was brought down to Vera Cruz, packed as a bale, and shipped for England. 'It was on Saturday, February 15, 1845, that the viznaga, together with five large boxes filled with other individuals of the same tribe, and rarities of different kinds, reached the Botanic Gardens in a condition of security and vigour which were quite remarkable, considering their bulk and weight, the vast overland journey, mainly performed through a country of high mountains and perilous roads, and their arrival in our island during one of the severest frosts that had been experienced for many winters. This degree of safety can only be attributed to the extreme care that had been bestowed upon the packing, and the materials with which the specimens were surrounded. The large cactus was first surrounded with a dense clothing of the Spanish moss (*Tillandsia usneoides*), and well corded. Fifteen mats, each as large and as thick as an ordinary door-mat, and composed of the fibres of a palm sewn together, formed the exterior envelope. Freed from these incumbrances, the monster viznaga was seen as perfect, as green, and as uninjured, as if it had been that morning removed from its native rocks, the very long flagelliform roots arranged in coils like the cable of a ship. Ten of our strongest men with difficulty placed it in scales, to ascertain its precise weight; and afterwards, with still greater difficulty, transferred it perfectly unharmed to a tub prepared with suitable soil.' The net weight was 719 pounds; height from the surface of the earth, 4½ feet; measured over the top from the ground, on each side, 10½ feet; circumference at one foot from the ground, 8 feet 7 inches; number of ridges or costæ, 44; each ridge had 50 tufts of spines; and as in each tuft there are four spines, the total number must be 8800—no insignificant armature, when we remember that each spine is not less than 3 inches long. Compared with the ordinary growth of the globular cacti, the viznaga is a Titan indeed; the dimensions of the majority varying within the limits we have already mentioned.

Following out our detail, the next in order is the *Pilocereus*, or old-man cactus, so called from its resemblance, when of small size, to an old man's head, being covered

with long white hairs, which hang down like hoary locks. In our hothouses it is generally of small size; but in its native country it is said to attain the height of 12 or 15 feet, thereby losing its likeness to the object from which it has received its most familiar name. The Peruvian torch thistles (*Cereus Peruvianus* and *hazanensis*) are still more gigantic plants, often attaining a height of 40 feet, though their stems be not much thicker than a man's arm. The creeping cereus (*C. flagelliformis*) is well known from its long snake-like stems, which hang down from the sides of the suspended pots in which it is usually grown; and the night-flowering cereus (*C. grandiflorus*), the blossoms of which open during night, and fade before morning, has been long an object of attraction. It has an angular, branched, and clambering stem, which throws out roots at every joint, and has a magnificent flower; the rays of the calyx of a bright yellow when open, and the petals of the most delicate white. The flower-bud begins to open at seven or eight o'clock in the evening, is fully blown by eleven, and by three or four in the morning is faded and withered. The *Opuntias*, which are numerous and useful, are distinguished by their oblong, flat, leaf-like branches, united together by joints, and for the most part covered by spines. In Europe, the height they attain is insignificant; but in warmer regions they sometimes rise to 10 or 15 feet above the arid soil that supports them. In South Africa, Mr Backhouse saw an *opuntia* 10 feet high, with numerous branches, and covered with splendid yellow blossoms. Compared with the genera of the first section, the *Rhipsalis* is an insignificant plant, having a slender-jointed stem, not unlike the common rock samphire.

The economical value of the cactaceæ is not the least important feature in their history. Many of the species yield an esculent fruit, which partakes of that acidulous flavour so much esteemed in the gooseberry and currant family. The pulpy berry of the *Opuntia tuna*, which resembles in shape and size the fig of Europe, has gained for it the name of 'Indian fig'—a term by which the whole family is sometimes designated. This fruit forms a very refreshing repast in Spanish America and the West Indies; and that gathered from the common *opuntia* of *Ætna* is sold for a similar purpose in all the towns of Sicily. The fruit of the different species is known by such names as Indian fig, prickly pear, strawberry pear, &c.—the latter being the produce of a cereus, and the most highly-prized for its flavour and cooling properties. In Brazil, the *opuntias* are much planted round houses, as a fence which neither man nor animals can easily break through—a use to which we believe they are also applied in the south of Europe. When the island of St Christopher (St Kitts) was to be divided between the British and French, three rows of the *O. tuna* were planted by common consent to form the boundary. The chief importance of the cacti and *opuntias*, however, consists in their being the natural food of the cochineal insect—*coccus cacti*—so valuable in the arts. This insect, which is not unlike the meal-bug of our gardens, has the substance of the body coloured of a rich scarlet throughout; the richness of the dye depending upon the nature of the plant on which it feeds. The species in greatest repute is the *Opuntia coccifera*, or spineless cochineal fig, of which there are extensive plantations in Mexico and the West Indies, for the purpose of preparing cochineal. The male insect is winged; the female alone is used as a dye. There are two kinds of cochineal, which are reputed to feed on different species of cacti. One of these, the wild or common cochineal, is covered with a silky envelope, and is not so valuable as the cultivated sort, which has a powdery or mealy covering. The female insects, after feeding on the cacti for three or four months, are brushed off by means of a squirrel's tail, and are then killed by exposure either to the sun or to the vapour of hot water. When dried, they are exported in large quantities; and the colouring matter is easily extracted by water and alcohol, or hartshorn. It is

stated that 800,000 pounds of cochineal are annually brought to Europe; each pound containing about 70,000 insects. The annual consumption in Great Britain alone is estimated at upwards of 150,000 pounds; about £300,000 sterling. So valuable to man is an insect which ignorance would be apt to regard as mean and insignificant.

It is a curious consideration that two such important substances as silk and cochineal—the one adding beauty to the other's utility—should be the produce of small and apparently insignificant insects. The silkworm obtains its food from the mulberry; the cochineal insect feeds on the cactus. The *material* of silk and cochineal must exist in the vegetable structure; yet man, with all his boasted skill in chemical science, can neither imitate the fibre of the one nor the dye of the other. The animal chemistry of the tiny insect outstrips the most ambitious effort of the laboratory, as far as the works of nature will ever surpass the efforts of human art. The insect, however—and here lies the consoling distinction—in producing its finest fabric, merely obeys a law of nature which it cannot avoid; with man, every product is the result of intellectual skill and responsible reason.

From the preceding sketch, the reader may form some idea of this singular order of vegetation, and be enabled more fully to appreciate the merits of the giant *viçnaga* at Kew. To gaze at an object without some knowledge of its relations, properties, and uses, is mere senseless wonderment: we can only admire where we are sufficiently informed.

WRITING HISTORY FOR THE PEOPLE.

We have not for a long time met anything more entirely accordant with our own views upon a speculative subject, than certain remarks which the *Athenæum* quotes in a late number from a brief essay of M. de Lamartine, *On the Manner of Writing History for the People*. With thanks to our periodical brother for bringing these remarks under our attention, we transfer them entire to our own columns. Let our readers of every rank deeply ponder upon them.

"I have often said to myself what you say with so much good sense to your readers in the introduction to your useful book, 'After having equalised rights, we must equalise as nearly as possible intellects. The task of our times is to raise the masses to the conditions of civilisation; of that relative leisure and ease which may permit them to instruct themselves. A popular encyclopædia would be a peaceful revolution.' * * But in what spirit will you and your friends write a history for the use of the people? Popular writers have hitherto grossly flattered the people—a proof that they had no great esteem for them; for we flatter only those whom we seek to seduce. Why were they flattered? Because they were made an instrument, and not an end. Such writers said to themselves, The force is there: we want it to upset governments which constrain us, or to absorb countries which we covet: let us invite the people; let us intoxicate them with their own praises; let us tell them that right resides with numbers, that their will is justice, that God is on the side of great armies, that all means are good to secure the success of the popular cause, and that even crime is effaced by the grandeur and the sanctity of results. They will believe us, follow us, and lend us the physical force we need; and when, by the aid of their arms, their blood, and even their crimes, we shall have overthrown a despotism, and conquered Europe, we will dismiss them, and tell them in our turn, Be silent, work, and obey. This is the way in which they have hitherto been addressed; thus have the vices of courts been transported into the streets, and the people been inoculated with such a love of adulation, and such a craving for obsequiousness and caresses, that, like certain sovereigns of the Lower Empire, they would only be spoken to kneeling.

This is not the course to be pursued. We must speak to them erect, on a level, face to face. The people are neither better nor worse than the other elements of the nation; numbers are nothing. Take each of the individ-

find? The same ignorances, the same errors, the same passions, often the same vices, as elsewhere. Are these men before whom to kneel? No. Multiply all these ignorances, vices, passions, miserable weaknesses, by as many millions as you will, you will not change their nature. Let us leave talking of numbers, and respect only truth.

In writing history for the people, you must consider truth alone. And do not think that you will be less listened to, or less popular on that account: the people have indeed acquired a depraved taste for adulation and falsehood; but their natural tastes are for truth and courage. They respect those who dare to brave them, and despise those who fear them.

This being the case, what point of view will you select for writing your people's history? There are three principal views which you may take—that of glory, that of patriotism, and that of civilisation, or of the morality of the acts you are about to relate. If you consider an act under the aspect of glory, you will delight a warlike nation, which has been dazzled long before it has been enlightened, and which this false glitter has so often blinded as to the true value of the men and things which appeared in its horizon. If you place yourself in the exclusive point of view of its patriotism, you will excite all the enthusiasm of a people which pleads the excuse of its safety and its greatness for its lofty egotism, and which, in the feeling of its greatness and its strength, has sometimes forgotten that it was not alone in Europe. But neither of these points of view will give you the real truth—that is, the general truth; they will give you only the French truth. But French truth is true only at Paris; cross the frontier, and it is a lie. It is not this truth, circumscribed within the limits of a nation, that you wish to inculcate; it is not to this that you would bring down the intelligence of the people. What, then, remains? The universal and permanent point of view; that is to say, the point of view of the morality of the actions of the individuals or of the nations which you have to describe. All other aspects of the subject are enlightened by false or partial gleams: this alone stands in the full and divine light of day: this alone can guide the infirmity of human judgments through the labyrinth of personal or national prejudices, opinions, passions, interests, and enable a people to say—this is right; this is wrong; this is great or noble. In a word, if you wish to form the judgment of the masses, to rescue them from the immoral doctrine of success, do what has never been done yet—*give a conscience to history*. This is the work demanded for our age, and worthy of our people. By treating history thus, you will perhaps have less immediate popularity; you will not strike the passionate imagination of the masses; but you will render a thousand times better service to their cause, their interests, and their reason.

To give an example: one of the great events of the age—one of those days which divide for a length of time the fate of a revolution, of a nation, or of an empire—was the 18th Brumaire. You would doubtless have to relate it: how would you contemplate it? Should it be under the aspect of glory? That is dazzling; it glitters like a drawn sword in the sun; it whirls like the dust raised by a squadron of horse galloping by, filling the ear with noise and the eye with *éclat*! Here is a man coming from distant camps, preceded by his name, strong in his renown, accustomed to military discipline, weary of the tardiness, the resistance, and the inconvenient noise of a government of discussion; who, impatient of the slow and collective work of establishing liberty, takes advantage of a momentary discouragement of the public mind, mounts his horse at the head of a few grenadiers, breaks all this republican machine with his sword, and says, "Give me the empire; you can only talk, I will act." He succeeds; the revolution falls into his hands; he transforms it at his will: incapable of constituting the disordered elements into a nation, he forms them into an army, launches it against the world, intoxicates it with victories, and seizes the crown it tenders him. This is very fine. Make this glitter in the eyes of the masses—they will be dazzled by it: will you have instructed them?

Or will you contemplate the same event in the patriotic point of view? It is the universal monarchy of the French flag; the people sees itself everywhere under the image of its victorious armies; French patriotism appears vast as the continent of Europe, and exclaims, "L'Europe c'est moi;" it deifies itself. By presenting the fact thus, you will excite the people to enthusiasm for an event which has robbed them of all the fruits of the revolution before

they were ripe, and of all the moral conquests of the eighteenth century. Will you have elevated their character?

Lastly, will you view this same event under the aspect of the morality of the act and of its influence on true civilisation? It completely changes. There is a man to whom the free government of his country has intrusted an army for its defence against factions, and who converts that army into a military faction against that government. Here is an anarchical and bloody revolution, which by the sheer force of the public mind, and the spontaneous course of civil reactions, had traversed the most deplorable crises, and washed its hands with shame of the blood odiously shed; and whose violent oscillations daily became more temperate, and showed a tendency to confine themselves within the limits of a vital but regular motion. This man comes and stops the revolutionary movement exactly at the point where it ceased to be convulsive, and began to be creative. He arms himself with all the repentances, the resentments, the apostacies, which a revolution always leaves in its train; he reconstitutes an *ancien régime* with names and things of yesterday; he imposes a censorship on the press, and silence on the tribune; creates a nobility of plebeians, and converts religion into a tool of government. He stifles throughout Europe all sympathy with French ideas, under the hatred inspired by violence and conquest. What is the result of this drama with one actor? You see. A name the more in history; but France twice invaded, and her boundaries narrowed from without and from within—reason, liberty, and the improvement of the masses indefinitely retarded by this episode of glory, and condemned, perhaps, to pass a century in recovering what it lost in a day. Such is the 18th Brumaire under its three aspects. Need I tell you which is mine?

You may treat every incident of the French Revolution in the same manner: you will, in every case, find these three aspects: the purely individual—glory; the exclusively national—patriotism; and the moral—civilisation. And if you follow out the consequences logically, you will invariably arrive at this result, that glory and patriotism, severed from general morality, are sterile for a particular nation as well as for humanity at large.

To teach the people by facts, by events, by the hidden meaning of those great historic dramas of which men see only the scenes and the actors, but whose plot is contrived by an invisible hand; to teach them to know, to judge, to moderate themselves; to make them capable of distinguishing those who serve from those who mislead them, those who dazzle from those who enlighten; to point to every great man or great event of their own history, and say, Weigh them yourselves, not with the false weights of your passions of a day—your prejudices, your anger, your national vanity, your narrow patriotism—but with the just weights of the universal conscience of the human race, and the utility of the act to the cause of civilisation; to convince them that every nation has its post, its part assigned to it, every class of society its relative importance in the sight of God; to teach the people hence to respect themselves, and to participate religiously, and with full consciousness of what they are doing, in the progressive accomplishment of the great designs of Providence; in a word, to create in them a moral sense, and to exercise that moral sense on great events and men of their history, and on themselves; I venture to say that this were to give the people much more than empire, power, or government: it were to give them conscience; the judgment and the sovereignty of themselves: it were to place them above all governments; for, indeed, the very day on which they are fit to reign, they will reign—it signifies little under what form or what name. It is the people that must be modified; governments will modify themselves after its image; for be assured, as is the people, so is the government; and when a people complains of its own, it is because it is unworthy to have another. This was the opinion of Tacitus in his days, and it is equally true in our own.

OATMEAL MORE NUTRITIOUS THAN WHEAT.

The following playful comparison between the relative alimentary powers of oatmeal and wheaten flour, is copied from a useful article on Practical Agriculture in Blackwood's Magazine for March:—Professor Johnston, in the recent edition of his Elements of Agricultural Chemistry and Geology, tells us that, from experiments made in the

laboratory of the Agricultural Chemistry Association of Scotland, it turns out that oats are far richer in muscular matter, fat, and starch, than the best wheat flour grown in any part of England—that they contain eighteen or twenty per cent. of that which forms muscle, five to eight of fat, and sixty-five of starch. The account, therefore, between shelled oats (groats) and fine wheaten flour stands thus. One hundred pounds of each contain—

	Wheat.	Oats.
Muscular matter,	10 lbs.	18 lbs.
Fat,	3 . . .	6 . . .
Starch,	50 . . .	65 . . .
	63 lbs.	89 lbs.

What do you say to these numbers, Mr Cockney? You won't pity us, Scotch oatmeal-eaters, any more, we guess. Experience and science are both on our side. What makes your race-horses the best in the world, may be expected to make our peasantry the best too. We offer you, therefore, a fair bet. You shall take ten English ploughmen, and feed them upon two pounds and a half of wheaten flour a-day, and we shall take as many Scotch ploughmen, and feed them upon the same weight of oatmeal a-day—if they can eat so much, for that is doubtful—and we shall back our men against yours for any sum you like. They shall walk, run, work—or fight you, if you like it—and they shall thrash you to your heart's content. We should like to convince you that Scotch parritch has some real solid metal in it. We back the oatcake and the porridge against all the wheaten messes in the world. We defy your homemade bread, your bakers' bread, your household bread, your leaven bread, and your brown Georges—your fancy bread and your raisin bread—your baps, rolls, scones, muffins, crumpets, and cookies—your bricks, biscuits, bakes, and rusk—your Bath buns and your Sally Luns—your tea-cakes, and saffron-cakes, and alim-cakes, and plank-cakes, and pan-cakes, and soda-cakes, and currant-cakes, and sponge-cakes, and seed-cakes, and girdle-cakes, and singing-himms—your shortbread and your currant-buns—and if there be any other names by which you designate your wheaten abominations, we defy and detest them all. We swear by the oatcake and the porridge, the substantial hannock and the brose—long may Scotland produce them, and Scotchmen live and fight upon them!

PURSUIT OF KNOWLEDGE.

He that enlarges his curiosity after the works of nature, demonstrably multiplies the inlets to happiness; therefore we should cherish ardour in the pursuit of useful knowledge, and remember that a blighted spring makes a barren year, and that the vernal flowers, however beautiful and gay, are only intended by nature as preparatives to autumnal fruits.—*Johnson*.

SONNET.

BY S. W. PARTRIDGE.

Urging with queenly grace her upward way
Through the blue lonely sky, night's mateless queen
Lights up the landscape with her silver sheen,
And gladdens all around with softened ray.
On the cold pearly ground the shadows play;
The dusky trees in gloomy grandeur lean
O'er the gray moveless stream in sleep serene;
And all things dream the silent hours away.
Vision of beauty, my poor senses reel,
Intoxicated with thy witchery:
My heart o'erbrims with joy; and yet I sigh,
Such hushing melancholy awe I feel!
Alas that drowsy sleep should o'er me steal,
And to thy charms seal up my ravished eye.

We are occasionally asked by correspondents why they cannot obtain title-pages and tables of contents for the volumes of our Miscellany of Useful and Entertaining Tracts. In reply to these inquiries, we beg to say that titles and contents at the price of a number can always be had from the booksellers. Any bookseller who has not got them, can be supplied on demand.

Printed by William Bradbury, of No. 6, York Place, and Frederick Mullett Esdaile, of No. 7, Church Lane, both of St. Paul's Navigation, in the vicinity of Mile End, near the office, Lombard Street, in the parish of Whitechapel, and city of London; and Published (with permission of the Proprietors, W. and A. CHAMBERS), by WILLIAM SOMERVILLE, ORR, Publisher, of 2, Abchurch Lane, at No. 2, ABERN CORMICK, both in the parish of Church Lane, and in the city of London.—Saturday, April 12, 1846.

PRICE 1½d.

THE VISITATION OF RICHES.

A VERY alarming consideration has lately been presented to the people of England, who once dreamt not of ever suffering from such a cause—namely, that they are getting too rich. The true source of the manifold evils of our state is at length discovered to be, that we have far too much money. Individuals have too much money, and are greatly the worse of it. The community, as a community, has too much money, and daily suffers unheard-of misery in consequence. It is a terrible business. Charles Lamb, when reminded by his sister of the days when they were poor, and capable of enjoying every little treat with the keenest relish, so different from these days when they were rich, stately, and dull, said, 'Well, Bridget, since we are in easy circumstances, we must just endeavour to put up with it.' But, I fear, no such maxims of resignation will now avail in either the particular or the general case. It is not ennui which has come with affluence—no; somehow, this abundance of capital is now found to be attended with a small amount of positive mischief. Political writers declaim day by day on the dismal effects of wealth upon the poor, and professors of light literature find themselves weighed down with a sense of the turpitude of all rich men. Men are compelled to work, because there is money to be had for it—a thing heretofore unheard of in this world. Every man that has anything, necessarily becomes depraved in himself, and a tyrant over others. And, unfortunately, so prevalent has wealth become, that if you would seek for any vestige of the virtues in England, you have to look for it in persons who used to be thought almost too humble and obscure for notice long ago; such as ultra-ragged street-porters, and that selection of the rural population who take to poaching. In short, England, once the envy of surrounding nations on political grounds, is rapidly becoming an object fit only for their pity and contempt through the efficacy of this disease of wealth. Powerful remedies are required, and if such be not speedily applied, it is to be feared that all will soon go to wreck, and the sun of British glory, as the newspapers have it, set for ever.

In these terrible circumstances, it becomes all who wish well to their country to exert themselves to the utmost in its behalf. So feeling, I am anxious here to set down a few observations upon the subject, which I think may just possibly be found of some service. I am a plain man, who always go straight to the point when I can; and it therefore occurs to me, as the first expedient, to set forth to my countrymen a strong warning on the sin and danger of getting rich. They must for the future avoid this error, if they would see their country rescued from impending ruin, or themselves saved from being altogether demoralised. It might

form a strong inducement to them to abstain from money-making, if they would only consider that, so long as they remain poor, and of no account in the world, they will be held poetically entitled to possess every excellence; whereas, if they add to their store of goods, they are sure to become cold-blooded, heartless wretches, fit for nothing but to be impaled in the anatomical museum of modern fiction. Indeed, were things properly understood, we should be seeing the comfortable millionaires of the city—going about, I was going to say, like the characters in the play of the Bottle Imp, endeavouring to get others to take upon them the burden of their wealth; but this, I now reflect, were a vain endeavour, seeing that no one could, in such circumstances, be induced to relieve them of the load—trying, then, to destroy this wealth so effectually, that it should be hurtful to no other men. We should see nobles and country gentlemen surrendering their possessions to be employed as commons, and well-beneficed clergymen returning to a state of apostolical simplicity. Such a thing as a rich old bachelor uncle should not be known upon earth: all they have should, with full consent of nephews and nieces, be thrown into the sea. In short, there should be a universal retrogression to that beautiful and happy state in which our painted forefathers were about two thousand years ago. This is taking a somewhat strong view, and perhaps, constituted as the public mind now is, it cannot be hoped that any but those who are in the last extreme of poverty already will go so far. We must take men as we find them, and be content to get them along with us on a right course as far as they will go. I can see nothing, however, to prevent us from putting a stop to the further acquisition of wealth, seeing that all are agreed that depravity is the certain fate of those who have much more than themselves. Everybody will naturally see it to be right that he should stop short in that career in which he finds all who have got before himself to be marked by the most detestable qualities that belong to human nature.

It is an awkward thing to ask of an Englishman; but yet, let it be ever so awkward, I must ask it, for it is indispensable. Henceforth let them pause at every thing which appears before them in the form of an 'opening.' An Englishman naturally likes an opening. It is his grand temptation. But let him look through the opening, and see what is beyond. He will there behold a number of persons who, having gone into it, are now affluent, but at the same time extremely bad. Perhaps they are 'guardians,' who of course grind the poor; perhaps justices, who condemn vagrants possessed of more honourable feelings than themselves; perhaps patrons of charities, who are necessarily mere bags of the wind of vanity, using the objects of their beneficence only as instruments for promoting their own

honour and glory, and not possessing a single particle of the true spirit of good deeds. Think how dreadful it would be to rise into such conditions as these—think, pause; remain content where you are. You could take the state, and resist its temptations! Ay, so all think before they enter on the fatal road; but yet they invariably become the hardened selfish vain wretches which you see; and how can you suppose that it is to be otherwise with you? No, no, my friends. Lay no such flattering unction to your souls. Depend upon it, the moment you step beyond the state of immaculate indigence in which a kind Providence has placed you, you become changed men. Every trace of goodness forsakes you, and you stand, in the eyes of contemporary moralists, as only so much dross.

So much for private measures; but surely, if the evils in question be so clear, we may expect ere long to see them brought under the sage notice of parliament. This body has always shown a remarkable anxiety to take away the peccant matter of the disease, and undoubtedly it would exert itself to greater purpose than ever for the depletion of the nation's system, if necessary. A country, indeed, with such a government as ours, ought never to be at any loss, one would say, for phlebotomy, and I therefore believe that the petitions required to bring the attention of parliament to this point, would be much fewer than is customary. Having once heard the national will upon the subject, the senate would doubtless quickly pass an act enforcing voluntary impoverishment all over the empire; another for preventing any man from making more than what he can fairly consume in meat and drink day by day. All just and proper quarrels with bread and butter, such as strikes, short work, and the laying aside of female labour, would at the same time be legislatively encouraged to the uttermost, and, in short, everything done to maintain the righteous cause of poverty against all contrary influences and tendencies. The first effect would undoubtedly be to reduce the population of the country to something like what it was in the days of King Vortigern; but what of that? A short though sharp evil would be well worth encountering, where the ultimate results were of so promising a kind. A fair start in a new national career, free from the accursed presence of gold, would be worth purchasing at any expense. Only let us take care, both as individuals and as a nation, never to grow rich any more.

But can we expect that the people are to call upon the legislature for any such measures? There is the point. With a few popular authors at the head of the movement, setting an example by consenting to abjure all profits from their works beyond what might have sustained an ancient Spartan, I would not despair. Are my suggestions pronounced impracticable, and are we still to see the ideas, Englishman and wealth, in unholy conjunction; are the Crosses of the Exchange and the factories still to be ogres of our maturer childhood; and must we never hope to see the days of primeval simplicity restored? Be it so. If the evil must be, let us endeavour, in the spirit of Charles Lamb, to put up with it; the more so that we are not without something to compensate it on the other side. For it is a beautiful feature of our present condition, that, just as there is an extreme of society who are corrupted by wealth, so is there another which derives the highest lustre from poverty. Not the poverty which our fathers used to speak of as respectable; namely, that of honest men toiling for their daily bread, and eating it in independence, but the poverty which is attended by a practical contempt for such mean virtues as prudence, and is at constant war with the detestable house of Have. Seeing things thus balanced, we may yet hope that England will at least be able to rub on for a few more generations. She will have many sons who, spite of everything, will continue to make money, and contrive to abide by its lamentable consequences; she will see these men withholding the least share of their abundance from workhouses, hospitals, and other modes of

succouring the poor, in practice among less wealth-corrupted nations. Her Bowleys, her Cutes, and her Fillers, will be base, besotted wretches, disgracing her name. But then she will have a great fund of excellence among those classes who, in other countries, are usually held as vile, and the honour of the British name, which once lay in her high-spirited gentlemen and her honourable burghers, will be upheld by her mendicants and male-factors.

POPULAR INFORMATION ON SCIENCE.

MORPHOLOGY.

ONE of the most curious doctrines connected with vegetable life, is that which affirms that all the parts of a plant—stem, branches, flower, fruit, and seed—are but various modifications of one common organ; namely, the leaf. This view was first broached by Linnaeus, improved upon by Wolff, and subsequently expounded by the German poet Goethe. It is to the latter that we are mainly indebted for the exposition of the doctrine: he it was that clothed it with a poetic mystery, and sung in glowing language the series of developments which takes place between the germination of the seed and the ripening of the fruit. His reasoning proceeds upon the basis, that if one organ can be transformed into another, there is an identity in their origin and nature. If, for example, leaves are sometimes converted into bracts, bracts into a calyx, and the calyx into a corolla, then it is almost self-evident that the corolla, calyx, and bracts, have the same origin as the leaves. Let us glance at the facts by which this doctrine is sought to be established.

Varied as are the forms and properties of plants, the plan upon which their development proceeds is simple in the extreme. Growth is but a modification of one kind of tissue, and one kind of external organ. Every plant in the embryo or seed state consists of minute spherical cells possessing vitality—these constitute its elementary tissue. If the seed be planted under favourable conditions of soil, heat, and moisture, the cells will be excited to growth; that is, they will give birth to new cells, these again to other cellules, and so on, till the principle of vitality be exhausted. In this process the cells develop themselves variously—some by their elongation giving rise to woody fibre, some by the manner of their arrangement to spiral vessels, and others merely to cells like themselves—thus forming the different vessels, fibres, &c. of which the substance of the plant is composed, and through which its sap is conveyed and disseminated. So far as the mere elementary tissue is concerned, there might or might not have been any external organs; that is, parts assuming a definite form, and having a definite function assigned them; and such is the case with many of the lower fungi and lichens, which are mere irregular aggregations of spherical cells. In the higher orders of vegetation—and it is of these that we are now speaking—nature has decreed otherwise. A plant must require must receive nourishment from the air as well as from the soil, and must accordingly have a structure fitted to perform these functions. At the dawn of its development, therefore, the elementary tissue expands into a certain form or structure, which we regard as primary. This form we designate a *leaf*: it is that which first presents itself on the germination of a seed: it is the first effort of the elementary tissue; and all subsequent effects are but special modifications of the original. Such is the simple plan upon which vegetable development takes place. The whole substance of a plant is modified cellular tissue; all its external organs of branch, flower, fruit, but modifications of one organ—the leaf. Indeed the growth of all living matter, whether vegetable or animal, is based upon cellular development; and find also in the higher animals that their various external organs are but metamorphosed forms of one common type. Take, for example, the fore-leg or arm of the tetrata, assuming that of man as the type, and observe how differently it is formed in the monkey, the bear, horse, the cow, the bat, and the wing of the pigeon.

skeleton of the pigeon's wing and the leg of the bear are nevertheless formed upon the same plan as the arm of man, each being but modifications of the same organ, according to the destined habits of the animal. Skilful anatomists can detect the corresponding bones in each, can say where development is directed from the normal type, can tell what parts are atrophied, and what peculiarly expanded. So it is with the botanist; he can detect the leaf-type in all the members of a plant, be these spines, bracts, petals, stamens, or pistils.

The first protrusion of the seed-germ is leaf-like; subsequently true leaves are developed; and the elementary tissue, in its effort to produce a succession of these, forms the stem. The branches of the stem take their origin from leaf-buds, and these again are clothed with branchlets and leaves by the same process as the main stem. As a branch proceeds towards the point of fructification, the leaves assume the form of bracts; these again are succeeded by the leaf-like sepals of the calyx; and next by the petals of the corolla or blossom. Within the petals are the stamens, which sometimes assume a leafy form; next the pistil, which is often leafy; and ultimately the seed-vessels, which almost always bear internal evidence of their being composed of peculiarly altered leaves. Even the seeds are but leaves in another form, embalmed and preserved for the production of another plant; and in many, such as the beech-mast, the leaflets of the embryo may be distinctly seen, folded and imbedded in their future nutriment.

'Here root, and leaf, and bud, enfolded lie
Enshrined within their husky tenement
Incipient foretypes of the coming plant;
In silent life, half-formed and colourless;
But soon again, replete with earth-given moisture,
The leaf expands above surrounding night,
And breathes the incense of the open day.'

Thus the growth and reproduction of plants may be regarded as a circle of leaf-like changes, the leaf, or some modification of it, being in all cases the organ which administers to the functions of vitality. The great object of a plant's life is to preserve, during all the phases of its growth, a leaf, or an assemblage of leaves, for the purpose of reproduction. A growing branch terminates in a leaf-bud; that is, in a number of embryo leaves folded over the vital point, and carefully covered with scales or gummy matter, to protect them from the inclemency of the winter: a branch in which development is exhausted terminates in flower and seed. And mark how beautifully the latter is produced! The branch that had hitherto luxuriantly given birth to leaves, suddenly ceases to prolong itself; the leaves are developed more closely to each other; and gradually they lose the form of true leaves, and become bracts; the bracts are succeeded by the little leaf-like sepals of the calyx, which are set together still more closely, and in a circular form; the leafy petals of the corolla succeed, and are followed by the stamens and pistil, all of which circle inwards to a common centre, that centre being the ovary and seed. The seed is the ultimate effort in this case, just as the leaf-bud was in the other, and is merely a leaf, or couple of leaves curiously folded, imbedded in proper nutriment, and protected by a husk, a nut, a stony drupe, or some other covering, as safely and tenderly as a mother would her infant. The leaf-bud and seed differ only in the latter being a more concentrated form of vitality. The bud can only exist in connexion with a living plant; the seed, when matured, will endure for centuries. In the leaf-bud, the energies of the plant are more directed to the increase of the individual; in the seed they are directed towards the propagation of the species.

We have further proof of the truth of morphology in the fact, that all the organs—leaves, sepals, petals, stamens, &c.—are often found assuming the forms and functions of one another. Thus in some roses the bracts are exactly similar to the leaves, while in the tulip they frequently partake both of the colour and texture of the sepals, as well as of the texture of the leaf. Again, that there is no essential difference between the sepals of the

sepals being frequently coloured, and forming the most beautiful portion of the blossom. In the monkshood, the blue part which forms the flower is botanically the calyx, the petals being entirely concealed under the hood. In the fuchsia, the bright scarlet part is the calyx, and the small purple petals within, the corolla; while in the tulip and crocus the sepals and petals are all coloured alike, so that it would be impossible to distinguish one from the other, did not the sepals grow a little lower on the stem. In some plants the petals and sepals are identical in colour, texture, and odour; and when the perianth is single, these parts seem to be combined. In like manner there is no physiological difference between the petals and leaves. Both have a framework of veins, the interstices of which are filled up with cellular tissue; and both have an epidermis furnished with pores for absorption and respiration. The absolute change of leaves into sepals, and thence into petals, may be occasionally seen in the tulip, the bracts or floral leaves of which are sometimes partially coloured like the proper petals of the flower; or, conversely, the sepals may be often seen presenting the appearance of true leaves; as in the rose, which has sometimes a ring of leaves instead of sepals; or in the polyanthus, whose brown corolla is often surrounded by common leaves. The construction and arrangement of the stamens also point to the same leafy origin. These have occasionally their filaments dilated and leaf-like, as in the white water-lily; and in many cases—such as the double roses, anemones, and ranunculuses—a transition is observable from the outer petals of the corolla to the true stamens; the petals gradually becoming smaller, and ultimately assuming the colour and form of the latter. The pistil and ovary seem formed in the same way by the metamorphosis and union of leaves. Many pistils have a laminated or blade-like shape, and the stigma of some, such as the iris, is leafy. The leafy origin of the seed-vessel is still more perceptible—a follicle or legume, as the pea, being evidently composed of two leaves folded and adhering at the edges. These pods, indeed, sometimes reassume the leafy form, and, instead of seeds, produce along their edges a number of expanded lobes. Even the fleshy apple is but a number of leaves metamorphosed by an increase of cellular tissue, and united so as to form one continuous mass. The leafy origin of fleshy fruits is often very distinct when newly formed, or when by some accident they are rendered abortive at this stage. Nor does this leaf-like circle end with the seed-vessel. Let any one carefully dissect an apple, and he will find that it is not only composed of five leaves united and enlarged by increase of cellular tissue, but that it has in the axil of these leaves a seed or seeds, each composed of two lobes or cotyledons, prepared to commence the circle anew when the season of growth returns.

What are called monstrosities in flowers, furnish another evidence that the floral appendages are merely modifications of the leaf, or at least that the same structure is common to both. These monstrosities generally arise from some accidental circumstance operating, so as to change the flower-bud into a leaf-bud during the germination of the flower. Thus, if a plant be supplied with abundance of moisture and warmth, but with little sunlight, the growing point will be developed into a bud in the centre of the flower, and sometimes a second blossom will be produced at the extremity. A further confirmation of the common origin of the flower and leaf is afforded by the fact, that fuchsias are sometimes found with the flowers half leaves, and the leaves half flowers. One of the properties of the leaf is to produce branches from its axil, or angle which it forms with the stem. The same property is often observable in the sepals, and not unfrequently in the petals, as, for example, in the common pimpernel. In the *Gardener's Chronicle* for May 1844, a flower of this plant is figured with two of the petals producing young shoots, in no way distinguishable from the shoots which proceed from the axils of the true leaves. We have thus, without direct evidence, every cause for suspecting that the petals are nothing but modified leaves. We also know that removing a wild plant,

as the dog-rose, into a garden, has a tendency to make the flowers double, because enough of cellular tissue is produced to convert the stamens into petals. Leaves and branches are frequently transformed into spines and thorns. Indeed thorns are regarded as leaf-buds which have been rendered abortive by some accidental stoppage of the sap, which prevents the addition of cellular tissue to form perfect leaves. Branches which also take their origin from leaf-buds may be arrested at a certain stage of their growth, so as to form spines instead of perfect branches; and such spines not unfrequently give birth to new leaf-buds and leaves, as may be seen in the common hedge-thorn. 'We see, therefore,' says Dr Lindley, in winding up this curious subject, 'that there is not only a continuous uninterrupted passage from the leaves to the bracts, from bracts to calyx, from calyx to corolla, from corolla to stamens, and from stamens to pistil—from which circumstance alone the origin of all these organs might have been referred to the leaves—but there is also a continuous tendency to revert to the form of the leaf.'

The preceding is a rapid glance at the leading principles of morphology, which, when thoroughly understood, exhibit the whole plan of vegetable growth in the utmost simplicity and uniformity. Increase of substance, in whatever part, is but cellular development; multiplicity of form and organisation, mere modification of the leaf. Or we may regard the leaf as the individual, and the entire plant as an assemblage of individuals—each set being modified according to the functions they have to perform. There is certainly nothing more incredible in the statement of these modifications, than there is in the well-known morphosis of the frog from the tadpole, or of the butterfly from the successive stages of caterpillar and chrysalis. The drone, working-bee, and queen-bee, differ in structure according to the functions they are destined to execute; yet they can be transformed into each other, proving that they are but modifications of one common form. So it is with the leaves of plants; one set administers to the process of growth, another to defence, and a third to the functions of reproduction—each assuming a form suitable to its appointed office. Nature is never prodigal of her resources: by the slightest modifications of one great design, she can produce a thousand different results; and thus it is that in creation we find the greatest variety with the utmost simplicity, and in time the most gigantic results from movements all but imperceptible.

EL COLL DE BALAGUER.

A MODERN CATALONIAN STORY.

THE road from Barcelona to Valencia passes over the skirt of a cordillera, or mountain ridge, known by the name of El Coll de Balaguer. This road is edged by the sea on one side and the Coll on the other; and at one point especially, where there is an elbow or short turn, there are several enormous blocks of stone, which appear to have become detached from the main rock, and to have lodged in situations exactly suitable for the concealment of banditti, and affording facilities for pouncing upon the unsuspecting traveller from the narrow passages by which they are separated.

Between the years 1828 and 1831, several robberies and assassinations had been perpetrated close to this spot; and six rude crosses, erected within a very short distance of each other, were sad mementos of the fact. All these murders had been accompanied by circumstances marked by a singular similarity. The first victim who perished in this dreaded neighbourhood was a rich merchant, who was travelling from Lérida to Tortosa. It was supposed that, having had occasion to transact business in places out of the direct road, he had branched off, and had joined the Barcelona route near the Coll de Balaguer. He was seen one afternoon riding along on his mule in that direction, and early on the following morning a mendicant friar found his dead body, bathed in blood. A bullet had struck him in the forehead, just between the eyes. His

money and other light valuables were gone; but the assassin appeared to have disdained to take any other part of his property, for his mule was quietly cropping the scanty grass a short distance off, and the little port-manteau was still strapped on the crupper pad. A remarkable as well as unaccountable circumstance attending this catastrophe was, that a roughly-fashioned wooden cross had been placed in the clasped hands of the murdered merchant. The most prompt and diligent steps were taken, under the direction of the authorities, for the discovery of the assassin, but without effect.

Seven months afterwards, on the eve of the festival of San Hilarión, in the month of October, a dealer—who had been to Barcelona to dispose of a large quantity of Segovia wool, and who was on his way to Murcia with a considerable sum of money in his possession—was robbed and murdered near the Coll de Balaguer; and about the middle of the following year, Don Andres Escoriassa, a manufacturer of firearms, was found dead at the same place.

In February 1830, a pedlar named Zoannof, who had been selling his wares in different parts of the country, commencing his traffic in Navarre and ending in Catalonia, when on his road from Barcelona to Tortosa, in order to return to the north by one of the passage-boats which ascend the Ebro, was also killed by a bullet near the fatal spot; and eight days before the festival of Todos los Santos, or All-Saints, in the same year, Antonio P. Dirba, a contrabandista, and also a great sportsman, who had that very morning succeeded in smuggling a cargo of French tobacco on that part of the coast, was assassinated, evidently without having had an opportunity of defending himself; for the *trabuco* or blunderbuss, with which he was armed, was still loaded, and lying beside his corpse.

In January 1831, the dead body of a person named Nervas y Alaves, who had been selling a lot of liquorice juice at Tortosa, was discovered at El Coll de Balaguer.

These six victims had all been rifled of their money alone, and all had been mortally struck with equal good aim by a single bullet. Moreover, each was found with a rough wooden cross fixed in his lifeless hands.

The Coll de Balaguer became, as may naturally be supposed, the terror of travellers, as well as of the surrounding country, in consequence of these murderous waylayings; and few persons had the hardihood to travel by that route, unless they were numerous and stoutly accompanied. Many whose affairs called them from Barcelona to Tortosa and Valencia, diverged from the high road, and willingly encountered the toil and inconvenience of making a circuit of several leagues over rugged paths, regaining that high road at a safe distance from the dreaded Coll de Balaguer.

Some goat-herds, who had occasionally conducted their flocks to browse upon the mountain herbage near the spot, declared that they had found some faded flowers which had been deposited by an unknown hand at the foot of each of the six wooden crosses which marked the burial places of the murdered travellers, and they went so far as to add, that at sunset they had more than once descried a tall figure enveloped in a cloak gliding along until it arrived close to the crosses, when it sank on its knees, and appeared absorbed in prayer; but that upon their approach, it suddenly vanished. They also imagined that they had occasionally heard doleful groans and sobs, apparently proceeding from some person in grief or suffering, at the foot of the Coll. Under these mysterious circumstances, he would have been a bold man who would venture to pass that spot alone after nightfall.

A few years antecedent to these startling events, a person named Venceslas Uriarte took up his residence in the environs of Tortosa. He was not a Catalanian, and his previous history was unknown in those parts. It was rumoured, however, that before the revolution of 1822, when the Inquisition was abolished, he had been *alcáide*, or jailer, in some prison belonging to that dread tribunal. According to his own account, he had

served in what was called the Army of the Faith, a body of implacable fanatics, who hesitated at no means, however astute or cruel, to endeavour to perpetuate a system which had been for ages the bane of domestic felicity, the curb to rising intelligence, and the fosterer of the most evil passions.

That baleful system having at length been resisted in the most determined manner by the mass of the Spanish people, the majority of its agents and abettors had either fallen in the various encounters between the constitutional forces and those of the Army of the Faith, or had emigrated to France, Italy, and other countries, whilst considerable numbers dispersed themselves in various parts of Spain, where they were generally regarded with suspicion and hatred, not unmingled with fear, in spite of their prostrate position; for they bore the indelible stamp of beings who had been in the habit of perpetrating crimes of the very deepest dye, either in the dungeons of the Inquisition, where none but the monsters in human form who tortured their victims in secret could hear their shrieks for mercy; or in districts which the Army of the Faith had held under its domination, persecuting and castigating those whose words, actions, or even looks, could be so distorted or misinterpreted as to be made the groundwork of a suspicion.

This Venceslas Uriarte's habits were expensive; but the source whence he drew his pecuniary supplies was unknown; and although he practised all the outward forms of religion with scrupulous exactitude, and had, on that account, gained a certain reputation for piety in some quarters, he was generally looked upon as a dangerous person. Strange and ominous expressions, fearfully indicating that he was familiar with crime, escaped his lips in unguarded moments; and he gave way occasionally to the most furious bursts of passion in altercations with his associates, his vengeful glances causing the bystanders to tremble lest he should put an end to the dispute in some violent and tragical manner. Nor were their fears groundless, although the fatal blow might not be struck in their presence. The following instances are characteristic of the man:—

Some one having asked him how it was that, being so excellent a shot, he so seldom went out for a day's sport, his reply was—'To find a hare, it is necessary to undergo fatigue. Then, if you shoot it, you must run some little distance to pick it up; and you must afterwards walk a long way if you wish to sell it. 'Tis much better to wait for a man; he comes of his own accord; and when you have killed him, all you have to do is to ransack his *alforjas* [saddle-bags.]

One day, however, he went to shoot wild-fowl in company with Antonio P. Dirba, the contrabandista, to Los Alfaques, which are a cluster of small islands or banks near the mouth of the Ebro, thickly overgrown with tall reeds, and which afford shelter to great numbers of wild ducks and flamingoes. At the close of their day's sport, they entered a fisherman's hut in search of refreshment; but all they could obtain was a salad, cut into very small pieces, and, as is the custom in Catalonia, swimming in a profusion of liquid called *caldo*, composed of water, oil, and vinegar.

Antonio, in helping his companion to some *caldo*, used rather clumsily the roughly-fashioned wooden spoon which the fisherman had produced; for though he seemed to be lading out the *caldo*, he in reality transferred scarcely any to his companion's plate; and Venceslas insisted that he had turned the spoon the wrong way upwards, and that he was stupidly trying to take up the *caldo* with the convex side of the spoon. Antonio maintained that he was using the hollow part, and out of this trifling matter a most violent quarrel arose. And yet, as is the case with regard to many other serious quarrels, the origin thereof was not only insignificant, but groundless; for a person who accidentally came into the fisherman's hut, and to whom the matter was referred, declared, on the first glance at the object in dispute, that both sides of the spoon were alike; that is, nearly flat.

Three days after this absurd contention between Venceslas Uriarte and poor Antonio P. Dirba, the latter was found lying dead, with a rude wooden cross in his stiffened hands, near the Coll de Balaguer.

During Lent, in the year 1832, a troop of strolling players had been performing with great success at Tarragona one of those *Autos Sacramentales*, or sacred plays, which excite great interest among the Spanish people; inasmuch as they are living representations, displayed with great exactness, aided by scenic illusions, of some of the most remarkable and exciting events recorded in the sacred writings; the martyrdom of saints being frequently represented on the stage apparently in all their horrible reality. The auto sacramental which the company had enacted with so much éclat at Tarragona was, The Beheading of St John the Baptist; and in the hope of meeting with equal good fortune at Tortosa, they departed early one morning from Tarragona by the high road which passes by the Coll de Balaguer.

The baggage, wardrobe, and other theatrical equipments of the company, were laden upon several mules; but the actor, one Fernando Garcia, who performed the part of St John, preferred to carry one part of his costume himself.

Fernando Garcia was a short man, which was a main point for the effective representation of the principal character in the auto sacramental; for, in order to give an appearance of reality to the scene of the beheading of St John the Baptist, a *bonetillo*, or leathern skull-cap, was placed on the head of the actor of low stature, and upon the said skull-cap there was fixed, by means of a spring, a false head imitating nature; and the actor's dress or raiment was so arranged as to reach above, and cover his own head, leaving visible only the false one, which being struck off by the executioner on the stage, and placed apparently bleeding on a dish, or charger, produced a startling and exciting effect upon the spectators.

Now, Fernando Garcia could not make up his mind to confide this precious *cabeza*, or head, which was so essential an instrument of his theatrical success, to the care of a muleteer; for it was not merely well modelled, light in point of materials—the features being painted so as to imitate nature to perfection, with real hair parted over the forehead, and hanging gracefully over the back part of the neck—but it had glass eyes, which were constantly in motion by means of an internal spring, which was acted upon by the pressure of the said imitation-head on the skull-cap surmounting the actor's real one.

So little Fernando thought that the safer way of conveying this all-important piece of mechanism was to make himself a head taller on his journey, by ingrafting it on his own pate, as he was wont to do on the stage; and accordingly, in this guise, and mounted on a hired horse, he wended his way towards Tortosa, with the rest of the company.

Towards evening, however, he found himself alone. He had loitered on the road, and, like all loiterers, he was exposed to inconvenience. The weather was chilly, and in order to ward off its uncomfortable effects, he covered his face, and even his eyes, with his *capa*, or cloak; and trusting to the intelligence and sure-footedness of his horse, he beguiled the time by thinking of the plaudits which would be showered down upon him at Tortosa, when he should personate to the life the saint whose counterfeit head overtopped his own, without feeling any ill effects from the cold against which he had so snugly sheltered himself from top to toe. Suddenly—just at the turn of the road at the Coll de Balaguer, that fatal spot where so many mysterious murders and robberies had been committed—a shot was fired from behind one of the enormous blocks of stone already described. The actor's horse reared, and threw his double-headed and muffled-up rider, who, whilst struggling to disencumber himself from the folds of his cloak, was terrified beyond measure at seeing a man

with a carbine in his hand in the act of pouncing upon him.

Fernando, however, was not wanting in courage, and, having luckily just on that moment got free from the *capa*, he leaped upon his legs, and drawing forth a poniard, prepared for resistance.

Venceslas Uriarte—for he it was who was rushing upon his supposed victim—astounded at having for the first time missed his aim, was about to take to flight; but he lost all command over himself, and became riveted to the spot upon beholding a being with two heads; the upper one—that of St John the Baptist—rolling its eyes in the most horrible manner, whilst the menacing orbs of little Fernando Garcia were flashing on him from their sockets in his own living head underneath, and the glistening poniard was elevated, ready to be plunged into his breast.

The robber's guilty conscience raised up the most fearful imaginings; his countenance became livid, his mouth gaped widely, his parched tongue clove to the palate, and he gazed wildly on the horrible apparition. In a minute or two, however, he made another desperate effort to escape; but, although accustomed to all the rugged paths, and agile in surmounting every obstacle when pursuing his prey, or in rapid flight with his booty, such was his trepidation, that his *alpargatas*, or hempen sandals, got entangled among the briers, and threw him down several times. He tried to climb at once up to the higher part of the Coll, and for that purpose caught at a shrub which was growing out of a crevice; but the force of his desperate grasp, and the weight of his convulsed body, drew it out by the root, and he fell again at the feet of the double-headed comedian, who had hotly pursued him.

'Avaunt, Satan! Touch me not, demonio!' cried the assassin, making the sign of the cross. But his exorcisms had no effect upon the bold Fernando Garcia, or upon St John the Baptist's head; for the former stood over him with the drawn dagger, crying out stoutly at the same time for his comrades by the odd names which actors are apt to adopt, and which no doubt sounded to the prostrate robber like calls for a host of demons to carry him to the realms of eternal torment; and the latter kept rolling its eyes frightfully.

The rest of the company hastened to the relief of Fernando on hearing his cries, and found the murderer helpless from the effect of fright and a smiting conscience. He was bound and taken to the nearest town, where he was searched in presence of the proper authorities. He wore a coarse haircloth shirt; and there were found upon him a rosary, a little book of prayers, and a sort of locket, containing—according to a memorandum on the piece of parchment in which it was wrapped—some of the hair of St Dominic. But he carried also concealed a poniard of highly-tempered steel; and in a pouch were four bullets, each wrapped in a small piece of greased linen, and fitting his carbine. There were also a few charges of fine gunpowder in a flat powder-horn.

This hypocritical and cruel malefactor was reduced to a state of abject cowardice by what he considered to have been a supernatural interposition, and confessed that he was the assassin of El Coll de Balaguer.

'But,' said the magistrate, 'how could you dare to place the cross in the hands of your victims?'

'It is no great matter,' replied the reckless murderer, 'to kill the body; but to destroy the soul is an abominable crime! I adorned their tombs with flowers, and I prayed fervently that they might be spared some days of purgatory. I placed in their hands, immediately after their death, crosses upon which I had previously procured a blessing, in order that, if they were not in a state of grace, they might at all events repulse the devil! But there he is! I see him! I see him now!' he cried, on perceiving little Fernando Garcia advancing with his two heads, in order to show the magistrate how it was that his life had been saved.

'There he is! Avaunt, Satanas! avaunt!' muttered

the wretched assassin, and fell into a swoon, after some violent contortions.

He was tried by the proper tribunal, sentenced to death, and executed; and the brave little comedian had reason to rejoice for the remainder of his days at the practical proof which had been exhibited in his own person of the truth of the old saying, that two heads are better than one.

It is almost needless to add, that the auto sacramental was witnessed at Tortosa, and other places, with increased interest by the thousands who flocked to the theatre when it was represented, in consequence of the important part the head had performed in the drama at the Coll de Balaguer, and in bringing to justice the notorious Venceslas Uriarte.

BIOGRAPHIC SKETCHES.

M. GUIZOT.

M. Guizot, the present prime minister of France, seems to us, in more than one respect, a singular and interesting personage. Previously to the revolution of July, his literary productions had acquired him a European fame; and these now entitle him, in the opinion of competent judges, to be considered the founder of that new historical school to which we owe the brilliant writings of Michelet and Thierry. With the memorable convulsion of 1830, he leaped at one bound into high official rank; and he is now beyond all dispute acknowledged to be the leading statesman of France. This double success in literature and in life, so rare, though not unexampled in our time, was of itself sufficient to command attention and excite curiosity. But our surprise at Guizot's political triumphs is heightened when we reflect on the circumstances under which they have been achieved. He has reached and maintained himself on his present elevation, although a man of obscure birth and no fortune; nor can he be said to have displayed, or to possess, the peculiar qualities with which, in stormy times, those who have forced their way into power have, for the most part, been gifted. Guizot's chief characteristics are a clear logical understanding, and a certain cold philosophical composure: he has nothing about him of the Chatham or the Mirabeau.

For these reasons, a minute narrative of Guizot's personal and political career could not fail, we think, in the hands of a well-informed writer, to prove in a high degree pleasing and instructive. Such a task we have no intention of attempting; the materials, were it nothing else, are, and may for long be wanting: meanwhile, however, some few and scanty facts which, in the field of French contemporary biography, we have been able to glean respecting this remarkable man, may perhaps be acceptable to a large class of our readers.

Francis Peter William Guizot was born at Nîmes, a town in the department of Gard, and province of Languedoc, on the 4th of October 1787. His family had long been settled in the south of France as respectable citizens of the middle rank, and in communion with the reformed church, of which Guizot himself is, and has always been a member. His father was an advocate of Nîmes, a man of talent and eminence in his profession, and, as the anecdote we are about to quote will show, of humane and heroic temper. Like his brother Protestants, he had welcomed with joy the revolution of 1789, which relieved the French dissenters from all restrictions on the public exercise of their religion. After the execution of the king, however, his zeal, with that of so many others, began to cool. When the Reign of Terror was nearly at its height, he saw himself one of the 'suspected,' and was forced to conceal himself, to avoid imprisonment and death. 'He was found,' says a trustworthy biographer of his son, 'in his hiding-place by a gendarme; but this person regretting to have discovered him, and unwilling to have any share in his destruction, offered to let him escape. M. Guizot perceived that, to save his own life, he must compromise that of his merciful captor, and did not hesitate for an instant before

relinquishing his only chance of preservation.' He was guillotined at Nismes on the 8th of April 1794, a few days after the execution at Paris of Danton and Camille Desmoulins. The young Guizot was then seven years of age. The sad spectacle of his father's death, as may be well supposed, produced a deep impression on his mind. We learn that it has never forsaken him; and perhaps it may in part account for that hatred of anything like revolutionary anarchy which he has manifested through life.

Immediately after this fatal event, Madame Guizot removed with her two sons to Geneva, where her own relatives resided. She has been described as an excellent woman of the old school; religious, true-hearted, and energetic; bound up in the welfare and right education of her children. She was one day, we have somewhere read, found by a visitor with Guizot on her knee, to whom she was repeating stories from the lives of the great reformers. 'I am trying,' she said, 'to make my Frank a resolute and diligent boy.' At the age of twelve, Guizot was sent to the public school of Geneva; and here he proved that his mother's efforts had not been thrown away. Indeed so absorbing was the vigour with which he applied himself to whatever he had in hand, that he became the butt of his more mercurial companions, who delighted in teasing with all sorts of practical jokes the abstracted little student. Aided by perseverance, his talents produced, in four years only, results that seem almost incredible: at sixteen, we are told Guizot could read and enjoy, in the originals, 'Thucydides and Demosthenes, Cicero and Tacitus, Dante and Alfieri, Schiller and Goethe, Gibbon and Shakspeare.' The two succeeding years were devoted to metaphysical studies, from which his mind, so eminently reflective, drew nourishment even more appropriate than that which it had found in the masterpieces of poetry and history. Finally, when he had gained the highest academical honours, it was thought by his mother and her friends that he could not but succeed in his father's profession. For a young man, too, of his gifts and accomplishments, they decided Paris was the only fitting sphere. Accordingly, towards the end of 1804, Madame Guizot returned once more to Nismes, whence, after a brief stay, Guizot himself proceeded, full of hope and ambition, to study law and push his fortunes in the French metropolis.

It was in 1805, the year after Napoleon's elevation to the imperial throne, that Guizot arrived in Paris. 'Poor and proud, austere and ambitious,' he saw himself in the midst of a brilliant, frivolous, and intriguing society, unfurnished, by his strict Genevese education, with the means of shining in such a world, and disinclined by nature to make the attempt. The Revolution, moreover, had destroyed, with so much else, the Paris law school, and Guizot was left, without a teacher, or any aid but that of books, to sound as he best might the mysterious depths of jurisprudence. The first twelvemonth of his stay in Paris was spent in solitary study; happily, during the next, he made the acquaintance of a M. Stopfer, the former representative of the Swiss republics, and, with the connexion which sprang out of it, Guizot seems to have abandoned all thoughts of law as a profession. This gentleman was a person of worth and learning, deeply versed in German metaphysics, a subject on which he had more than once appeared before the world as an author. Beneath his roof, as preceptor to his children, Guizot resided during the years 1807-8. In Stopfer he found not only an employer, but a paternal friend: under his guidance he was enabled to master the philosophy of Kant, and he had leisure enough still remaining to recommence the study, and perfect his knowledge of the classical authors. Besides this, he procured him admission to the society he most coveted—that of literary men. Among those of this class to whom he introduced him, one was M. Suard: at his house Guizot became a constant and grateful visitor: here, on a footing of perfect equality, he met the most distinguished members both of the old school and the

new one, already beginning to displace it. In Suard's saloon might be seen in friendly converse Chateaubriand and the Abbé Moullet, Madame de Fontane and the Chevalier de Boufflers.

Guizot, though at this time a silent and reserved young man, made such use of these opportunities, that when, in 1809, he ceased to reside with M. Stopfer, he could with safety—so far at least as regarded the certainty of employment—enter on the perilous career of the author by profession, who trusts to his pen alone for his support. He became a contributor to a number of the graver periodicals of the day. His first book appeared in 1809 itself; it was a 'Dictionary of French Synonymes,' and in part a compilation; but he prefixed to it an original treatise on the philosophical character of the French language, 'that displayed already,' says a critic, 'that genius for precision and method which to-day distinguishes M. Guizot.' This was followed in 1811 by a translation of Rehfus' work on Spain, and by an essay on the state of the fine arts in France, and the Paris art-exhibition of 1810. The same year he was appointed conductor of the 'Annals of Education,' a valuable periodical, which continued till 1815 to appear under his editorship. Guizot was beginning to rise in public estimation. Literature, indeed, could not then be said, even with less justice than at present, to be a source of wealth to its cultivators; but it brought him enough for his simple wants. Powerful friends were promising him their aid for the future; so prudence itself, he thought, no longer forbade him to complete his union with the gifted lady (first seen by him in the literary circle assembled at Suard's) to whom for several years he had been attached and engaged. The way in which their intimacy originated is probably known to but few of our readers: it is one of those romances of real life more surprising than any fiction. In this case the romance is not the less interesting to us from its being one of real literary life.

Pauline de Meulan was born in Paris in the year 1773, fourteen years earlier than her future husband. Her father, after having enjoyed for the greater part of his life the possession of a considerable fortune, saw it swept away by the Revolution, and dying in 1790, the year after its loss, left a widow and large family almost wholly unprovided for. Some time after Mademoiselle de Meulan had reached womanhood, it flitted one day across her mind that she too might perhaps possess some literary talent, and in this way contribute to the support of those she loved. The thought was immediately put into action: she began a novel, and, chaining herself to her desk for several weeks, at last saw it duly completed. Some old friends of her father found her a publisher. The book was successful; and, thus enlisted in the corps of authors, she became one of its most industrious members. A year or two afterwards, M. Suard established a journal called the *Publicist*. Mademoiselle de Meulan, now a practised writer, was appointed contributor-in-chief, and her light graceful female pen soon made the work exceedingly popular. At last, in the first months of 1807, she was seized with a dangerous illness, brought on or hastened by over-exertion. The malady was of such a kind that she could not continue her labours; yet for years the produce of her essays in the *Publicist* had been the sole resource of her mother and herself. In this painful situation she received one day by post an article written in happy imitation of her style and manner: it was accompanied by an anonymous letter, in which she was requested to set her mind at rest, as, until her health should be restored, a similar article would be forwarded to her for each future number of the *Publicist*. The offer was tacitly accepted, and the articles came with the utmost regularity. On her recovery, she mentioned the circumstance in M. Suard's saloon, little thinking that the pale taciturn young philosopher, who was listening calmly to her story, held the key of the mystery. Unable to discover her benefactor, she at last, in the *Publicist* itself, requested him to disclose his name.

Guizot now acknowledged himself to be the unknown friend, and five years afterwards Mademoiselle de Meulan became his wife. They were married in the April of 1812; and though the lady was, as we have seen, fourteen years older than her husband, their union was the happiest possible. Madame Guizot is said, from the purity and severity of her moral nature, to have exerted a powerful influence on her husband's spiritual culture. In a humbler way than this too she was of great assistance to him. Thus, the translation of Gibbon,* which, during the first year of their marriage, appeared under his auspices, and with his valuable notes, was revised and corrected by her; and she relieved him likewise in great part from the labour of editing the 'Annals of Education.'

The year 1812 was altogether a remarkable one in Guizot's hitherto tranquil career. In the course of it, his friends Baron Pasquier and M. de Fontanes attempted to introduce him to political life by soliciting for him the post of auditor to the imperial council of state. Muret, Duke of Bassans, to whom the application was made, directed him to draw up a state-paper as a specimen of his ability. The subject was to be an exchange, then talked of by Napoleon, between Great Britain and France of their respective prisoners of war. But the emperor, it was well known, was insincere in making the proposal, as he deemed the support of the French prisoners a burden to Great Britain, while he himself was, at the time, in no want of soldiers. A suspicion of this insincerity was too prominent in Guizot's performance: he did not seem a fit man for ministerial purposes, and the application remained without effect. M. de Fontanes procured him, however, the professorship of modern history in the Paris Faculty of Letters, afterwards the scene of some of his noblest triumphs. This situation brought him into contact with his colleague Royer-Collard, the well-known professor of philosophy, to whom Guizot in every way owes much. They formed a friendship which promised to be lasting, and indeed it did last for a long period. Unhappily, after the revolution of July, it was dissolved by political differences.

In 1813 he was occupied with the duties of his chair: he published also his 'Lives of the French Poets during the age of Louis XIV.,' a first volume only, which has had no successor. In 1814, after so protracted a separation, he paid a visit to his mother at Nismes, and while there, the first restoration of the Bourbons occurred, an event with which Guizot's entry into public life begins. On returning to Paris, he was recommended by his friend Royer-Collard to the minister of the interior, the Abbé de Montesquiou, who appointed him his chief secretary, a subordinate, but, in Guizot's hands, an influential post. Along with Royer-Collard, he framed the severe law against the press, which was presented by M. de Montesquiou to the Chamber of 1814, and he was made one of the royal censors. When Napoleon came back from Elba, Guizot did not resign his situation; but he was, however, dismissed by Carnot, the new minister of the interior. This was in May 1815. A few days afterwards, when it was perceived that the great European powers would not treat with Napoleon, whose fall, sooner or later, was therefore inevitable, Guizot was despatched by the constitutional royalists to Ghent, where Louis XVIII. then resided, to plead with that monarch the cause of the charter, and point out the necessity of removing from his council M. de Blacas, the leader of the stiff-necked unyielding royalists of the old régime. His expedition was a successful one. On his return to France, after the battle of Waterloo, Louis XVIII. dismissed M. de Blacas, and promised, in the proclamation of Cambrai, a more faithful adherence to the charter. This is the

origin of the epithet, 'Man of Ghent,' applied to Guizot by his political opponents, and with which every reader of newspapers is familiar.

During the first five years of the second restoration, Guizot filled, with little intermission, various semi-official posts of respectability indeed, but of slender importance. Such influence as he possessed (and though not a deputy, it was considerable), he exerted to liberalise the successive ministries under which he served. It was during this period that the small knot of thoughtful politicians of which Royer-Collard, Camille Jordan, and Guizot were the heads, received the nickname of 'Doctrinaires.' The meaning of the word 'doctrinaire,' in its present extensive application, it would be difficult or impossible to explain; but its origin, as a party designation, may be stated for the benefit of those of our readers who have heard the term used without being able to attach to it any idea. The 'doctrinaires' were, before the revolution of '89, a French Catholic community, which had various colleges for the instruction of young persons. Royer-Collard had been educated in one of these. This philosopher's speeches in the Chamber of Deputies were for the most part of an abstract and rather pedantic kind, teeming with phrases more suited to the schools than to that political arena. One of his favourite expressions was 'doctrine,' and as this word dropped from him one day, an ultra-royalist wag seized the opportunity to exclaim, 'Ah! there go the doctrinaires.'

In the February of 1820, the assassination of the Duke de Berri produced an anti-liberal reaction. The Decazes ministry was forced to resign, and with its fall Guizot lost the situation which had been created for him in the preceding year, of 'Director of the Municipal Administrations of France.' He now resumed the duties of his chair, which had meanwhile, we suppose, been performed by deputy, and endeavoured to make up for the loss of his official income by renewed and strenuous literary labour. 'After the fall of M. Decazes,' says a writer in the *Revue des Deux Mondes*, 'the interior of M. Guizot's house long presented a curious spectacle. His brother-in-law, M. Devaines, prefect of the Nièvre, had been, like himself, deprived of his situation, and he returned to Paris with his wife and two nieces, one of whom M. Guizot afterwards married. On one side you saw Madame Guizot and her nieces slitting up, re-making, and annotating Le Tourneur's translation of Shakspeare; on the other, M. Guizot was busied with his researches into the history of France; further on, a few young men, docile pupils of the master, were ferreting, with the aid of a lexicon, in the barbarous Latin of Oedericus Vitalis; others were translating the Memoirs of Clarendon or the Eikon-Basilike of Charles I., laboriously erecting, stone by stone, that great edifice, the Collection of Memoirs relating to the English Revolution, which bears on its front the signature of M. Guizot.' An interesting peep into a literary workshop.

The fruits of this industry were speedily given to the world. In 1821 appeared a new edition of Rollin and Le Tourneur's now amended and annotated translation of Shakspeare; in both of which enterprises, though Guizot bore away the honour, his wife had the principal share. The researches mentioned in the passage just quoted, were for his lectures on the history of representative government in France, delivered during the winter of 1821-2. In 1822, an event took place which made him more dependent than ever on his literary exertions. He had found time, in the course of 1821, for the composition of a long political pamphlet, in which his favourite doctrine of liberty, in alliance with order, was powerfully and elaborately developed. The new ministry disliked his love of freedom, although it was united with a respect for established institutions. They feared, above all, his influence as a teacher on the rising generation, and accordingly suspended him from the functions of his professorship.

For several years after this occurrence Guizot remained a stranger to politics. His sensible and far-seeing turn of mind kept him from lending his aid to any of

* By the way, few persons (even though professed bibliographers) are aware that a considerable portion of this translation was executed by Louis XVI. when dauphin. It was completed 'by various hands'; and being the French version of Gibbon in general use, has had a number of editors, from Monsieur (or rather Madame) Guizot downwards.

the thousand-and-one (sometimes very extensive) conspiracies which, while the Villele ministry remained in power, every day brought forth, though only to be crushed. He calmly waited till the time should come when he might with safety, and some prospect of success, take a part in public affairs. Meanwhile, historical studies, and the preparation of historical works, kept him constantly employed. In 1823 appeared his *Essays on the History of France*, and the first volumes of two grand collections of memoirs, one relating to the great English revolution, the other to the early history of France: these, as they were published serially, demanded his almost undivided attention for a considerable period. Yet his industry did not altogether hinder him from enjoying social life; and though he was poor, his visitors were not solely—strange as it may seem to an Englishman—from the ranks of the indigent and obscure. It is of the Guizot of that period that a writer in *Fraser's Magazine* thus speaks:—'Small were his apartments—far, far too small to admit the crowds of literati who sought to claim the honour of his acquaintance, or who, having made, were not willing to lose it. On his reception-nights, the small street at the back of the Madeleine in which he resided was crowded with carriages, as well as all the contiguous streets; and his visitors moved more quickly from one little room to another than they otherwise would have done, because they felt that they owed this act of courtesy to those who came pressing after them. If it had been the drawing-room of a young and beautiful queen, or the levee of a popular and distinguished cabinet minister, no anxiety to be admitted, to speak, to exchange looks, could have been more closely and strongly marked than on these occasions. Madame Guizot, and one or two female friends—often the late Duchesse de Broglie, the Lady Peel of France—presided at a tea-table, where the simplest fare was distributed by pretty taper fingers, which even vied with bright eyes and enchanting smiles. Yet were those entertainments sumptuous with wit, with poetry, with philosophy, and with the best life of good society and of the élite of Paris. But death here also has intruded too frequently to permit me to think upon those once happy reunions; and the dear little house in the Rue de l'Evesque has witnessed tears and sobs, and agonies of grief, which none can portray, and which even few can feel.' This allusion is to Guizot's loss of the beloved companion both of his toils and his enjoyments, not long before that of their only child. Madame Guizot had been unwell during a considerable portion of 1826. With the new year, it was evident that she was slowly sinking. On the 30th July 1827, she perceived that her end was at hand: she summoned her son and her friends to her side, and bade them farewell—the former was soon to follow her to the tomb. On the morning of the next day she asked her husband to read to her; he took down a volume of Bossuet, and began the funeral oration of Henrietta Maria of England; when he had finished, he looked towards her, and saw that she was no more. We must now hurry on.

The year which was marked by this domestic calamity was also that of Guizot's return to politics. Perhaps his chief motive for this is to be found in the fact, that he was now forty years of age, and therefore qualified to enter the Chamber of Deputies. In 1828 he established the *Revue Française*, as an organ for the expression of his opinions, and he became an active member of the *Aide-toi** Society, then just formed, the objects and procedure of which were quite in accordance with his views. It was founded to protect the electoral system from the assaults of the Villele ministry. Nothing could be less revolutionary than the mode in which it sought its end, by appealing, namely, but with the cumulative force which is the great result of association, whenever the law was infringed, to the authorised legal tribunals.

* In full—*Aide-toi, le ciel t'aidera*—'Help thyself, and Heaven will help thee.'

In the January of 1828, the liberal ministry of M. de Martignac displaced that of Villele, and one of its first acts was to restore Guizot his chair. It was now, amid the enthusiastic plaudits of a brilliant audience, that he began his well-known lectures on the History of Modern Civilisation in Europe. With the August of 1829, the Polignac ministry came into office; its subsequent history is familiar to our readers. Guizot threw himself energetically into opposition, attacking with his vigorous pen, in the columns of the *Temps*, and the *Journal des Débats*, the policy of that too famous administration. Chosen deputy by the electoral college of Lisieux in the January of 1830, he was among the protesting 221. He returned from Nîmes to Paris on the 26th of July, to learn the publication of those ordinances which cost Charles X. a throne. On the 27th, at the meeting of deputies held at Casimir Périer's house, the protest drawn up by Guizot was the one agreed on to be signed. He was the author also of the address in which, on the 28th, the Duke of Orleans was invited to undertake the office of lieutenant-general of the kingdom. On the last of the Three Days, it was Guizot that proposed the appointment of a commission to secure the maintenance of order. On the 30th, he was named by its provisional minister of public instruction; and at the accession of Louis-Philippe, he accepted the most important and difficult post of all, that of minister of the interior.

Guizot's career since the revolution of 1830 belongs not to biography but to history. Yet we must not conclude without at least alluding to the benefits which, as minister of public instruction, he has conferred on his country. Perhaps we cannot better close this slight sketch than by quoting, from his circular to the instructors of youth then under his jurisdiction, the following noble passage:—'There is no fortune to be made, scarcely any reputation, in the round of those laborious duties which the teacher performs. Destined to behold his life glide on in monotonous toil, sometimes to meet with, in those around him, the injustice or the ingratitude of ignorance, he would often mourn, and perhaps despair, if his strength and courage were brought from no other source than the calculation of his immediate and purely selfish interest. A deep feeling of the moral importance of his labours must sustain and inspire him. In the austere pleasure of serving men, and contributing in secret to the public weal, let him find his worthiest recompense, one which only his conscience gives him. His glory is to aspire to nothing beyond the sphere of his obscure and laborious avocations; to exhaust himself in sacrifices little heeded by those who profit by them; in fine, to toil for men, and look for his reward to Heaven alone.'

WEST INDIA MAIL.

HAVING, in a late number of the Journal, given an account of the East India mail, we now proceed to detail a few particulars respecting the mail to and from the West Indies, which, it is hoped, will prove interesting to all, and possibly new to many, of our readers.

The mails for these important colonial possessions and foreign places are made up in London on the 2d and 17th of every month. Letters posted in London up till eight o'clock on either of these mornings are in time for the packet. The mails are conveyed by the South-Western Railway to Southampton, where they arrive about mid-day, and are transferred, without delay, by means of a small steamer, to one of the splendid steam ships belonging to the Royal Mail Steam-Packet Company; which transatlantic steamer, having her steam up, and all in readiness, at once proceeds on her voyage.

A gigantic undertaking is this line of West India steam-packets. There are eighteen vessels, the largest of which are about 3000 tons burthen, gross measurement. Fitted up in the most handsome and comfortable manner, a West India mail-packet is capable of carrying about 100 passengers, to each of whom a separate

sleeping berth is allowed. What a contrast to the old pent-up sailing packets! Besides the amount of passenger-money now being less, and the time occupied only about one half, the great comfort and ease with which a passenger can 'stretch his legs' on board the steamers, can only be truly felt by an old *voyageur* in one of the late sailing craft.

Each out-steamer, after leaving Southampton, proceeds to Funchal in Madeira. The run to this place, 1287 miles, occupies seven days. Mails and passengers are landed here in a few hours; and fresh meat, eggs, and fruit having been obtained, the steamer directs her course across the Atlantic.

The island of Madeira has lately become a great resort of invalids from England; and no wonder, seeing what different residents at that place state as to the nature of the climate. One writer in the Monthly Repository of 1834 says, 'People ought to be happy here.' The author of Six Months in the West Indies observes, 'I should think the situation of Madeira the most enviable in the world. It insures almost every European comfort, with almost every tropical luxury. Any degree of temperature may be enjoyed. The seasons are the youth, maturity, and old age of a never-ending, still-beginning spring.' Sir James Clark, in his valuable work on the Sanative Influence of Climate, writes as follows:—'Madeira has been long held in high estimation for the mildness and equability of its climate; and we shall find, on comparing this with the climate of the most favoured situations on the continent of Europe, that the character is well founded.' Dr Heinekin says, 'Could I enjoy, for a few years, a perpetual Madeira summer, I should confidently anticipate the most beneficial results.'

The Guide to the West Indies, &c. thus contrasts the approach of the steamer to Barbadoes with that of the intrepid Columbus:—'Onward ploughs the giant ship. What to her are the winds? She heeds them not! The waves? They are but her highway! Onward she goes; untiring, unresting, with steady purpose. What to us in this noble ship were the fears, the superstitions, the terrors of those who accompanied that man who first sought, through these waters, the new world?—who, with firm faith, on that eventful 3d of August 1492, pushed off his three small ships—one only of which was completely decked—to seek that new world which had for years existed in his thought, and flourished in his imagination. We are not to be terrified by fancied shrieks in the wind, or of hostile armies imaged in the clouds. The change in the direction of the compass does not fill us with dread; nor do we suppose that the masses of sea-weed that may encircle us are sent by spirits of evil to bar our approach! To us these things are as idle dreams; but they were strong and fearful realities to those lone men in their little vessels who first entered those seas. They were realities to all but him whose firmness, decision, and indomitable will led them on, in firm trust in that God whose religion he sought to establish in a world unknown. What must have been his thoughts and feelings when, after many years of contest and delay, he stood among his superstitious crew, in the middle of night, on his vessel's deck, and for the first time saw a moving light on shore:

Pedro, Rodrigo! there methought it shone!
There, in the west; and now, alas! 'tis gone.
'Twas all a dream—we gaze and gaze in vain!
But mark, and speak not—there it comes again!
It moves! What form unseen, what being there,
With torch-like lustre, fires the murky air?
His instincts, passions, say, how like our own;
Oh! when will day reveal a world unknown?—*Rogers.*

The island of Barbadoes* is the first place in the West Indies where the steamers call. The voyage from Madeira occupies fourteen days. Having stopped one

day for home-mails, the steamer proceeds to Grenada, which she reaches in about fifteen hours. The total distance from Southampton to Grenada, called route No. 1, is 4037 nautical miles, and is performed in twenty-three days, including the stoppages.

Grenada is the principal place where the mail-packets meet to exchange the different mails, replenish coal, water, and other stores, and refit after long voyages. These objects being all accomplished, and all in readiness, before the packet arrives from England a delay of not more than twelve hours occurs in the transfer to the respective branch packets.* All the mail-steamers described in the subjoined note work in together, keeping up one grand combination, according to all places mentioned opportunities, some twice, others once a month, of receiving letters both from Europe and interinsularly, of transmitting replies thereto, and of transit to travellers going in any direction. Now we can calculate almost to an hour when advices will reach us—a circumstance of the highest importance to the commercial world: *regularity*, rather than fits and starts of celerity, being the great desideratum.

Letters can be despatched on the 2d and 17th from London for Barbadoes, Grenada, St Thomas, and Bermuda, and answers will be received back in fifty days; (despatched 17th) New Grenada and Guatemala, in

* The dispersion takes place in the following order:—On route 2, a packet starts fortnightly from Barbadoes, with out-mails for Tobago and Demerara, where she stops a week; then returns with home-mails to Tobago, Grenada (where the home-mails are deposited), and Barbadoes.

On route 3, one starts fortnightly from Grenada with the out-mails for Trinidad, where she remains nine days; then returns with home-mails to Grenada.

On route 4, one starts fortnightly from Grenada with the out-mails for St Vincent, St Lucia, Martinique (French), Dominica, Guadeloupe (French), Antigua, Montserrat, Nevis, St Kitt's, Tortola, St Thomas (Danish), and Puerto Rico (Spanish). At this latter place the stoppage of the steamer is only a few hours, after which she returns to St Thomas to coal; afterwards calling at each island already mentioned, on her way back to Grenada.

On route 5, one starts fortnightly from Grenada with the out-mails for Jacmel (Haytien), Jamaica, and St Jago de Cuba (Spanish). Here she stops two days, when she returns to Jamaica to coal; and after having allowed this island eight days from the first arrival there, for receiving replies from the interior, she returns to Jacmel; thence proceeds to Puerto Rico and St Thomas.

On route 6, one starts monthly from Jamaica with the out-mails for Havannah (Spanish), where she coals, Vera Cruz, and Tampico (both Mexican); at this place she remains from five to ten days, according as shipments can be effected, which are often almost impracticable, the bar at the entrance, outside of which the steamer anchors, being often impassable, especially when one of the violent and dreaded 'northern' sets in. At this place, and also Vera Cruz, very large shipments of specie take place, there being sometimes as much exceeding two and a half million dollars sent on board—coming from the mines in the interior for England—at one time. After waiting off Tampico long enough, the packet returns to Vera Cruz and Havannah. Here she re-coals, then proceeds to Nassau and Bermuda, where she coals up for the Atlantic voyage; then proceeds direct to Southampton, arriving there on the 7th of each month.

On route 7, one starts monthly from St Thomas with the out, as well as home-mails, for Bermuda. Here she lands the out-mails, and delivers the home-mails to the last-mentioned ship, going (as in route 5) to England; then coals, and proceeds to Nassau, Havannah, and Jamaica.

On route 8, one starts monthly from St Thomas with all the collected home-mails, proceeding via Fayal to Southampton, arriving there on the 23d of each month.

On route 9, one starts monthly from Grenada with the out-mails for La Guayra and Puerto Cabello, stops there two days, and returns to La Guayra; then to St Thomas and Grenada.

On route 10, one starts monthly from Jamaica with the out-mails for Santa Martha, Carthagena, Chagres, and San Juan de Nicaragua, in the newly-acquired British territory on the Mosquito shore. This latter has been taken possession of by our government, to secure to this country a means of crossing to the Pacific, by way of the San Juan river, independent of any adverse state. Although done without notice, this is nevertheless a most important step to this country; one which shows that our rulers have their eyes open to the future political as well as commercial benefits that will result from the possession of this key to the Pacific! But to return to No. 10 steamer: she proceeds, after a day's stop at San Juan, to Jamaica with mails for England, calling at each place already mentioned on the backward route.

On route 11, one starts monthly with out-mails from Havannah for Belize in Honduras; stops a few days; thence returns to Havannah.

* At those places marked in Italics, the packets meet to exchange outward, homeward, and inter-colonial mails.

eighty days; (despatched 2d) Mexico and Honduras, in ninety-five days; (despatched 2d and 17th) all other places in sixty-five days.

The fare to Madeira is L.22, or L.30; to Barbadoes L.32, or L.42; to Jamaica L.40, or L.50; and to other places in proportion to the distance. These certainly are very moderate rates for travelling such long distances. To Mexico, the country farthest away, an expanse of sea exceeding 7000 miles has to be traversed. It appears, however, that for upwards of the three years these steam-ships have been constantly at sea (during which time 154 voyages have been performed out and home, only a few of which occupied more than the time now allowed), many of them have run over a space of 115,000 miles respectively—more than four times round the world—yet in no instance has the least mishap to a single pin of their gigantic machinery occurred. This certainly goes to prove the superior construction of the ships and engines, and correctness of the officers in command. The very *Atlantic* may now be said to be *tamed*, as by a railway!

THE GREEK STAGE.

THE novel and successful attempt which has been recently made in London to excite sympathy amongst an English audience for one of the lofty tragedies of Greece, may perhaps render acceptable a short sketch of the stage performances of the ancients. The same play has met with a gratifying reception in the capitals of France and Prussia; and it is stated that, under royal command, another Greek drama is shortly to be performed. Wonderful is it that plays produced considerably more than two thousand years ago, should, in spite of time, retain a power to delight in an eminent degree people of other lands and other languages. But our wonder will abate if we consider for a moment that it is one of the main attributes of genius to be ever fresh and inviting. We cannot glance round our libraries without perceiving that genius had contracted divine aspirations after the future, and, looking earnestly forwards, had written as much for posterity as for the present. Hitherto, the Greek plays have been conned as tasks in duaky studies, or enjoyed by the learned few; but it has now been shown that they contain matter fitted to delight the minds of the many. It may now be seen that Greek keeps concealed in its crabbed characters a peculiar manifestation of interest which we may look for in vain elsewhere, and even when adequately expressed through the medium of a translation. What has our own Milton said in praise of the Greek tragic writers?

* Thence what the lofty grave tragedians taught
In Chorus and Lambic, teachers best
Of moral prudence, with delight received,
In brief sententious precepts, while they treat
Of Fate and Chance and change in human life;
High actions and high passions best describing.*

But this was not all that Milton was pleased to say upon this topic. 'Tragedy' (we transcribe from the poem to Samson Agonistes, a drama written after the old models)—'Tragedy, as it was anciently composed, hath been ever held the gravest, moralest, and most profitable of all other poems; therefore said by Aristotle to be of power, by raising pity and fear, or terror, to purge the mind of these and such-like passions; that is, to temper and reduce them to just measure, with a kind of delight, stirred up by reading or seeing these passions well imitated. Hence philosophers and other gravest writers, as Cicero, Plutarch, and others, frequently cite out of tragic poets, both to adorn and illustrate their discourse. This is mentioned to vindicate tragedy from the small esteem, or rather infamy, which, in the account of many, it undergoes at this day, with other common interludes.'

They who assign to the drama no higher part in Grecian life than it plays in ours, are most grievously at fault.

Inasmuch as amongst the Greeks the drama held a conspicuous position in their *religious* economy, it excited a far more serious attention in its performance, and a far deeper interest in its production, than can possibly arise in a land where the religion neither admits nor requires such assistance. Its effects were more deeply improved, and were more extensively diffused amongst the masses, as well by reason of their religious character, as that the theatre was almost the only place in which the people could obtain an audience of the intellectually great. A natural consequence was, that the government felt called upon not only to contribute large sums to the support of the theatre, but to interfere very frequently (and often injudiciously) in its actual management. Thus the price of admission at Athens was for a long time one drachma, a silver coin weighing about nine grains; but by the influence of Pericles, a decree was passed reducing the fee to a third, namely, two oboli; which sum, if beyond the means of any citizen, he could obtain from the magistrates. The perpetuity of this law was secured by an enactment which imposed the penalty of death upon those who unsuccessfully attempted to repeal it. The public treasures were thus foolishly squandered; and even the eloquence of Demosthenes was unable to convince the Athenians of the sin of this law. The legislature also took upon itself to regulate the number of the chorus in each drama. The services of a chorus were so frequently required in the solemnities at Athens, that each tribe was compelled to provide a choregus—an officer who, amongst the poorer tribes, was maintained by the state. His duties were to supply a band of vocal and instrumental performers, to provide them with embroidered clothing for festivals, and to appoint a chorus master. Upon holidays, he appeared at the head of his band wearing a gilt crown and rich robe. The watchful eye with which everything appertaining to the stage was regarded, may be gathered from an incident mentioned by Herodotus. The capture of Miletus by the Persians, an affair dishonourable alike to the arms and councils of Athens, was made the subject of a tragedy by Phrynichus; and such was the power with which it was treated, that the audience were moved to tears. The poet was mulcted in a thousand drachmas for dramatising this calamitous occurrence, and the repetition of the piece was forbidden. Another anecdote, related on good authority, shows the fascination which theatrical amusements exercised over the Athenian mind. During the representation of a tragi-comedy, written by Hegemon near the close of the Peloponnesian war, the news of the total defeat of their fleet and army before Syracuse was communicated to the spectators. Almost every person in the house had lost a relation, and the performance was stopped by a burst of grief which the disastrous intelligence inevitably called forth. Nevertheless, as soon as the first paroxysm of sorrow was quelled, the audience reseated themselves, and covering their faces with their mantles, the play was ordered to proceed to its conclusion.

The theatres of the Greeks were not intended, as ours are, for performances during several consecutive months, but were open only for a short time at the seasons appointed for religious festivals, when the capitals were crowded with a population gathered from a wide circuit. The word 'theatre' is associated in our minds with night, and gas-light, and heated houses; but the acting of a play in Greece took place under very different circumstances. The performance was invariably by day, and their theatres had no roof, so that the spectators sat beneath the open sky. It was thought improper for women to appear on the stage, and female characters were therefore personated by men, as they were in England in the time of our early dramatists. A great concourse of people was the natural consequence of the particular period, and of the shortness of the time during which the theatres were open, and thus it was necessary to build them on a vast scale. Some were large enough to hold fifteen or sixteen thousand people. In this fact we may discover some justification for certain peculiarities of costume that would not be tolerated amongst ourselves, because they would remove one source of pleasure with which theatrical amusements are

witnessed. The actors were raised above the ordinary height by means of the *cothurnus*, or buskin, and their faces were concealed by carved and painted masks. From the great size of the building, the spectators were too far removed from the stage to enable them to read on the actor's countenance that language of feeling and passion which speaks so powerfully, even when the tongue is silent. 'And how did Garrick speak the soliloquy last night?' 'O, against all rule, my lord; most ungrammatically! Betwixt the substantive and the adjective, which should agree together in number, case, and gender, he made a breach thus—stopping as if the point wanted settling; and between the nominative case, which your lordship knows should govern the verb, he suspended his voice in the epilogue a dozen times, three seconds, and three fifths, by a stop-watch each time.' 'Admirable grammarian! But, in suspending his voice, was the sense suspended likewise! Did no expression of attitude or countenance fill up the chasm? Was the eye silent? Did you narrowly look?' 'I looked only at the stop-watch, my lord.' 'Excellent observer!' The critic's conduct, at which Sterne rightly dealt his sarcasm, would not have been so egregiously out of place in a Greek theatre. The masks were so fashioned as to indicate with more or less distinctness the person represented; and if they concealed the workings of emotion, the contrasting differences and nice transitions of expression, they helped to idealise the actor, and so far carried out the Greek notion of tragedy. In some lines addressed to an accomplished actress, Charles Lamb felicitously says,

'Your smiles are winds, whose ways we cannot trace,
That vanish and return we know not how.'

This is merely one example; but even the reader who never entered a theatre may conceive that the occasions are innumerable in which an actor, by his countenance, can add a most expressive commentary to his words, and at another time can hint a thousand words when he does not utter one. Yet all this kind of acting, and the pleasure derived from its successful accomplishment, the Greeks deliberately denied themselves by the use of masks. At the same time, it should not be forgotten that they were contrived with a view to increase the power of the voice, and that they were embellished to a high degree by the united efforts of the first sculptors and painters.

A Greek theatre was of a semicircular or horse-shoe shape. Tiers of seats for the audience were placed round that part of the interior which was curved, whilst the stage was formed by a platform in front. Magistrates and persons of quality were placed on the lower tiers, the middle seats were appropriated to the common people; and if females attended the theatre, which has been doubted, they occupied the highest range. The seats were reached by staircases, which mounted from tier to tier at equal distances from each other. What the French call the *parterre*, and we the pit, was not given up to spectators, but was occupied by the chorus, whose duty it was to sing or recite the lyrical pieces which formed a large portion of every play. In the middle of this space, then termed the orchestra, there was an elevated altar, on which sacrifice was offered before the drama commenced, and steps surrounded it, upon which the performers making the chorus stood when they were engaged in dialogue by the mouth of their *coryphæus* with the actors on the stage. This band of performers personated, just as the ends of the drama were best answered, aged men or venerable matrons, young men or priests. They were divided into two companies, who danced in time to the music whilst they recited the words assigned to them. When repeating the strophe they moved from right to left, then during the antistrophe from left to right; but when the epode was chanting, they looked full upon the audience. The style of the dance was of course regulated by the character of the music, and that again by the nature of the poetry which it accompanied. Great skill was frequently displayed by the dancers in adapting their gestures to the subject of the drama, and even to represent the course of the action. The name of one

performer has been given whose movements were supposed to express very distinctly the events of the Seven Chiefs of Thebes, by *Œschylus*. The music introduced during the performance was probably not more than sufficient to guide the dances, and to assist the voices of the singers, without putting forward any claim to attention on its own account. The lyre, the flute, and the pipe, swelled with their blended sweetness, without overwhelming the vocal harmonies of the chorus; and although these simple instruments were manifestly incapable of producing the grand musical effects of modern orchestras, we may well believe that, acutely alive as the Grecians were in all matters of taste, they succeeded in forming an exquisite combination of voice and instrument.

That part of the stage on which the actors stood when speaking was termed the *logeum*; it was narrow in proportion to its length, covered with awning, and moveable. Behind, a wall rose to the height of the loftiest tier of seats, and between this wall and the *logeum* were placed the *proscenium* and the decorations. A palace or temple was usually represented in the back-ground, and views of distant scenery were given at the sides. It seems probable that in some cases the open country was permitted to be seen. It is noticeable that situations of great beauty were selected for the theatres: thus the theatre of Taurominium, in Sicily, was so constructed that the audience had Mount *Ætna* in prospect. The theatre at Athens commanded Mount *Hymettus*, the Saronic Gulf, and the three ports of Piræus. Immediately above it stood the Parthenon on its Acropolis. 'The beautiful situation,' says an intelligent writer, 'occupied by the remains of many of the ancient theatres, justifies the supposition that they were studiously placed so as to command and to incorporate with their own architectural features the finest objects of the adjacent country. The majestic mountains and luxuriant plains, the groves and gardens, the land-locked and open sea, in the neighbourhood of many of the principal cities of Greece, presented the finest materials which taste could suggest or desire for such combinations. But the charm of southern landscape depends not solely on the romantic or beautiful features which enter into its composition. In that land of the sun, the purity of the atmosphere, the rich and magical lines of colour, the soft loveliness of the aerial perspective, the powerful relief of light and shadow, produce impressions of pleasure rarely equalled, even in our finest days, in these northern regions.'

The machinery of the stage was very simple, and it was concealed from view as much as possible; for the Greeks were desirous that their representations should rely as little as need be upon stage artifices. There were various entrances for the performers. The chorus came in at a door in the orchestra, which it seldom quitted for the stage. There was also an entrance in the orchestra for characters who were supposed to come from a distance, and they attained the *logeum* by a staircase. On the *logeum* itself there was another entrance, and by this the inhabitants of the town found their way. Again, there were three points of ingress in the back wall of the scene; through the main one the great characters came before the audience, whilst the side ones served for subordinate persons. The scene was generally adorned with columns and statues in rich variety; and we are told that vases and hollow vessels were distributed here and in other parts of the theatre, for the purpose of aiding the diffusion of sound.

We may now allude to the appearance of the actors on the stage. The Grecian eye, acquainted with formal grace in all its shapes, demanded not only that every action should be conducted with submission to their severe rules of taste, but that the arrangements of all persons on the stage should be governed by the same rules. The actors were taught to fall into exquisite groups, and to feast the eye with the beauty of symmetry and proportion, whilst the ear was delighted with the sound of the most musical of languages. Thus the theatre was a place which the artist and the poet might frequent with equal instruction. The narrowness of the stage would throw the figures into strong relief, its length

would bestow a frieze-like appearance on the whole disposition, and the mechanical aids that were called in for the regulation of light would materially increase the statuesque effect. *Æschylus* derived part of his celebrity from his improving the costume of his characters. The deities he placed on the stage were clothed in imitation of the finest and most appropriate statues; and the drapery of all his performers was arranged with such elegance, that the priests were furnished with hints for a more finished style of dress in themselves. In the same way Romney the painter is said to have reformed the fantastic method of arranging the hair of ladies, prevalent at the close of the last century, by showing in some of his pictures the superior effect of a more natural manner.

MISCELLANEA.

The Scur of Egg is a magnificent pillar of basalt that rises in one of the Western Islands, above a stratum of oolite rock, containing fossil remains of a peculiar pine of that era, when the earth contained no animals superior to birds and reptiles. In the *Witness* (Edinburgh newspaper), there is at present in progress a series of chapters descriptive of a visit paid last summer to these islands by the editor, Mr Hugh Miller, whose speculations on the old red sandstone have made his name well known to geologists. The extraction of some specimens of the *Pinites Eggenensis*, as it is called, from the oolitic bed underneath the Scur, forms the occasion of some curious remarks in the third chapter.

After speaking of the oolite stratum as formed in the sea, and afterwards upheaved by volcanic agency with the mass of basalt over it, the writer thus proceeds:—'The annual rings of the wood, which are quite as small as in a slow-growing Baltic pine, are distinctly visible in all the better pieces I this day transferred to my bag. In one fragment I reckon sixteen rings in half an inch, and fifteen in the same space in another. The trees to which they belonged seem to have grown on some exposed hill-side, where, in the course of half a century, little more than from two to three inches were added to their diameter. Viewed through the microscope in transparent slices, longitudinal and transverse, it presents, within the space of a few lines, objects fitted to fill the mind with wonder. We find the minutest cells, glands, fibres, of the original wood preserved uninjured; there still are those medullary rays entire that communicated between the pith and the outside; there still the ring of thickened cells that indicated the yearly check which the growth received when winter came on; there the polygonal reticulations of the cross section, without a single broken mesh; there, too, the elongated cells in the longitudinal one, each filled with minute glands that take the form of double circles; there, also, of larger size and less regular form, the lacunae in which the turpentine lay; every nicely-organised speck, invisible to the naked eye, we find in as perfect a state of keeping in the incalculably ancient pile-work on which the gigantic Scur is founded, as in the living pines that flourish green on our hill-sides. A net-work, compared with which that of the finest lace ever worn by the fair reader would seem a net-work of cable, has preserved entire, for untold ages, the most delicate peculiarities of its pattern. There is not a mesh broken, nor a circular dot away!'

From facts plainly placed before our eyes, 'we now know,' says Mr Miller, 'that the ancient Egg pine, to which the detached fragment picked up at the base of the Scur belonged—a pine alike different from those of the earlier carboniferous period and those which exist contemporary with ourselves—was, some three creations ago, an exceedingly common tree in the country now called Scotland; as much so, perhaps, as the Scotch fir is at the present day. The fossil trees found in such abundance in the neighbourhood of Helmsdale, that they are burnt for lime—the fossil wood of Eathie, in Cromartyshire, and that of Shandwick, in Ross—all belong to the *Pinites Eggenensis*. It seems to have been a straight and stately tree, in most instances, as in the Egg specimens, of slow growth. One of the trunks I saw near Nairdale measured two feet in diameter, but a full century had passed ere it attained to a bulk so considerable; and a splendid specimen in my collection from the same locality, which measures twenty-one inches, exhibits even more than a hundred annual rings. In one of my specimens, and one only, the rings are of great breadth. They differ from those of all the others in the

proportion in which I have seen the annual rings of a young vigorous fir that had sprung up in some rich moist hollow, differ from the annual rings of trees of the same species that had grown in the shallow hard soil of exposed hill-sides. And this one specimen furnishes curious evidence that the often-marked but little understood law, which gives us our better and worse seasons in alternate groups, various in number and uncertain in their time of recurrence, obtained as early as the age of the oolite. The rings follow each other in groups of lesser and larger breadth. One group of four rings measures an inch and a quarter across, while an adjoining group of five rings measures only five-eighths parts; and in a breadth of six inches there occur five of these alternate groups. For some four or five years together, when this pine was a living tree, the springs were late and cold, and the summers cloudy and chill, as in that group of seasons which intervened between 1835 and 1841; and then for four or five years more springs were early and summers genial, as in the after group of 1842, 1843, and 1844. An arrangement in nature—first observed, as we learn from Bacon, by the people of the Low Countries, and which has since formed the basis of meteoric tables, and of predictions, and elaborate cycles of the weather—bound together the twelvemonths of the oolitic period in alternate bundles of better and worse: vegetation thrived vigorously during the summers of one group, and languished in those of another in a state of partial development.'

Captain Osborne, in his work entitled *The Court and Camp of Runjeet Sing*, gives an account of a Fakir who professed to have an extraordinary power of suspending animation in his body for a great length of time, during which he allowed himself to be kept in a burial vault, apart from all supply of air and food. 'The monotony of our camp life,' he says, 'was broken this morning by the arrival of a very celebrated character in the Punjab, a person we had all expressed great anxiety to see, and whom the Maha-Rajah had ordered over from Umruetar on purpose. He is a fakir by name, and is held in extraordinary respect by the Sikhs, from his alleged capacity of being able to bury himself alive for any period of time. So many stories were current on the subject, and so many respectable individuals maintained the truth of these stories, that we all felt curious to see him. He professes to have been following this trade, if so it may be called, for some years, and a considerable time ago several extracts from the letters of individuals who had seen the man in the Upper Provinces, appeared in the Calcutta papers, giving some account of his extraordinary powers, which were at the time, naturally enough, looked upon as mere attempts at a hoax upon the inhabitants of Calcutta. Captain Wade, political agent at Ludhiana, told me that he was present at his resurrection after an interment of some months; General Ventura having buried him in the presence of the Maha-Rajah and many of his principal sirdars; and, as far as I can recollect, these were the particulars as witnessed by General Ventura:—After going through a regular course of preparation, which occupied him seven days, and the details of which are too disgusting to dilate upon, the fakir reported himself ready for interment in a vault which had been prepared for the purpose by order of the Maha-Rajah. On the appearance of Runjeet and his court, he proceeded to the final preparations that were necessary in their presence, and after stopping with wax his ears and nostrils, he was stripped and placed in a linen bag; and the last preparation concluded by turning his tongue forwards, and thus closing the gullet, he immediately died away in a kind of lethargy. The bag was then closed, and sealed with Runjeet's seal, and afterwards placed in a small deal box, which was also locked and sealed. The box was then placed in a vault, the earth thrown in and trod down, and a crop of barley sown over the spot, and sentries placed round it. The Maha-Rajah was, however, very sceptical on the subject, and twice in the course of the ten months he remained under ground, sent people to dig him up, when he was found to be in exactly the same position, and in a state of perfectly suspended animation. At the termination of the ten months, Captain Wade accompanied the Maha-Rajah to see him disinterred, and states that he examined him personally and minutely, and was convinced that all animation was perfectly suspended. He saw the locks opened and the seals broken by the Maha-Raja, and the box brought into the open air. The man was then taken out, and on feeling his wrist and heart, not the slightest pulsation was perceptible. The first thing to-

performance of his feat, so far from rendering the latter more wonderful, serves but to hide the means he employs for its accomplishment, and until he can be persuaded to undergo the confinement in a place where his actions may be observed, it is needless to form any conjectures regarding them."

THE FEARLESS DE COURCY.

The following is a specimen of *Lays and Ballads from Old English Story* (London, James Burns, 1845), a beautifully embellished little volume of original poetry, professedly "by S. M.," and dedicated seven dear children, for whose amusement the verses were finally written. Generally speaking, history in a versified shape is a miserable trash; but here we have something very different; and shall be much surprised if this volume does not long maintain a place amongst the parlour-window favourites of the young. The lays are not only charmingly written, as far as mere literary art concerned, but have, besides, a life-like spirit, and a tone of high imaginative feeling, which are peculiarly their own.]

The fame of the fearless De Courcy
Is boundless as the air;
With his own right hand he won the land,
Of Ulster, green and fair!
But he lieth low in a dungeon now,
Powerless, in proud despair;
For false King John hath cast him in,
And closely chained him there.

The noble knight was weary
At morn, and eve, and noon;
For chilly bright seemed dawn's soft light,
And icily shone the moon;
No gleaming mail gave back the rays
Of the dim unfriendly sky,
And the proud free stars disdained to gaze
Through his lattice, barred and high.

But when the trumpet-note of war
Rang through his narrow room,
Telling of banners streaming far,
Of knight, and steed, and plume;
Of the wild *salles*, and the *cabers*' clash,
How would his spirit bound!
Yet ever after the lightning's flash,
Night cloeth darker round.

Down would he sink on the floor again,
Like the pilgrim who sinks on some desert plain,
Even while his thirsting ear can trace
The hum of distant streams;
Or the maimed bound, who hears the chase
Sweep past him in his dreams.

The false king sate on his throne of state,
"Mid knights and nobles free;
'Who is there,' he cried, 'who will cross the tide,
And do battle in France for me?
There is cast on mine honour a fearful stain,
The death of the boy who ruled Bretagne;"
And the monarch of France, my bold suzerain,
Hath bidden a champion for me appear,
My fame from this darkening blot to clear.
Speak—*is* your silence the silence of fear,
My knights and my nobles? Prowling and pale
Your faces grow as I tell my tale!
Is there not one of this knightly ring,
Who dares do battle for his king?"

The warriors they heard, but they spake not a word;
The earth some gazed upon;
And some did raise a steadfast gaze
To the face of false King John.
Think ye they feared? They were Englishmen all,
Though mutely they sate in their monarch's hall;
The heroes of many a well-fought day,
Who loved the sound of a gathering fray,
Even as the lonely shepherd loves
The herds' soft bell in the mountain-groves.
Why were they silent? There was not one
Who could trust the word of false King John;
And their cheeks grew pallid as they thought
On the deed of blood by his base hand wrought;
Pale, with a brave heart's generous fear,
When forced a tale of shame to hear.

'Twas a coward whiteness then did chase
The glow of shame from the false king's face;
And he turned aside, in bootless pride,
That witness of his guilt to hide;
Yet every heart around him there,
Witness against him more strongly bore!

was placed on the crown of his head, a plug of wax was next removed from one of his nostrils, and on this being done, the man breathed strongly through it. The mouth was now opened, and the tongue, which had been closely applied to the roof of the mouth, brought forward, and both it and the lips anointed with ghee (clarified butter). During this part of the proceeding, I could not feel any pulsation at the wrist, though the temperature of the body was much above the natural standard of health. The legs and arms being extended, and the eyelids raised, the former were well rubbed, and a little ghee was applied to the latter; the eyeballs presented a dim suffused appearance, like those of a corpse. The man now evinced signs of returning animation; the pulse became perceptible at the wrist, whilst the unnatural temperature of the body rapidly diminished. He made several ineffectual efforts to speak, and at length uttered a few words, but in a tone so low and feeble as to render them inaudible. By and by his speech was re-established, and he recognised some of the bystanders, and addressed the Maha-Raja, who was seated opposite to him watching all his movements. When the fakir was able to converse, the completion of the feat was announced by the discharge of guns and other demonstrations of joy. A rich chain of gold was placed round his neck by Runjeet, and ear-rings, bangles, and shawls were presented to him. However extraordinary this fact may appear, both to the Europeans and natives, it is difficult, if not impossible, to explain it on physiological principles. The man not only denied his having tasted food or drink, but even maintained that he had stopped the function of respiration during a period of forty days and nights. To all appearance this long fasting had not been productive of its usual effects, as the man seemed to be in rude health, so that digestion and assimilation had apparently proceeded in the usual manner; but this he likewise denied, and piously asserted, that during the whole time he had enjoyed a most delightful trance. It is well known that the natives of Hindoostan, by constant practice, can bring themselves to exist on the smallest portion of food for several days; and it is equally true that, by long training, the same people are able to retain the air in their lungs for some minutes; but how the functions of digestion and respiration could be arrested for such a length of time, appears unaccountable. The concealment of the fakir during the

* Prince Arthur of Brittany, whose melancholy fate has been too often the theme of song and story to require notice here.

Oh, out then spake the beauteous queen :
 ' A captive lord I know,
 Whose loyal heart hath ever been
 Eager to meet the foe ;
 Were true De Courcy here this day,
 Freed from his galling chain,
 Never, oh never should scoffers say,
 That amid all England's rank and might,
 Their king had sought him a loyal knight,
 And sought such knight in vain !'
 Up started the monarch, and cleared his brow,
 And bade them summon De Courcy now.
 Swiftly his messengers hastened away,
 And sought the cell where the hero lay ;
 They bade him arise at his master's call,
 And follow their steps to the stately hall.
 He is brought before the council—
 There are chains upon his hands ;
 With his silver hair, that aged knight,
 Like a rock o'erhung with foam-wreaths white,
 Proudly and calmly stands.
 He gazes on the monarch
 With stern and star-like eye ;
 And the company muse and marvel much,
 That the light of the old man's eye is such,
 After long captivity.
 His fetters hang upon him
 Like an unheeded thing ;
 Or like a robe of purple worn
 With graceful and indifferent scorn
 By some great-hearted king.
 And strange it was to witness
 How the false king looked aside ;
 For he dared not meet his captive's eye !
 Thus ever the spirit's royalty
 Is greater than pomp and pride !
 The false king spake to his squires around,
 And his lifted voice had an angry sound :
 ' Strike ye the chains from each knightly limb !
 Who was so bold as to fetter him ?
 Warrior, believe me, no host of mine
 Bade them fetter a form like thine ;
 Thy sovereign knoweth thy fame too well.'
 He paused, and a cloud on his dark brow fell ;
 For the knight still gazed upon him,
 And his eye was like a star ;
 And the words on the lips of the false king died,
 Like the murmuring sounds of an ebbing tide
 By the traveller heard afar.
 From the warrior's form they loosed the chain ;
 His face was lighted with calm disdain ;
 Nor cheek, nor lip, nor eye gave token
 E'en that he knew his chains were broken.
 He spake—no music, loud or clear,
 Was in the voice of the gray-haired knight ;
 But a low stern sound, like that ye hear
 In the march of a mail-clad host by night.
 ' Brother of Cœur de Lion,' said he,
 ' These chains have not dishonoured me !'
 There was crushing scorn in each simple word,
 Mightier than battle-axe or sword.
 Not long did the heart of the false king thrill
 To the touch of passing shame,
 For it was hard, and mean, and chill ;
 As breezes sweep o'er a frozen rill,
 Leaving it cold and unbroken still,
 That feeling went and came ;
 And now to the knight he made reply,
 Pleading his cause right craftily ;
 Skilled was his tongue in specious use
 Of promise fair and of feigned excuse,
 Blended with words of strong appeal
 To love of fame and to loyal zeal.
 At length he ceased ; and every eye
 Gazed on De Courcy wistfully.
 ' Speak !' cried the king in that fearful pause ;
 ' Will thou not champion thy monarch's cause ?'
 The old knight struck his foot on the ground,
 Like a war-horse hearing the trumpet sound ;
 And he spake with a voice of thunder,
 Solemn and fierce in tone,
 Waving his hand to the stately band
 Who stood by the monarch's throne,
 As a warrior might wave his flashing glaive
 When cheering his squadrons on :
 ' I will fight for the honour of England,
 Though not for false King John !'
 He turned and strode from the lofty hall,
 Now seemed to hear the sudden cheer
 Which burst, as he spake, from the lips of all.

* Isabella of Angoulême, wife to King John, celebrated for her beauty and high spirit.

And when he stood in the air without,
 He paused as if in joyful doubt ;
 To the forests green and the wide blue sky
 Stretching his arms embracingly,
 With stately tread and uplifted head,
 As a good steed tomes back his mane
 When they loose his neck from the servile rein ;
 Ye know not, ye who are always free,
 How precious a thing is liberty.
 ' O world !' he cried ; ' sky, river, hill,
 Ye wear the garments of beauty still ;
 How have ye kept your youth so fair,*
 While age has whitened this hoary hair ?'
 But when the squire, who watched his lord,
 Gave to his hand his ancient sword,
 The hit he pressed to his eager breast,
 Like one who a long-lost friend hath met ;
 And joyously said, as he kissed the blade,
 ' Methinks there is youth in my spirit yet.
 For France ! for France ! o'er the waters blue,
 False king—dear land—adieu, adieu !'
 He hath crossed the booming ocean,
 On the shore he plants his lance ;
 And he sends his daring challenge
 Into the heart of France :
 ' Lo, here I stand for England,
 Queen of the silver main !
 To guard her fame and to cleanse her name
 From slander's darkening stain !
 Advance, advance ! ye knights of France,
 Give answer to my call !
 Lo ! here I stand for England,
 And I defy ye all !'

From the east and the north came champions forth—
 They came in a knightly crowd ;
 From the south and the west each generous breast
 Throbbled at that summons proud.
 But though brave was each lord, and keen each sword,
 No warrior could withstand
 The strength of the hero-spirit
 Which nerved that old man's hand.
 He is conqueror in the battle—
 He hath won the wreath of bay ;
 To the shining crown of his fair renown
 He hath added another ray ;
 He hath drawn his sword for England ;
 He hath fought for her spotless name ;
 And the isle resounds to her farthest bounds
 With her gray-haired hero's fame.
 In the ears of the craven monarch,
 Oft must this burthen ring—
 ' Though the crown be thine and the royal line,
 He is in heart thy king !'
 So they gave this graceful honour
 To the bold De Courcy's race,
 That they ever should dare their helms to wear
 Before the king's own face :
 And the sons of that line of heroes
 To this day their right assume ;
 For, when every head is unbowed,†
 They walk in cap and plume !

ZINC RINGS FOR RHEUMATISM.

We find the following sensible note in a recent number of the *Agricultural Gazette*:—Galvanic rings are not of any more ascertained efficacy than metallic tractors, horse-shoe magnets, and the thousand-and-one humbugs that profess to afford relief to suffering humanity. The galvanic rings consist merely of a copper and zinc plate formed into a ring. The galvanic action of these metals, when the circle is completed by means of the moist skin, must be exceedingly small, and certainly not enough to produce an effect upon the diseased tissues of the body. In some cases they may have afforded relief, by diverting the attention of the patient from his disease to the remedy. It is, however, most probable, when persons get well after wearing them, that, like the king's touch for the evil, the cure was rather a coincidence than a consequence. The sellers of them assert that they can do no harm if they do no good. This is not altogether true. A medical friend of ours was called in the other day to a poor man who had worn one of these rings for rheumatism, and found his finger swollen and inflamed ; so that in this case much unnecessary pain—and the loss of a week's wages we presume—was the result of the experiment.

* The reader of German will here recognise an exquisite stanza from Uhland, very inadequately rendered.

† The present representative of the house of De Courcy is Lord Kinsale.

TUNNELLING BY THE ROMANS.

The following extraordinary account is set forth in a letter from Marseilles in the *Débat*:—There has been long known, or believed to exist at Marseilles, a tunnel or submarine passage passing from the ancient abbey of St Victoire, running under the arm of the sea, which is covered with ships, and coming out under a tower of Fort Saint-Nicolas. Many projects for exploring this passage have been entertained, but hitherto no one has been found sufficiently bold to persevere in it. M. Joyland, of the Ponts-et-Chaussées, and M. Matayras, an architect, have, however, not only undertaken, but accomplished this task. Accompanied by some friends and a number of labourers, they went a few days ago to the abbey, and descended the numerous steps that lead to the entrance of the passage. Here they were the first day stopped by heaps of the ruins of the abbey. Two days afterwards, however, they were able to clear their way to the other end, and came out at Fort Saint-Nicolas, after working two hours and twenty minutes. The structure, which is considered to be Roman, is in such excellent condition, that in order to put it into complete repair, a cost of no more than 500,000 francs will be required; but a much larger outlay will be wanted to render it serviceable for modern purposes. This tunnel is deemed much finer than that of London, being formed of one single vault of sixty feet span, and one-fourth longer.

A FACT FOR TEMPERANCE ADVOCATES.

One vulgar argument in favour of spirituous liquor is, that in winter it 'keeps out the cold.' That it creates for a short time an excitement productive of heat, there is no doubt; but when its short-lived influence has passed away, a reaction takes place, which causes the drinker to be infinitely colder than he would have been without it. In proof that people can get on without spirits in the most frigid parts of the world, we may instance a case mentioned in the third volume of Lord Monboddo's *Ancient Metaphysics*:—A gentleman named Andrew Graham, set out from Severn River (latitude 56° 10' north), in Hudson's Bay, in the depth of the winter of 1773, and travelled to Churohill River—a distance of 350 miles—without tasting spirits or sleeping under a roof. He was accompanied by three Europeans, six native Americans, and four Newfoundland dogs, who pulled in a sledge their luggage, consisting of beaver and blanket coverings, biscuit, bacon, flour, but no wine, beer, or other spirituous liquors; which Mr Graham did not choose to carry with him, because he knew his attendants would never be quiet till he had drank them all. Their drink was melted snow. They all arrived—after twenty days' exposure to the most severely cold climate in the world—at the end of their journey in perfect health; and Mr Graham says he never enjoyed his food nor ever slept better in his life. This anecdote is fatal to the supposition that alcohol is necessary to cold climates, as many suppose.

A SCOTCH MUSSULMAN.

Osman's history is a curious one. He was a Scotchman born, and when very young, being then a drummer-boy, he landed in Egypt with Mackenzie Fraser's force. He was taken prisoner, and, according to Mohammedan custom, the alternative of death or the Koran was offered to him. He did not choose death, and therefore went through the ceremonies which were necessary for turning him into a good Mohammedan. But what amused me most in his history was this, that very soon after having embraced Islam, he was obliged in practice to become curious and discriminating in his new faith, to make war upon Mohammedan dissenters, and follow the orthodox standard of the prophet in fierce campaigns against the Wahabees, who are the Unitarians of the Mussulman world. The Wahabees were crushed, and Osman, returning home in triumph from his holy wars, began to flourish in the world: he acquired property, and became effendi, or gentleman. At the time of my visit to Cairo, he seemed to be much respected by his brother Mohammedans, and gave pledge of his sincere alienation from Christianity by keeping a couple of wives. He affected the same sort of reserve in mentioning them as is generally shown by Orientals. He invited me, indeed, to see his harem, but he made both his wives bundle out before I was admitted. He felt, as it seemed to me, that neither of them would bear criticism; and I think that this idea, rather than any motive of sincere jealousy, induced him to keep them out of sight. The rooms of the harem reminded me of an English nursery rather than of a

Mohammedan paradise. One is apt to judge of a woman, before one sees her, by the air of elegance or coarseness with which she surrounds her house. I judged Osman's wives by this test, and condemned them both. But the strangest feature in Osman's character was his inextinguishable nationality. In vain they had brought him over the seas in early boyhood; in vain had he suffered captivity and conversion; in vain they had passed him through fire in their Arabian campaigns; they could not out away or burn out poor Osman's inborn love of all that was Scotch; in vain men called him effendi; in vain he swept along in eastern robes; in vain the rival wives adorned his harem. The joy of his heart still plainly lay in this, that he had three shelves of books, and that the books were thorough-bred Scotch—the Edinburgh this, the Edinburgh that; and, above all, I recollect he prided himself upon the 'Edinburgh Cabinet Library.'—*Traces of Travel.*

RESULTS OF A LITTLE NEGLECT.

I was once, in the country, a witness of the numberless minute losses that negligence in household regulation entails. For want of a trumpety latch, the gate of the poultry yard was for ever open; there being no means of closing it externally, 'twas on the swing every time a person went out, and many of the poultry were lost in consequence. One day a fine young porker made his escape into the wood, and the whole family, gardener, cook, milkmaid, &c. presently turned out in quest of the fugitive. The gardener was the first to discover the object of pursuit, and, in leaping a ditch to cut off his further escape, got a sprain that confined him to his bed for the next fortnight; the cook found the linen burnt that she had left hung up before the fire to dry; and the milkmaid having forgotten in her haste to tie up the cattle properly in the cow-house, one of the loose cows had broken the leg of a colt that happened to be kept in the same shed. The linen burnt and the gardener's work lost were worth full twenty crowns, and the colt about as much more; so that here was a loss in a few minutes of forty crowns, purely for want of a latch that might have cost a few halfpence at the utmost; and this in a household where the strictest economy was necessary; to say nothing of the poor man, or the anxiety and other troublesome incidents. The misfortune was, to be sure, not very serious, nor the loss very heavy; yet when it is considered that similar neglect was the occasion of repeated disasters of the same kind, and ultimately the ruin of a worthy family, 'twas deserving of some little attention.—*From the French.*

PERSEVERANCE.

All the performances of human art, at which we look with praise or wonder, are instances of the resistless force of perseverance: it is by this that the quarry becomes a pyramid, and that distant countries are united by canals. If a man was to compare the effect of a single stroke of a pick-axe, or of one impression of the spade, with the general design and last result, he would be overwhelmed by the sense of their disproportion; yet those petty operations, incessantly continued, in time surmount the greatest difficulties, and mountains are levelled, and oceans bounded, by the slender force of human beings.—*Dr Johnson.*

HUMANITY.

True humanity consists not in a squeamish ear; it consists not in starting or shrinking at tales of misery, but in a disposition of heart to relieve it. True humanity appertains rather to the mind than to the nerves, and prompts men to use real and active measures to execute the actions which it suggests.—*Charles James Fox.*

RICHES.

If men were content to grow rich somewhat more slowly, they would grow rich much more surely. If they would use their capital within reasonable limits, and transact with it only so much business as it could fairly control, they would be far less liable to lose it. Excessive profits always involve the liability of great risks, as in a lottery, in which, if there are high prizes, there must be a great proportion of blanks.—*Wayland.*

CAPABILITIES.

It has often been a question whether great men are the producers or the produced of great crises. We see a Cromwell live for forty years a quiet country-town life, till at length a national convulsion arising, he, being strongly interested in the views of one of the parties, dashes forward, and, before passing fifty, has all but the crown of England upon his head. Again, we see a French sous-lieutenant of artillery plunging into his country's history at a time of similar confusion, and making himself the most formidable sovereign upon earth before he is thirty-five. If we were to limit our regard to such facts as these, we should be disposed at once to conclude, that a man of powerful character is nothing, unless an opportunity arise for his entering upon a grand career. But, on the other hand, we often see a powerful mind arise in times comparatively tranquil, and work great marvels, apparently by its own inherent energies. We see at times what seem to be occasions for the coming forward of great men upon the stage, and yet they do not come. We then begin to think that perhaps a Cromwell or a Bonaparte contributes to some great, though indefinable extent, in producing the events to which his appearance at first seemed subordinate. We suspect that the civil wars of England, and the French Revolution, would not have taken the turn they did, but for the potent and overmastering influence of these individual actors. Thus we are prevented from coming to a decision on the point. And, in fact, this is a question which stands unsettled amongst thinking men until the present hour.

The question, as it appears to me, can never be definitely settled on one side or the other; for neither view is wholly true. But I believe that the truth preponderates in favour of the argument which considers men as requiring circumstances to evoke their mental powers. Strong, active, and original minds will ever tell to some degree upon their circumstances, be these as impassable as they may; but they cannot tell to a great degree, unless at a time when the social elements are in some confusion. And this is simply because, let a single mind be ever so powerful, the fabric of society and its conventionalities is, in ordinary circumstances, stronger still, so that no one can do more than merely modify it in some slight degree, or prepare the way for future operations whereby it may be affected. If the matter be narrowly examined, it will always be found that, where an occasion for the appearance of a great leader passed over without any one coming forward, the necessary stir of the social elements was wanting. The *vis inertiae* of the mass is what all single minds find fatal to them, when they attempt to do great things with their fellow-creatures. Hence a Luther, rising in the twelfth century, when the Romish church was at its highest pitch of

power, would have only broken his head against its walls. As an obscure heretic, his name would have been forgotten in a few years. Such minds as his must, in the course of nature, have arisen at various periods among the conventual brotherhoods; but they would never become distinguished for more than a somewhat latitudinarian way of dealing with the authority of the prior, or perhaps an occasional fractiousness at the elections of sacristans. It is like the wind-sown seed, much of which comes to nothing because it lights in stony places, while only what chances to fall on good ground fructifies. And there is another thing to be considered. The most powerful minds are more or less dependent upon things external to them, in order to be roused into due activity. Such a mind droops like the banner by the flag-staff, till the wind of occasion unfurls it. It may pine, and chafe, and wear itself out in vain regrets and ennui, like the prisoned huntsman, or, in the desperation of forced idleness, or unworthy occupation, waste itself upon frivolities idler than idleness itself. But still it will be for the most part a lost mind, unless circumstances shall arise capable of raising it to its full force, and eliciting all its powers. Here a consideration occurs, calling for some collateral remark. We are apt, at a tranquil period, to pity the men who have to fight through civil broils such as those in which Spain has for some years been engaged. In reality, these men are happier than we think them. They have the pleasure of feeling their faculties continually at the full stretch. Victorious or defeated, hunting or hunted, they are thoroughly engrossed in the passing day; not a moment for the torture of excessive ease. Providence is kind to the men who undertake dangerous enterprises. Even when death comes to them—no matter how dreadful his shape—he is met in a paroxysm of mental activity, which entirely disarms him of his terrors.

It follows from these considerations, that there must, at all but extraordinary times, be a vast amount of latent capability in society. Gray's musings on the Cromwells and Miltons of the village are a truth, though extremely stated. Men of all conditions do grow and die in obscurity, who, in suitable circumstances, might have attained to the temple which shines afar. The hearts of Roman mothers beat an unnoted lifetime in dim parlours. Souls of fire miss their hour, and languish into ashes. Is not this conformable to what all men feel in their own case? Who is there that has not thought, over and over again, what else he could have done, what else he could have been? Vanity, indeed, may fool us here, and self-tenderness be too ready to look upon the misspending of years as anything but our own fault. Let us look, then, to each other. Does almost any one that we know appear to do or to be all that he might? How far from it! Regard for a moment the manner in which a vast proportion of those who, from

independency of fortune and from education, are able to do most good in the world, spend their time, and say if there be not an immense proportion of the capability of mankind undeveloped. The fact is, the bond of union among men is also the bond of restraint. We are committed not to alarm or distress each other by extraordinary displays of intellect or emotion. There are more hostages to fortune that we shall not do anything great, than those which having children constitutes. Many struggle for a while against the repressive influences, but at length yield to the powerful temptations to nonentity. The social despotism presents the fetters with which it seeks to solace and beguile its victims; and he who began to put on his armour for the righting of many wrongs, is soon content to smile with those who smile. Thus daily do generations ripe and rot, life unenjoyed, the great mission unperformed. Do angels ever weep? If they do, what a subject for their tears in the multitude of young souls who come in the first faith of nature to grapple at the good, the true, the beautiful, but are instantly thrown back, helpless and mute, into the limbo of Commonplace. Oh Conventionality, quiet may be thy fireside hours, smooth thy pillowed thoughts; but at what a sacrifice of the right and the generous, of the best that breathes and pants in our nature, is thy peace purchased!

Is not one great cause of the dissatisfaction which rests on the close of most lives just this sense of having all the time made no right or full use of the faculties bestowed upon us? The inner and the true man pent up, concealed from every eye, or only giving occasional glimpses of itself in whimsical tastes and oddities—uneasy movements of undeveloped tendency—we walk through a masque called life, acting up to a character which we have adopted, or which has been imposed upon us, doing nothing from the heart, 'goring' our best thoughts to make them lie still. Pitiably parade! The end comes, and finds us despairing over precious years lost beyond recovery, and which, were they recovered, we would again lose. And, if such be a common case, can we wonder at the slow advance of public or national improvement? There must be a design with regard to highly-endowed natures, that they are to bear upon all around them with such intellectual and moral force as they possess, and thus be continually working on for the general good. This we might consider as a sort of pabulum requisite for the public health—something analogous to air or food with respect to the bodily system. But is this moral necessary of life diffused as it ought to be? Let the endless misdirections and repressions of human capability answer the question.

HISTORY OF THE FIREPLACE.

DURING the last few years, public attention has been laudably directed to the defective means which still exist for warming and ventilating houses. Although we have arrived at a high state of civilisation in some respects, yet the method still in use for producing an artificial climate in modern habitations, is perhaps more primitive and defective than any of our domestic contrivances. We burn coal in a vessel or stove which is no whit better in principle than the ancient fire-basket. Whilst the chimney-wall in each room is often heated like an oven, those opposite and at the sides are but a few degrees above the temperature of the atmosphere. In this respect the ancients evinced much greater ingenuity than we do; and many of the so-called inventions of modern date were, it appears, in general use hundreds and thousands of years ago. By the research of a recent author, many curious and interesting facts concerning warming and ventilation have been brought to light;* and as in this country all ideas of comfort

and sociality are centered around the hearth, we doubt not that a historical sketch of the 'fireplace,' chiefly drawn from the above source, will prove interesting.

The history of the fireside may be said to commence in the dark ages; for it reaches back to a time when man was unacquainted with the existence of fire. The early records of nearly all nations refer to a time when that element was unknown. Indeed instances of such ignorance have been met with in comparatively modern times. When Magellan visited the Marian Islands in 1521, the natives believed themselves to be the only people in the world. They were without everything which we regard as necessities, and in total ignorance of fire. Several of their huts being consumed, they at first considered the flame to be a kind of animal that attached itself to the wood, and fed upon it. Some who approached too near, being scorched, communicated their terror to the rest, who durst only look upon it at a distance. They were afraid, they said, that the terrible animal would bite them, or wound them with its violent breathing. They speedily learned to use fire with as much address as Europeans. Few historical facts, therefore, are less doubtful than that man was once without means of artificial heat. A Phœnician tradition attributed its discovery to a hunter observing a conflagration that had been excited in a forest by the attrition of some trees during a storm. Another tradition varies the account: in the winter season, Vulcan the king, coming to a tree on the mountains that had been fired by a thunderbolt, was cheered by its heat; and adding more wood to preserve it, he invited his companions to share in his pleasure, and thereupon claimed to be the inventor of flame. Fire once discovered, the primeval savages, though at first alarmed, gradually felt its blessed influence; and it is thus that tradition gives us an account of the earliest fireside; for around the embers of the burning trees men first learned to herd; and as the intercourse continued under the bond of the common enjoyment, the incoherent sounds by which they expressed their emotions were by degrees roughly cast into the elements of speech; thus the discovery of fire gave rise to the first social meeting of mankind, to the formation of language, to their ultimate union, and to all the wonders of subsequent civilisation.* The Chinese historians attribute the earliest power of producing fire at will, by the friction of two pieces of dried wood, to Soulgine, one of their first kings. This power once known, the nomadic races in all countries ever availed themselves of it; though a fire made of dried wood or grass in the open air, or in a rude tent, was their sole provision against cold for many ages.

Increased intelligence induced mankind to seek for greater warmth under substantial cover, and the first houses they took to were ready built, being chiefly caves. In the middle of these they made fires, in spite of the smoke, for which there was no other outlet than the hole by which the inhabitants came in and out. The same rude method was continued even when men learnt to build houses, and to congregate in cities; only they made a hole in the roof to let the smoke out, exactly like the Laplanders and some of the Irish at the present day.

The parents of western civilisation, the Egyptians, although they built themselves excellent houses, and were scrupulously nice in their domestic arrangements, either made their fires (for it is cold enough even in that warm climate to need them occasionally) on a central hearth, or used pans of live charcoal to carry about from one room to another. To them is ascribed the invention of bellows to concentrate the energy of fire. The reader will see in the second volume of Wilkinson's *Manners and Customs of the Ancient Egyptians*, copies of that instrument taken from paintings on tombs, at least three thousand years old. During the exode and wanderings of the Jews, their fireplaces were precisely like those

* On the History and Art of Warming and Ventilating Rooms and Buildings, &c. By Walter Barnan, Civil Engineer. 2 vols. Bell: London.

* Vitruvius, b. II. c. 1.

both of the primitive races and of the modern Arabs—small bonfires in conical tents, with a hole in the apex of the cone to let out the smoke; but after their establishment in Canaan, their houses, it has been inferred, resembled those of the Egyptians, 'wide, thorough aired with windows, and large chambers ceiled with cedar, and painted with vermilion;* and, judging from the terms they had to mark the position, size, and manner of closing the apertures, they must have paid great attention to domestic accommodation. The winter in Palestine being cold and long, and wood abundant, particular apartments were appropriated to the season when fires were wanted, to avoid the nuisance of smoke pervading the house, and soiling its furniture and ornaments. About the latter end of November, king Jehoiakim was sitting in his 'winter house,' when he threw the roll of Baruch 'into the fire that was burning on the hearth before him.' The prophet Amos alluded to the same custom, when he declared that the 'winter house, with the summer house,' would be destroyed. From the hearths and braziers in these brumal apartments, the smoke was emitted at a hole in the roof, or by the *arubbah*; for, notwithstanding what some rabbis have written about the Jews being so scrupulous to preserve the purity of the Holy City, that they would not permit the erection of a chimney in Jerusalem, they were, perhaps, as ignorant as the Egyptians of that contrivance. The great improvement that chimneys would have made on Mount Sion itself, is graphically described by Baruch, when he notices 'the faces that were blacked by the smoke that cometh out of the temple.'

The method of using fuel among the Greeks was the same as among the Hebrews, but perhaps without their care for ventilation. Homer describes his princes undressing themselves in the palace, to kill with their own hands the sheep, oxen, and swine they were to eat at dinner; roasting the entrails, and during the entertainment handing them to each other as delicacies. The repast being finished, he shows them sitting for their pleasure on the piled skins of the animals they had slain and devoured, and playing at games of chance, and one of them taking a pastern bone out of a basket in which it was lying, and throwing it at the head of a beggar, but on missing its aim, making a grease spot where it fell on the opposite wall. From this picture of the grossness of ancient manners, it may be concluded that when the poet says, Penelope's maids threw the glowing embers out of the braziers upon the floor, and heaped fresh wood upon them, he did not mean to depict his immortal barbarians burning odoriferous fuel on purpose to sweeten what must have been a vitiated atmosphere. The fire that was quickly to blaze on the hearth, had to diffuse the comforts of light as well as warmth; and the fragrant logs were known to abound with the resinous material of illumination. In the heroic age, they had oil and tallow in abundance, but were ignorant of the method of burning them in lamps; and the only use they appear to have made of wax, was to put it in the ear to shut out sound. Burning fuel was carried into the apartment where light was required, and sometimes placed on altars for the same purpose; and long thin pieces of lighted wood were carried in the hand when they moved from one place to another in the night.

Coal, it has been thought, was known to the Greek naturalists. Theophrastus speaks of fossil substances found in Liguria, and in Elis, in the way to Olympia, and used by smiths, that when broken for use are earthy, and that kindled and burned like wood-coal. The general fuel was green wood; and where that was unattainable, other vegetable and even excrementitious substances were used on the hearth for combustibles. On days of ceremony, it was also customary to burn fragrant substances. When Alexander the Great was at an entertainment, given in the winter by one of his friends, 'a brazier was brought into the apartment to warm it. The day being cold, and the king observing

the small quantity of fuel that had been provided, jeeringly desired his host,' says Plutarch, 'to bring more wood or incense.' The supply of the precious firing appeared to the king too scanty for producing the required warmth; and if it arose from his host being niggardly of the costly fuel, he hinted that some even of the common sort would be acceptable.

The Romans made vast strides of improvement in fireplaces, although they were quite unable to rid themselves of the smoke nuisance. Vitruvius, in his work on architecture, directs that the walls of rooms 'in which fires or many lights are burned, should be finished above the *podium* with polished panels of a black colour, having red or yellow margins round them; and he advises that delicate ornaments should not be introduced into the cornices, because they are spoiled, not only by the smoke of the house, but also by that from the neighbouring buildings.' The principal fireplace in a Roman house of the best kind was built in the bath, chiefly to heat the *caldarium* or sweating-room of a bath. It was a sort of furnace, and called a *hypocaust*, and served also to heat the walls of the whole habitation; quite upon the principle of the hot-air system which has recently been introduced as a modern invention. 'The hypocaust being constructed in the under storey of a building, in the manner described by Vitruvius, several pipes of baked clay were then built into the walls, having their lower ends left open to the hypocaust. These pipes were carried to the height of the first or second storey, and had their upper orifices made to open into the chamber that was to be heated. They were closed by moveable covers. While green wood was burning in the furnace, and the hypocaust filled with its acrid smoke, the covers were not removed from the caliducts; but as soon as the wood was charred, the upper orifices of the pipes were opened, and the hot vapour from the hypocaust then flowed into the chamber.' It is singular, that although these hot-air ducts would have answered to carry off smoke, the Romans never hit upon the expedient of applying them to that purpose.

The excavations of Pompeii have revealed to us the family hearths of the Romans, such as were used in rooms not sufficiently heated by the hypocaust. The general method of procuring a warm in-door climate, was by burning charcoal in a brazier on the pavement in the middle of the room, and allowing the vapour to exude at the door and window. These braziers and tripods, formed of all sizes, in iron and bronze, occasionally displayed great elegance of design and neatness of workmanship, and sometimes were contrived to heat water. One of this description, in the museum at Naples, is 28 inches square, and has four towers, one at each angle, fitted with a lid that can be raised by a ring. The fire-hearth is placed in the square part in the middle, which is lined with iron, as in the common braziers. The fluid to be heated was contained in the towers. Another use of these cup-like towers reminds us once more that there is nothing new under the sun. When Dr Arnott's stove was introduced, it was found to have an injuriously drying effect upon the air, consequently a vase of water was added, to supply the necessary humidity by evaporation. Now, what says Mr Bernal on the use of these foculari? 'The cold dry air of an Italian winter and spring was desiccated to a high degree after being expanded by the heat of a hypocaust, or a fire of charcoal; and these braziers appear a very elegant method of diffusing that quantity of moisture in the air of an apartment that was necessary to make it agreeable and salubrious. Perhaps the evaporation was partially regulated by shutting or opening the lids of the water vessels.'

When the Romans landed in Britain, they found our savage forefathers living either in detached wigwags of wicker-work, in huts of loose stones without chimney or window, or in excavated caves, like the Germans, surrounded by their winter provisions, and stifled with smoke. The following fireside picture is drawn from the Welsh historian Gyrldus:—'Families inhabit a large hut or house, which, having a fire in the midst,

* Jerem. xxii. 14.

serves to warm them by day and to sleep round by night; and he describes the bands of young men who followed no profession but arms, visiting families to whom they were always welcome, and passing the day with the most animated cheerfulness. At length, sunk into repose on a thin covering of dried reeds, spread round the great fire placed in the middle, they lay down promiscuously, covered only by a coarse-made cloth called *brychan*, and kept one another warm by lying close together; and when one side lost its genial heat, they turned about, and gave the chilly side to the fire. The great men endeavoured to improve on this custom during the day. A Welsh prince had an officer in his court called a foot-bearer, whose duty it was, at meal-times, when his master was seated at table, to sit with his back to the fire, and keep the princely feet warm and comfortable by cherishing them in his bosom. In the later feudal times, the spacious lofty hall, left open to the roof, had its windows placed high from the floor, and filled with oiled linen or louver boards, or occasionally with painted glass. The floor of stone or earth had a part at one end raised a little above the general level, and laid with planks. On this platform or dais stood a massive table, and ponderous benches or forms, and a high-backed seat for the master under a canopy. On the hearth, in the middle of the hall, were placed the andirons for supporting the ends of the brands, that were arranged by means of a heavy two-pronged fork, the type and predecessor of the modern poker. On the roof over the hearth was a turret or louver, filled with boards arranged so as to exclude rain and wind, and permit the escape of smoke; and this was sometimes an object of considerable architectural beauty in the external aspect of the building. In this gaunt and aguish apartment, heated by a single fire, the company were in a position not much different from what they would be in the open air: not a particle of heated air could add to their comfort, for as fast as produced, it escaped through the louver: light was the only solace the greater number could derive from the blazing fuel; and the few who were in a situation to feel the radiant heat, were incommoded by the current of cold air sweeping like a hurricane along the floor towards the fire. From the height of the louver, and low temperature of the smoke, few of the buoyant flakes of charcoal found their way into the atmosphere; and the larger the bonfire the thicker was the layer of soot deposited on each individual. Boisterous weather also brought its annoyance. Had the fire been made in an open field, they might have moved to the windward of the smoke, but in the hall, where could they flee to from its miseries? The country houses of inferior landholders and farmers were generally one storey high. If they were built with two storeys, the roof was so deep as to reach to the ceiling of the lower room. The hall and kitchen forming one apartment, and roughly plastered, was open to the timbers of the roof, and sometimes had a louver, and a window that could be closed with a shutter:

'Barre we the gates,
Cheke we and cheyne we and eche chyno stoppe,
That no light leopen yn at lover ne at loupe.*

When these houses had a room to sleep in, old and young reposed in the same apartment, and several in one bed; servants made their beds on the floor in the kitchen.

Cottages had neither louver nor loupe, and their inmates lay round the fire. Longlande describes one of a vagrant group:—

'Suten at even by the hote coles,
Unlouk his legges abrod other lygge at hus ees,
Rest hym and roste hym and his ryg turn,
Drynke drue and deepe, and draw hym than to bedde.'

In lodging-houses, the same packing system was followed, and when a person had a bed to himself, it was

a mark of distinction, and recorded accordingly. In the magnificent strongholds, built near the time of the Conquest, a central hearth is seldom found. Having several storeys in height, and their roofs being used as a terrace for defence, an exit in the common form for the smoke, even from the uppermost chambers, would have been impracticable. A huge recess, therefore, was built at one side of the hall, and on its hearth fuel was burnt, the smoke finding egress by a contrivance which may be regarded as a chimney in its infancy. Over the hearth was a sort of huge funnel, or hole in the wall, which sloped up through its thickness, till it reached daylight in the outer side of the wall.

Wood, turf, and furze were almost the only fuel. The first legal mention of coal was made in 1239, when Henry III. granted a charter to the inhabitants of Newcastle to dig for it; but so great was the prejudice against it, from an erroneous notion that it was injurious to the health, that it was not in general use till the seventeenth century. Meanwhile, the funnel-like smoke-duct of the feudal castle became gradually improved into a chimney. Leland says in his *Itinerary*, speaking of Bolton Castle, 'One thyng I muche notyd in the hawle of Bolton, how chimeneys were conveyed by tunnells made on the sydes of the walls betwixt the lights in the hawle, and by this means, and by no covers, is the smoke of the harthe in the hawle wonder *strangely* conveyed.*'

Chimneys were afterwards generally adopted. To old buildings they were added, whilst new ones were never constructed without what a wordy author calls 'the elegant and commodious tube now known by the name of a chimney.' By its help the fireside was greatly improved.

The following description applies to the firesides of the end of Henry VIII.'s reign, by which time chimneys or flues had become universal:—'The windows had curtains, and were glazed in the manner described by Erasmus; but in inferior dwellings, such as those of copyholders and the like, the light-holes were filled with linen, or with a shutter. The hearth-recess was generally wide, high, and deep, and had a large flue. The hearth, usually raised a few inches above the floor, had sometimes a halpas or dais made before it, as in the king's and queen's chambers in the Tower. Before the hearth-recess, or on the halpas, when there was one, a piece of green cloth or tapestry was spread, as a substitute for the rushes that covered the lower part of the floor. On this were placed a very high-backed chair or two, and footstools, that sometimes had cushions, and, above all, high-backed forms and screens—both most admirable inventions for neutralising draughts of cold air in these dank and chilling apartments. Andirons, fire-forks, fire-pans, and tongs, were the implements to supply and arrange the fuel. Hearth-recesses with flues were common in the principal chambers of houses of persons of condition; and were superseding what Aubrey calls flues, like louver holes, in the habitations of all classes. The adage, that "one good fire heats the whole house," was found true only in the humbler dwellings; for in palace and mansion, though great fires blazed in the presence chamber, or hall, or parlour, the domestics were literally famishing with cold. This discomfort did not, however, proceed from selfish or stingy housekeeping, but rather from an affectation of hardihood, particularly among the lower classes, when effeminacy was reckoned a reproach. Besides, few could know what comfort really was; but those who did, valued it highly. Sanders relates that Henry VIII. gave the revenues of a convent, which he had confiscated, to a person who placed a chair for him commodiously before the fire, and out of all draughts.'

* Though many authors antecedent to Leland use the term 'chimney,' yet they mean by that word simply 'fireplace,' or 'hearth-recess'; and the verbal equivalent to the word in the Reformer's Testament is 'furnace.' Leland himself, in using the word, almost defines it by saying, 'that the chimeneys were conveyed by tunnells; or, in other words, the fireplace was continued by a tunnel to the top of the building.'

This description of an English fireside is accurate, even applied to a much later period—to indeed all the intervening space between the time of Queen Mary and that of William, Prince of Orange; for it was not till the latter reign that coal became the staple fuel. The prejudice against it, which we have before adverted to, was as strong as it was unaccountable. As an instance of it, we may mention, in passing, that when first introduced, the Commons petitioned the crown in 1306 to prohibit burning the 'noxious' fuel. A royal proclamation having failed to abate the growing nuisance, a commission was issued to ascertain who burned sea-coal within the city and in its neighbourhood, and to punish them by fine for the first offence, and by demolition of their furnaces if they persisted in transgression; and more vigorous measures had to be resorted to. A law was passed making it a capital offence to burn sea-coal within the city of London, and only permitting it to be used in forges in the neighbourhood. Among the records in the Tower, Mr Astle found a document, importing that in the time of Edward I., a man had been tried, convicted, and executed, for the crime of burning sea-coal in London. It took, then, three centuries to efface this prejudice; but when once coal was adopted, the whole aspect of the fireside was changed. For the capacious hearth, was substituted the narrower, less social, though compact and tidy one now in use. Chimney-pieces were introduced at first elaborately carved in wood, and afterwards of marble. The fire—held in a grate or stove—was smaller and more concentrated to one part of the room. Despite the hosts of inventions which have for more than a century been in use to improve the grate, it still remains in principle and general utility the same as it did from the first day coal was generally burned. And despite the patents of Polignac, Bernhard, Evelyn, Rumford, for open grates, and those of Arnott and others for closed ones, our family circles still draw around a fireplace differing in no very essential particular from that which warmed our grandfathers and grandmothers. So little good have all modern contrivances really effected, that we of the present hour suffer the same inconveniences as the occupants of the Welsh fireside in the dark ages: when we remain near the fire, the part of our bodies nearest to it is liable to be roasted, whilst our back feels freezing, so that we are obliged, when 'one side has lost its genial heat, to turn about and give the chilly side to the fire.' No invention has as yet enabled us to preserve a uniform and genial artificial climate in every part of our dwellings—an art in which even the Romans excelled us. Yet this is the age of ingenuity and luxury.

SOPHIA OF WOLFENBUTTEL.*

CAROLINA CHRISTINA SOPHIA of Wolfenbuttel, sister of the wife of the emperor Charles VI., was united in marriage to the Prince Alexis, son and presumptive heir of Peter the Great, czar of Muscovy. In her were mingled the fairest gifts of nature and education: lovely, graceful, with a penetrating and cultivated mind, and a soul tempered and governed by virtue; yet with all these rare gifts, which softened and won every other heart, she was nevertheless an object of aversion to Alexis, the most brutal of mankind. More than once the unfortunate wife was indebted for her life to the use of antidotes to counteract the insidious poisons administered to her by her husband. At length the barbarity of the prince arrived at its climax: by an inhuman blow, he reduced her to so wretched a state, that she was left for dead. He himself fully believed that which he so ardently desired, and tranquilly departed for one of his villas, calmly ordering the funeral rites to be duly celebrated.

But the days of the unfortunate princess were not yet

terminated. Under the devoted care of the countess of Konigsmark, her lady of honour, who had been present at the horrible event, she slowly regained health and strength, while her fictitious obsequies were magnificently performed and honoured throughout Muscovy, and nearly all the European courts assumed mourning for the departed princess. This wise and noble countess of Konigsmark, renowned as the mother of the brave marshal of Saxony, perceived that, by not seconding the fortunate deceit of the Prince Alexis, and the nation in general, and by proclaiming her recovery, the unhappy Princess Carolina, already the sport of such cruel fate, would expose herself to perish sooner or later by a more certain blow. She therefore persuaded her wretched mistress, who had scarcely strength to undertake the journey, to seek refuge in Paris, under the escort of an old man, a German domestic. Having collected as much money and jewellery as she was able, the princess set out, with her faithful servant, who remained with her in the character of father, which he sustained during his life; and truly he possessed the feelings and tenderness, as well as the semblance, of a parent.

The tumult and noise of Paris, however, rendered it a place of sojourn ill adapted to the mind of Carolina, and to her desire of concealment. Her small establishment having been increased by a single maid-servant, she accordingly embarked for Louisiana, where the French, who were then in possession of this lovely portion of South America, had formed extensive colonies. Scarcely was the young and beautiful stranger arrived at New Orleans, than she attracted the attention of every one. There was in that place a young man, named Moldask, who held an office in the colony; he had travelled much in Russia, and believed that he recognised the fair stranger; but he knew not how to persuade himself that the daughter-in-law of the Czar Peter could in reality be reduced to so lowly a condition, and he dared not betray to any one his suspicions of her identity. He offered his friendship and assistance to her supposed father; and soon his attentive and pleasing manners rendered him so acceptable to both, that a mutual intimacy induced them to join their fortunes, and establish themselves in the same habitation.

It was not long before the news of the death of Alexis reached them through the public journals. Then Moldask could no longer conceal his doubts of the true condition of Carolina, and finding that he was not deceived, he offered with respectful generosity to abandon his pursuits, and to sacrifice his private fortune, that he might reconduct her to Moscow. But the princess, whose bitterest moments had been there passed, preferred, after her adventurous flight, to live far from the dazzling splendour of the court in tranquillity and honourable obscurity. She thanked the noble-hearted Moldask; but implored him, instead of such splendid offers, to preserve her secret inviolable, so that nothing might trouble her present felicity. He promised, and he kept his promise: his heart ardently desired her happiness, in which his own felicity was involved. Living under the same roof, in daily communion, their equal age and ardent feelings kindled in the young man's soul a livelier flame than mere friendship; but respect controlled it, and he concealed his love in his own bosom.

At length the old domestic, who, in the character of father, had shielded the princess, died, and was followed to the tomb by the sincere grief of his grateful mistress—a just recompense for such fidelity. Propriety forbade that Moldask and Carolina should inhabit together the same dwelling after this event. He loved her truly, but loved her good fame more, and explained to her, not without grief, that it was necessary he should seek another abode, unless she, who had already renounced all thought of pride and rank, were content to assume a name dearer and more sacred still than that of friend. He gave her no reason to doubt that vanity, instead of love, was the origin of this pro-

* This extraordinary, but, we believe, true story, is translated from the *Novelle Meravigliose* of Francesco Soave.

posal, since the princess herself was firm in her desire to remain happy in private life. With all delicacy he sought to assure her that he could not but remember, in case of a refusal, that it was scarcely undeserved. Nor could he ever forget how much was exacted from him, by the almost regal birth of her to whose hand he thus dared aspire.

Love, and her desolate and defenceless condition, induced the princess willingly to consent; and, in constituting his felicity, she increased her own. Heaven blessed so happy a union; and in due time an infant bound still closer the marriage tie. Thus the Princess Carolina, born of noble blood, destined to enjoy grandeur, homage, even a throne, having abandoned the magnificence of her former state, in private life fulfilled all the duties of nature and of society.

Years passed happily on, until Moldask was attacked with disease, which required the aid of a skilful surgeon. Carolina was unwilling to confide a life so precious and beloved to the care of surgeons of doubtful skill, and therefore resolved to visit Paris. She persuaded her husband to sell all their possessions, and to embark. The winds were propitious to this pilgrimage; and the medical skill of Paris restored Moldask to health. Being now perfectly cured, the husband sought to obtain employment on the island of Bourbon; and was successful.

Meanwhile, the wife was one day walking with her graceful little girl in a public garden, as was her wont. She sat down on a green bank, and conversed with her child in German, when the marshal of Saxony passing by, was struck with the German accent, and stayed to observe them. She recognised him immediately, and, fearing the same from him, bent her eyes to the ground. Her blushes and confusion convinced the marshal that he was not mistaken; and he cried out, 'How, madame? What do I see? Is it possible?' Carolina suffered him not to proceed, but drawing him aside, she declared herself, praying him to keep sacred the needful secret, and to return with her to her dwelling, where she might with greater care and security explain her situation. The marshal was faithful to his promise; visited the princess many times, though with all due precaution, and heard and admired her history. He wished to inform the king of France, that this august lady might be restored to her rightful honours and rank, and that he himself might thus complete the good work begun by his mother the countess of Konigsmark. But Carolina wished neither to consent, nor openly to oppose his generous design. She asked him to defer his project, until certain plans now pending were accomplished, the termination of which could not be long delayed. Thus she, too happy in being united to a wise and virtuous consort, and contented to live in happy obscurity, kept the marquis at bay.

Near the end of the specified time he again visited her, and learned that, two days previous, she had departed with her husband for the isle of Bourbon. He quickly informed the king of all, who gave orders, through the governor of the island, that Moldask and his wife should be treated with the greatest consideration. Afterward he treated with the Empress Maria Theresa in what way her august aunt should be restored to the splendour due to her rank. The haughty wife, and mother of the czar, knew how to please the most Christian king, and not less generously sent letters to Carolina, in which she invited her to Vienna, promising to overwhelm her with distinctions. But Carolina, foreseeing that a return to her pristine rank at this regal court would debar her from fulfilling the sweet duties of wife and mother, in which all her felicity consisted, refused this offer courageously, but without haughtiness. 'I am so used,' she said to the officer who proposed to reconduct her to the court—'I am so used to this domestic and private life, that I will never change it. Neither to be near a throne, nor to receive the greatest homage, nor to enjoy riches, nor even to possess the universe, would give me the shadow of the pleasure and delight I feel at this moment.' So

saying, she tenderly embraced the one and the other of her dear family.

She lived long with her husband and daughter, serene and contented, dividing her cares and occupations between assisting and amusing the one, and educating the mind and heart of the other. Death snatched from her, within a short interval, these two beloved ones, who had filled her heart with such sweet emotions; and for a long time that heart was a prey to one only sentiment of the deepest grief. Yet not even this sorrow affected her so much, but that she believed the unhappiness of grandeur to be still greater. She constantly refused the repeated invitations to Vienna; and, accepting only a small pension from the liberality of the empress, she retired to Vitry, near Paris, where she wished still to pass under the name of Madame Moldask; but it was impossible longer to conceal her high birth and illustrious ancestry. Notwithstanding this, she never abandoned her accustomed simplicity and retirement of life, in which alone she had begun to find, and found to the last, true felicity.

THE ADVENTURES OF A HOUSE.

A house being usually a fixed object, it may be difficult at first to understand how it should be capable of adventures. Some, indeed, have wings, and might therefore be supposed to have volatile propensities. We talk also of the foot of the stairs. But these are mere phrases, you will say. I grant that a house may be *stable* to all intents and purposes except one, and yet somehow it does not seem to me impossible that it may have its adventures. Cutting short discussion, let me endeavour to bring you to my views by an instance.

The subject of this memoir is a small villa, of which I have a full view from my study window. It is situated in the parish of Podginton, at a convenient distance from London, and belongs to Mr George Burroughs, the eminent wholesale druggist of Camomile Street. It is built at the foot of the hill upon which my own house stands, and was, I must confess, always an eyesore to me; though its owner ever regarded it, I have reason to believe, as one of the most tasteful and elegant structures within twenty miles of the metropolis. When I have described it as it appeared before its adventures began, the reader shall judge whether I am justified in my dislike for the house, or whether Mr Burroughs is to be commended for his taste. It was a square building of faced brick, with a sloping roof of slate. Though it had been built for more than seven years, its glaring newness of outer coating made it a most offensive object in the landscape. The bricks were stuccoed over to imitate stone; and the proprietor had it punctually 'pointed' (as masons call it) every spring, lest it should seem to beholders spoiled and dirty. The style of architecture was of that miscellaneous nature which the learned call composite. When the end of the house happened first to meet your view, you would have pronounced it Gothic, from the pointed arch over the solitary window, and the three tufted towers which started stiffly up from the top and two ends of the roof. The chimneys were florid Tudor of party-coloured bricks. Before the principal entrance was an uncommonly white flight of steps, adorned on each side with a couple of Grecian figures in plaster of Paris. The great dining-room window was an Elizabethan bow.

The lawn was of the finest turf, and kept in such trim order, that I noticed in fine weather the housemaid swept it every morning, as if it were a carpet. The garden walls were of fine red brick, interlined with streaks of mortar dazzlingly white, and against them fruit trees were nailed with the most formal neatness. It was evident that the character of the owner was that of a rich, rigid, discipline-enforcing, ease-loving citizen, with a taste for architecture and landscape-gardening by no means refined.

It was, I think, as near as possible this time two

years that the first inking of adventure took place. I was looking abstractedly at the landscape, being in the agonies of a very difficult sentence which I could not arrange to my satisfaction, when a couple of men made their appearance, and descended the hill towards the house, which, I ought to say was named, in compliment to the street in which Mr Burroughs had made his fortune, 'Camomile Villa.' One of the men was dressed in a velvet shooting-jacket, and carried a small brass telescope, while his attendant's burthen showed me at once that he was a surveyor. The latter bore in his hand two or three staves, with small flags at the end; and on his shoulder, that instrument of torture to conservative country gentlemen, called a theodolite. I augured from this that the doubts, and hopes, and fears which had agitated the parish for the last six months were to be set at rest, and that the eastern branch of the southern railroad was really to pass through Podgionton. The surveyor was not long in commencing operations. He planted his flag directly opposite one corner of the Camomile Villa garden, and, after a few telescopic movements, went up to the house and knocked at the door, with a view, as I supposed, of asking permission to enter the grounds. Presently out came Burroughs without his hat, evidently in a terrible passion; now striding about, now pointing to his garden-wall, then at the flag in the field, and finally concluding by retreating back into the villa, and shutting the door in the intruder's face. However, the man had a duty to perform, and did it. He coolly went into the garden by a side gate, and having called to his man, they knocked out a few bricks so as to make a couple of peep holes through each opposite wall. Having taken the necessary levels, they proceeded to an adjoining meadow, and were soon out of sight. This was the first adventure.

The second took place about a fortnight afterwards. On getting up one morning, I found a host of excavators digging the ground within fifty yards of Camomile Villa, and carting the earth against its garden-wall. Again Mr Burroughs appeared without his hat, and began gesticulating to, and stamping at the workmen, who went on shovelling away without taking the smallest notice of his complaints. In explanation of these violent gestures, I learned from a neighbour that Burroughs and the railway company were at open war: but it was manifest from what was going on, that the latter were getting much the best of the contest. It had been decided that Camomile Villa was to be razed, in terms of the act of parliament in the case of that railway specially made and provided. Mr Burroughs, on the other hand, had determined that his house should not be pulled down, and thereupon the parties joined issue. Burroughs declared that he would remain in his 'villa' while one brick stood upon another, and indignantly refused compensation for its destruction. But it was evident to me, a casual disinterested looker-on, that poor Burroughs would be turned out of house and hold in the end. In fact, the next morning the work of demolition began. The sharpest, acutest, and best 'pointed' corner of his garden-wall was actually pulled down in spite of threats and remonstrances; and an entire tulip-bed was destroyed by the first layers of a huge embankment which was to fill up the hollow in which the house stood. 'Surely,' I said to my wife, 'the man will not be mad enough to continue to live in the house after so significant a notice to quit?'

But he did; although every day a huge piece was nibbled away from the garden walls, and fresh heaps of earth piled upon the flower-beds, till some of the crumbs of the miniature mountain must have actually intruded themselves into the kitchen window. The rooms on the ground floor were evidently darkened by the mass; for, on passing the villa one day, I saw Mr Burroughs dining by candle-light during a hot sunshine. Still there he was; although the house which contained him could stand another week only by a miracle, for the line of

the embankment would—when completed—actually cut off one end of the building.

That week passed away; the works went on; a new and most disastrous adventure had befallen the devoted house; yet it was still its owner's castle, for in it he continued to reside. One morning, Mr Burroughs was awakened by a thundering noise at the fore door, as if it were being fired at by a company of fusileers. Presently there was a grand crash, and the noise intruded itself into the hall. The obstinate inhabitant got up, and found his passage filled with earth, brick-bats, and rubbish. The truth was, the embankment had been, during the morning's work, widened so as to cover the nice clean door-steps; and, by pressure against the door, had burst it open, and forced its way into Camomile Villa; though not, as I have said, without first knocking very loudly, as each truck of earth was unloaded against it. 'Never mind!' exclaimed the stoic to the contractor, whom he hailed out of a first-floor window; 'the back door is still open to me!'

This contractor was evidently a very good sort of man, and a humorist; for I asked him one day why he did not pull down the house at once without further ceremony. 'Pull it down!' he repeated laughing; 'why, I would not do such a thing for the world, till needs must. It is not much in the way as yet, and I love to see the old fellow hold out as he does. Why, all his servants have left, except an old crone, who cannot get another place, and she lives in nightly terror of being swallowed up in an earthquake. However,' he continued, looking towards the Gothic window, 'I must take a shaving off this corner of the house to-morrow, for the embankment is to be completed in a fortnight.'

Sure enough, a day or two afterwards, the threatened 'shaving' was taken off. It consisted of a great portion of the Gothic end, with a small strip of the front wall. This adventure was decidedly the most serious which had befallen the house, and its effects were strangely grotesque. One bedroom, with its furniture properly arranged for a comfortable night's rest, was, by the removal of the walls, completely exposed to the public gaze, and to the sport of the elements. I could plainly discern with the naked eye, from my study window, the washing-stand and ewer flanked by a couple of clean towels on an airing horse. The glazed earthenware glistened in the sun, and the bed curtains sported about in the wind. What had become of the toilet table, on which Burroughs's shaving and dressing tackle was wont, I had been told, to be ostentatiously arranged, the rough 'navigators' who pulled down the wall against which it stood could only tell. It is certain that one of these burly operatives was seen some days after scraping his shovel with an ivory-handled boot-hook, while another was caught in the act of greasing his wheelbarrow out of a pot of *pommade divine*. What the delvers had spared in the devoted bedroom, the wind destroyed. I was witness myself to its causing the bed-curtain sweep the adjacent mantel shelf of its profusion of ornaments, the whole of which fell with a crash upon the floor. About the middle of the day it rained; new disasters were the consequence. The carpet changed colour, the mahogany drawers lost their polish, and the mirror was speckled all over like a frosted scene in a fairy drama. The bed was soon so completely soaked, that it became admirably adapted for an invalid experimenting in the cold water cure.

The general aspect of the room, seen as it was from such an unusual point of view, was curious. Never before had the privacies of the domestic hearth been revealed by means of such a section. I tried to compare it with the descriptions in 'The Devil on Two Sticks'; but the comparison failed; for Asmodeus showed Don Cleophas what was going on within doors by lifting off the roofs. He exhibited a bird's-eye view of private life; mine was a view from its side-scenes.

But did the residence of the sturdy citizen survive this heavy blow? It did; and he continued to hold his own

at the other end of the house, to all appearance 'a prosperous gentleman,' which indeed he was, in more senses than one. The proverb says, 'When things come to the worst they will mend;' and so it happened to him and his house. This destruction of one of its sides was the crisis, for a gleam of prosperity now began to dawn.

A few days after the exposure of the bedroom to the vulgar gaze of the parishioners of Podginton, the works of the railway were stopped. There was something wrong at head-quarters; either the engineer was at fault, or the treasurer had gone away to see how the railways got on in America, or Mr Burroughs had succeeded in his litigations; for I forgot to mention that he had brought some eighteen or twenty actions respectively against the directors, surveyors, engineers, contractors, and excavators of the company, on various pleas, and for the recovery of divers amounts of damages. These actions were either for assault and battery—a shovelful of dirt having been somehow thrown over him on one occasion, while he was haranguing the labourers from his door-step—or for trespass and defamation of character, one of the clerks of works having given out that he was mad. At all events, from whatever cause, the works were suddenly put to a stand-still, and remained exactly in the same state as they were left when the men went away on the night of the cessation. The hall of Camomile Villa was still choked up with dirt; the bed-curtains still wanted amidst the furniture: the end of the carpet, which hung over the hole in the floor, where it had joined the departed wall, still flapped about in the breeze.

I was looking out of my window about this time, when I saw—"could it be a dream?"—an extensive company of bricklayers busily employed in rebuilding the ruined gable of the house, and once more enclosing the exposed dormitory. To be quite certain that this was no optical illusion, I went out to inspect this extraordinary proceeding. I was not mistaken. The new wall had already half hidden from view the housekeeper's room on the ground-floor. On extending my survey to the front of the house, I was forcibly reminded of the celebrated Mrs Partington, who endeavoured to oppose the progress of the encroaching Atlantic from her parlour with a mop; for some men were engaged in excavating the choked-up hall, and penetrating into the base of the embankment to dig out the steps; though as fast as one step was brought to light, its next neighbour got re-engulfed. I could not understand the meaning of all this; but at length learnt that Mr Burroughs had met with a temporary success in his lawsuit against the directors, and was rebuilding on the strength of it. He was only waiting, I understood, to receive the amount of the swinging damages he expected to recover, to undo all which had been done, and to restore Camomile Villa to its original amenity.

Thus, then, despite the imminent dangers to which the house had been subjected, it still remained firm on its foundations; and although hardly in such good condition as at first, was in a fair way of recovery. The repairs were completed in a short time, and, in spite of the embankment before the front windows, his family and servants returned, and Burroughs was left in quiet and triumphant possession of his much-loved 'villa.'

The winter came on: and although the druggist had hitherto invariably left his country residence to spend his time in his town-house at that season, yet on the present occasion he altered his plans. To have, as he said, 'beaten the railway company,' was a glorious achievement, and he was determined to live and die in his beloved cottage ornée, in commemoration of the fact. It must be owned, however, that it was a poor monument of his perseverance. Its recovery from the loss of its side left it in a very unsightly condition. The quite new and very white gable contrasted unpleasantly with the huge ugly long brown mound of earth, the removal of which was found a much more difficult process than its deposition. Then the other walls were spattered with clay; and the most industrious housemaid and the

whitest Bath-stone were unequal to keeping the door-steps in that snow-like purity which they used to exhibit; for the rain constantly brought down a detritus of dirty rubbish to dim their lustre. Still, in spite of all, the house had come out of its troubles with surprising stamina, and promised to last quite as long as its owner.

Months went by: the winter set in severely, and nothing happened to the house; in which a merry Christmas was spent by the Burroughses. But, alas! such is the uncertainty of railway speculations, and of the law, that whoever or whatever is so much under their influence as Camomile Villa happened to be, cannot rest long undisturbed. The shareholders had settled their squabbles, and the lord chief justice of the common pleas had, with the full concurrence of twelve jurymen, finally decided against Mr Burroughs's claim for damages. As I laid down the newspaper containing this news, I exclaimed to my wife 'Surely Camomile Villa cannot last much longer now.'

A few days more, and my conjecture seemed in full course of fulfilment. The works of the line were resumed with more vigour than ever; all that part of the embankment which Burroughs had been months in removing, was replaced in one morning, and his family and servants were once more obliged to make use of the back door in their escape to London. But the head of the establishment, despite the heavy discouragements he had received, was still inflexibly determined to remain master of his own house, and to keep possession, in spite of law, railway contractors, and blocked-up doors and windows. Like a second Rienzi, he would cling with a despairing firmness even to the ruins of his capitol.

The workpeople soon gave him an opportunity of indulging in this piece of Romanesque heroism; for the next adventure which befell the house was the removal of its roof, an operation which was adroitly performed on one of the frostiest mornings of the season. How long after this the druggist held out I never heard; but this I know, that a week later, a couple of wagons passed our road laden with the villa furniture. I could not help being affected by the sight, as the carts wound slowly up the hill. It looked like a funeral procession, headed by Burroughs in his buggy, who seemed to act as chief mourner; then came the old housekeeper in cloak and hood, walking silently and sorrowfully, and looking for all the world like a mute. The furniture came next. Peace to Burroughs's mahogany! I trust it has found a less mutable asylum than that which it left.

Of course it was ridiculous giving myself any more thought about the house, for its doom was evidently sealed. The repaired Gothic side soon disappeared, and it was not likely that, by the end of a week, one brick would be left standing on another. Consequently, I seldom removed myself from my study fire to look out of my window in that direction. When, therefore, I once more turned my eyes that way, I expected to find that Camomile Villa's last adventure had been consummated, and that it was swept from the face of the parish; but conceive my astonishment when I beheld, instead, a company of slaters replacing the roof! The tenacity of existence which this house showed was really marvellous. No effort of destruction seemed capable of turning it into a ruin. Its roof, like the heads of Hydra, was no sooner taken off than it reappeared. Well had it been named 'Camomile' Villa; for, like that obstinate flower, the more despitely it was used, the more it prospered.

In course of time the railway was finished; yet, though hardly credible, it is nevertheless true that, despite all its adventures, a part of the house still stands where it did! The roof replaced, and the ugly Gothic side removed, it was turned into the Podginton station; the drawing-room—now level with the rails—being a ticket-office. I have only one other adventure to record. Last Thursday night a locomotive ran away with a luggage train, and got off the line just in time

to take a second 'shaving' off the front entrance. At this moment workmen are busily repairing the damage; which was not so great as might have been expected.

Thus end for the present the adventures of the house—for of course you will acknowledge that the phrase is applicable. The career of Camomile Villa may not even yet be closed. But let us hope that, having taken its stand as a decent railway station, it may rest in peace for some years to come.

BIOGRAPHIC SKETCHES.

DR EDWARD JENNER.

THIS celebrated man, the discoverer of the art of vaccination, was born in the vicarage of Berkeley, in Gloucestershire, on the 17th of May 1749. He was the third son of the vicar, and his mother was descended from an ancient and respectable family in the neighbourhood. Losing his father at an early age, he was indebted for his education to the care and solicitude of an elder brother. Young Jenner chose the profession of medicine, and after acquiring the elements of the art at Sodbury, near Bristol, he went to London, and became a pupil and inmate of the celebrated John Hunter. From this enthusiastic and successful cultivator of the science of life Jenner caught the true art of philosophic investigation. They instantly became friends, and this friendship continued during life. Having finished his preliminary studies, he now returned to his native village to practise his profession. Other offers were then and subsequently held out to him, but his love of the country made him proof against them all. He was indeed a true lover of nature. With an inquiring and ever active mind, which prompted him to the investigation of nature's works, he had also that deep feeling of the beautiful and fair which accompanies a poetic temperament. His professional journeys through the district were lightened and diversified by scientific pursuits, and many of his leisure hours devoted to discoveries in natural history. His remarks on the singular and anomalous habits of the cuckoo excited the attention of the members of the Royal Society, and found a place in their printed transactions.

But one subject took possession of his mind, and engrossed his chief attention even from his earliest youth. In the great dairy county of Gloucestershire, where his inclination, and, it may be said, his destiny had placed him for a great purpose, it was a prevalent opinion that a disease was communicated from the teats of the cows to the hands of their milkers, by which the latter were ever afterwards protected from small-pox. While Jenner was a student at Sodbury, a young country woman came to seek advice. The subject of small-pox was mentioned in her presence: she immediately observed, 'I cannot take that disease, for I have had cow-pox.' This incident rivetted the attention of Jenner, and the impression then made took full possession of his mind, and was never effaced. He communicated his views some time afterwards to John Hunter, who, although he had not turned his mind to the subject, was far from stifling any inquiry of the kind, and who, in his characteristic way, replied to the young philosopher, 'Don't think, but try; be patient, be accurate.' From his professional friends in the country, however, his theory met with nothing but discouragement: they, too, as well as Jenner, had heard the vulgar reports of the country people; but the circumstance was so out of the common routine, that they gave it no credit, and never thought of putting it to the test of experiment. In vain did Jenner urge on the discussion of the subject at their professional meetings—they refused to listen, and even laughed him to scorn. But Jenner, though he was thus compelled to fall back upon his own solitary thoughts, was not the character thus to be persuaded from his pursuit; like every man destined to achieve great things, he was firm of purpose. For twenty years he brooded over the subject, collected facts, and made experiments; till at last,

being fully convinced in his own mind that he had compassed the whole bearings of the subject, he came to the resolution of presenting the great discovery as a gift to mankind. The conclusions to which he arrived were as follows:—

The disease called *variola*, or small-pox, is common to man, and to several of our domestic animals, as the cow, horse, goat, &c.; but while in man it presents a severe and virulent disease, in passing through the system of brutes it becomes a mild and innocent affection.

The heels of horses are often affected with this disease, which, though frequently accompanied by what is called grease, is not identical with this latter. If a portion of the matter from the *vesicles* or little blisters on the heel of the horse be taken and applied to the nipples of the cow, the peculiar disease is communicated to the cow; or, on the other hand, the horse may be infected from the cow. Matter taken from the vesicle of the horse or the cow, and inserted below the skin of the human subject, produces there a similar vesicle of a peculiar nature, which, running its course, protects the individual from an attack of the small-pox.

In order to insure complete success in this operation, certain cautions are necessary. The lymph must be taken before the expiry of a certain number of days, and the person to be vaccinated must be free from any other disease of the skin. Unless these conditions are attended to, a true vaccine disease will not be produced, and consequently no protection will follow.

In the true small-pox, it is a well-ascertained fact, that occasionally there are cases where persons who have gone through the disease regularly have again been seized with a second attack.

The same thing holds true with cow-pox. Although the great majority of those vaccinated are for ever afterwards protected from the disease, yet cases occur where, after vaccination, an attack of small-pox has followed.

Vaccination, then, though not an absolute and universal protection, is as much so as small-pox is from a second attack of the same; with this important recommendation, that it substitutes a mild and harmless affection, or rather, it may be called, a remedy, for a violent and dangerous disease.

Even in those rare cases where small-pox occurs after the most careful vaccination, the disease is always mitigated, and very rarely proves fatal.

Such are briefly the conclusions to which Jenner had arrived at this early period of his investigations; and as a proof of his superior sagacity and accuracy of observation, it may be stated that little more has ever been added to his great discovery, and that subsequent experience has only illustrated the truth of his opinions and the efficacy of his practice.

The first 'Inquiry into the Nature of Cow-Pox,' published by Jenner, was a calm, philosophical, and extremely modest statement of his discoveries; and perhaps on this account it was received with the greater favour by the reflecting portion of the public. Some writers have hinted that he too sanguinely maintained the efficacy of cow-pox, and its future power of totally extirpating small-pox. Some degree of enthusiasm might be pardoned in the original discoverer of such a remedy; but on candidly comparing Jenner's conclusion with the facts which have subsequently occurred, there seems nothing overstrained, and little that can be deducted from his statements.

In the spring of 1780, while riding in company with one of his earliest and dearest friends, his mind being full of the subject, he ventured to unbosom himself of his cherished hopes and anticipations; and after a detail of his opinions—'Gardner,' said he, 'I have intrusted a most important matter to you, which I firmly believe will prove of essential benefit to the human race. I know you, and should not wish what I have stated to be brought into conversation; for should anything untoward turn up in my experiments, I should be made,

particularly by my medical brethren, the subject of ridicule, for I am the mark they all shoot at.'

It was not, however, till 1796, on the 14th day of May, that the first attempt was made to convey, by artificial means, the vaccine virus from one person to another. On that day Jenner took some matter from the hand of Sarah Nelones, who had been infected by her master's cows, and inserted it by two slight scratches of a lancet into the arms of James Phipps, a healthy boy of eight years of age. The disease took effect, and went through its stages in the most regular and satisfactory manner. But now the most agitating part of the experiment remained: it was necessary to ascertain whether this boy was secured from the infection of small-pox. In the following July, variolous matter was carefully inserted into his skin by various incisions, and to the delight and satisfaction of Jenner no disease followed—the protection was complete. He now pursued his experiments with redoubled ardour: the goal of all his ardent hopes was seen close at hand. It was his custom at this time to meditate much as he rambled in the meadows under the castle of Berkeley. He has left us a picture of his feelings at this period full of interest:—'While the vaccine discovery was progressive, the joy I felt at the prospect before me of being the instrument destined to take away from the world one of its greatest calamities, blended with the fond hope of enjoying independence and domestic peace and happiness, was often so excessive, that, in pursuing my favourite subject among the meadows, I have sometimes found myself in a kind of reverie. It is pleasant to me to recollect that these reflections always ended in devout acknowledgments to that Being from whom this and all other mercies flow.*'

It was in 1798 that Jenner's discovery was first published. His intention was, that it should have appeared in the Transactions of the Royal Society; but the subject was so strange, so novel, and, withal, so improbable, that some of the learned members hinted in a friendly manner that he should be cautious not to diminish, by any other doubtful discovery, the partial fame which his account of the cuckoo had already gained him. Such facts as these impart some idea of the difficulties his discovery was doomed to encounter. On the publication of his 'Inquiry,' he proceeded to London in person, in order to exhibit to the profession there his process of vaccination, and the success attending it. But—will it be believed?—he remained two months there, and at last returned home without getting any medical man to make trial of it, or any patient to submit voluntarily to the simple and harmless process. That process, which in a few years afterwards millions of individuals eagerly availed themselves of, could not be exhibited, even for a bribe, in a single being. It was only after his return home that Mr Cline, the surgeon, almost clandestinely inserted the matter into a patient, by way of an issue for a diseased joint! Yet it is a wise provision of affairs in this world, that truth will at last and infallibly prevail. The subject of vaccination began to engross public attention; and although many were incredulous, and scoffed at the matter, as is ever the case with what is new and uncommon, yet many, on the other hand, had faith to make trial of it; and finding success attend their experiments, the practice of vaccination extended on all hands. But there never was a discoverer yet who has not in a greater or less degree suffered martyrdom—the ignorant, the envious, the narrow-minded, the purely malicious, for ever hang on the footsteps of the discoverer, irritating and obstructing his progress, and raising a clamour in which they hope the sober and subdued voice of truth will be drowned. Poor Jenner passed many harassing days and sleepless nights, less fearful about the wreck of his own honest fame, than for the success of his great and darling project. He had to answer every blunderer, who, in spite of the plainest directions, was sure always to go wrong in the most essential

points—every failure of every careless experimenter was laid to his door—he was caricatured as a magician, who by and by would turn the human race into cows; and, baser than all, some of those who at one time scoffed at his theories, and despised his attempts to put them into practice, now endeavoured to avert the discovery from Jenner entirely, if not to appropriate it to themselves. Yet time and circumstances, and his own tact and perseverance, seconded by his unyielding confidence in his opinions, brought him many friends and supporters. 'The drop of pearl upon a rose-bud,' as he poetically described the vaccine vesicle to the great statesman Fox, was such a simple, and easy, and beautiful substitute for the loathsome and dreaded blotches of small-pox, that the public at large, and more particularly the female part of it, became the warm and active propagators of the limpid virus. From Britain the practice extended rapidly to the continent. In America, the early cases were most successful: and at last the remotest countries in the world began to share its benefits, till there was not a corner of the peopled globe where the name of Jenner did not become familiar, and where his life-preserving process was not eagerly adopted. Among the many honours and acknowledgments which now and afterwards continued to be poured in upon him, not the least interesting was a document from a race of the North American Indians, authenticated by the symbolical signatures of their chiefs.

The discovery of vaccination now evidently appeared as a manifest boon to mankind. In several countries on the continent of Europe, where the nature of the government allowed of a free control over the habits of the people, the practice of vaccination was so systematically pursued, that small-pox was almost entirely eradicated. In the British navy and army, under a similar surveillance, small-pox was also unknown; but though in the British dominions several vaccinating boards were instituted, yet from the habits of the people, and the absence of a compulsory law, vaccination was not there, and never yet has been, so complete and universal as to banish entirely the lurking malady of small-pox from our shores.

Considering, however, what devotion Jenner had bestowed on the subject, both theoretically and practically; considering the generous and disinterested manner in which, the moment that he became acquainted with its perfect efficacy, he hastened to lay his discovery before the world, his claim to a national compensation and reward could no longer be denied. In 1802 a committee of parliament was appointed to investigate his discovery, and decide on a remuneration. Of the many claimants on national bounty, few ever came forward with better pretensions than Jenner. Yet much caution was employed; and, in the first instance, a grant of only £10,000 was voted, subject to the delays and deductions of fees with which such grants are too often encumbered. This, as Jenner and his friends affirmed, was barely equal to the expenses he incurred, considering his multifarious correspondence, as well as his relinquishment of private practice, and the actual toil of responding to the querists from every region of the globe. Yet it is not to be wondered at if parliament had a wary suspicion of the reports of cures of any kind; for who does not hear of wonderful cures accomplished every day, and well-authenticated also, and yet experience, or further inquiry, proves them all ultimately fallacious; nor could it be forgotten that half a century had not elapsed since the same parliament voted its thousands for a nostrum which was utterly worthless. Happily for the fame of the legislature, however, and for the honour of the country in all future times, in the present instance it judged aright: even its caution was commendable: and allowing an interval of five more years, a further grant of £30,000 redeemed their sense of the progressive importance and continued efficacy of the vaccine discovery. In the meantime, Jenner had taken up his residence in London, with a view to the better furtherance of the interests of vaccination, and

with an idea of establishing himself in practice in the metropolis. But his was not a character fitted for the artificial bustle of the vast city, or the jarring conflicts of professional interests; his mind sickened amid the smoke, as one of his own meadow cowslips would have done, and he hastened back to his fields and his pure country air, and never left his beloved village again.

But he did not return to apathy or indolence. In London some finessing on the part of his professional brethren prevented him from acting as director of the national vaccine board, to which he had been in the first instance appointed; but now, in his own words, he retired to be 'Director-General to the World.' In addition to this, the country people from all the districts around flocked to him for the benefits of vaccination, and his time and skill were ever at the service of the poor. He now, too, enjoyed his favourite pursuits of the study of nature, and shared his leisure hours among his fossils, his birds, his flowers, and the society of his family and his friends. Of every man who has achieved great things, we have a desire to know something not only of his thoughts and habits, but of his personal appearance. An early sketch of Jenner is thus given by his friend Gardner.

'His height was rather under the middle size; his person was robust but active, and well formed. In his dress he was peculiarly neat, and everything about him showed the man intent and serious, and well prepared to meet the duties of his calling. When I first saw him, it was on Frampton Green. I was somewhat his junior in years, and had heard so much of Jenner of Berkeley, that I had no small curiosity to see him. He was dressed in a blue coat and yellow buttons, buckskins, well-polished jockey boots, with handsome silver spurs, and he carried a smart whip with a silver handle. His hair, after the fashion of the times, was done up in a club; and he wore a broad-brimmed hat. We were introduced on that occasion, and I was delighted and astonished. I was prepared to find an accomplished man, and all the country spoke of him as a skilful surgeon and a great naturalist; but I did not expect to find him so much at home in other matters. I, who had been spending my time in cultivating my judgment by abstract study, and smit from my childhood with the love of song, had sought my amusement in the rosy fields of imagination, was not less surprised than gratified to find that the ancient affinity between Apollo and Æsculapius was so well maintained in his person.' At a later period, his biographer, Dr Barron, then a young man, thus gives an account of a first interview with him. 'He was living at Fladong's hotel, Oxford Street, in the summer of 1808, making arrangements for the national vaccine establishment. The greatness of his fame, his exalted talents, and the honours heaped upon him by all the most distinguished public bodies of the civilised world, while they made me desirous of offering my tribute of respect to him, forbade the expectation of more than such an acknowledgment as a youth circumstanced as I was might have expected. I soon, however, perceived that I had to do with an individual who did not square his manners by the cold formality of the world. He condescended as to an equal. The restraint and embarrassment that might naturally have been felt in the presence of one so eminent, vanished in an instant. The simple dignity of his aspect, the kind and familiar tone of his language, and the perfect sincerity and good faith manifested in all he said and did, could not fail to win the heart of any one not insensible to such qualities. He was dressed in a blue coat, white waistcoat, and nankeens. All the tables in his apartment were covered with letters and papers on the subject of vaccination. He spoke with great good humour of the conduct of the anti-vaccinists, and gave me some pamphlets illustrative of the controversy then carrying on. The day before I saw him, he had had an interview with the Princess of Wales, and he showed me a watch which her royal highness had presented to him on that occasion.' The same friend, at a much later period of their acquaintance,

again remarks—'Dr Jenner's personal appearance to a stranger at first sight was not very striking; but it was impossible to observe him, even for a few moments, without discovering those peculiarities which distinguished him from all others. The first things that a stranger would remark were the gentleness, the simplicity, the artlessness of his manner. There was a total absence of all ostentation or display, so much so, that in the ordinary intercourse of society he appeared as a person who had no claims to notice. He was perfectly unreserved, and free from all guile. He carried his heart and his mind so openly, so undisguisedly, that all might read them. His professional avocations, and the nature of his pursuits, obliged him to conduct his inquiries in a desultory way. At no period of his life could he give himself up to continued or protracted attention to one object: there was, nevertheless, a steadiness in working out his researches amid all the breaks and interruptions which he met with, that can only belong to minds constituted as his was.'

With all the simple and genial qualities of an unsophisticated heart, Jenner had, when the occasion required, all the firmness and dignity becoming a man conscious of the possession of talent. On one occasion, in the drawing-room of St James's, he chanced to overhear a noble lord mention his name, and repeat the idle calumny which had got abroad, that he himself had not really confidence in vaccination. He with much promptitude refuted the charge, and stepping up to the noble lord, to whom he was unknown, calmly observed, 'I am Dr Jenner.' Any unpleasant recollection of this circumstance was most likely, on the part of Jenner, soon dissipated; but not so with the noble statesman; his remarks some time afterwards, in his place in parliament, when Jenner's claims came to be discussed, showed that he had not forgotten it.

When the continental sovereigns visited London in 1814, Jenner was presented to the Emperor Alexander of Russia by his sister, the grand duchess of Oldenburg. In describing this interview, he says, 'I was very graciously received, and was probably the first man who had ever dared to contradict the autocrat. He said, "Dr Jenner, your feelings must be delightful. The consciousness of having so much benefited your race must be a never-failing source of pleasure, and I am happy to think that you have received the thanks, the applause, and the gratitude of the world." I replied to his majesty that my feelings were such as he described, and that I had received the thanks and the applause, but not the gratitude of the world. His face flushed; he said no more; but my daring seemed to give displeasure. In a short time, however, he forgot it, and gave me a trait of character which showed both great goodness of heart and knowledge of human nature. My inquiries respecting disease of the lungs had reached the ears of the grand duchess, the most interesting being that I had ever met with in a station so elevated. She was present, and requested me to tell to her brother, the emperor, what I had formerly said to her imperial highness. In the course of my remarks I became embarrassed. She observed this, and so did the emperor: "Dr Jenner," said she, "you do not tell my brother what you have to say so accurately as you told me." I excused myself by saying that I was not accustomed to speak in such a presence. His majesty grasped me by the hand, and held on for some time, not quitting me till my confidence was restored by this warm-hearted and kind expression of his consideration.'

As his life was an active and benevolent, so, on the whole, may it be termed a prosperous and a comparatively happy one. Latterly, he had domestic afflictions, which to a sensitive heart are the heaviest of sorrows. He lost his favourite son, his newly-married daughter, and at last his amiable wife, whose delicate constitution he had tended with all the assiduity which deep affection and respect could dictate. He reached a good old age, with his general health and mental powers unimpaired to the last. On the 26th January 1823, he died

suddenly of apoplexy, in the 74th year of his age. He lies buried in the chancel of the church at Berkeley, where a monument has been erected to his memory by his professional brethren.

It is now almost half a century since the first introduction of vaccination, and at least forty years since its general adoption—a sufficient time, one would think, to test its efficacy, and yet there are several circumstances relating to it which have not yet been definitely determined. In the first place, it cannot be denied that on the whole it has been a successful remedy, and that it has produced a remarkable effect on the general population. Small-pox, if it has not been entirely eradicated, has been disarmed of most of its terrors; and notwithstanding the cases of failure of protection from its ravages which occasionally occur, yet the general confidence never has been withdrawn from the practice of vaccination.

Both before and since the death of Dr Jenner, it became known that cases sometimes occurred where persons who had been vaccinated were seized with small-pox. At first, it was supposed that those cases were instances where vaccination had not taken proper effect, either from an imperfect quality of the virus used in vaccination, or from a peculiar habit of the person vaccinated. But it was afterwards ascertained that persons in whom the process had been practised with the utmost care, and in whom the disease appeared to go through its course in the most favourable manner, were yet not protected from small-pox. It is true, in all these cases of seizure the affection was of a much milder kind than even the inoculated small-pox, and in a very small proportion indeed did death occur, perhaps not one case in several thousands; yet there could be no doubt but that the disease was in reality true small-pox, under a mild and modified form.

It became evident, then, that there were exceptions to the universal protection against small-pox, and that this disease might occur after vaccination, just as an individual might be seized with a second attack of small-pox. This was a fact known to Dr Jenner even before he gave his discovery to the world. In his early pursuit of the inquiry he was much staggered by it, but further experience enabled him to perceive that it was only an exception to a general rule; and all experience since, both in public vaccine institutions and in private practice, has only tended to confirm it.

Seeing, then, that such exceptions from time to time continued to occur, and as they multiplied in number by time and the general diffusion of vaccination, another question began to be agitated—whether the vaccine matter, by passing through innumerable human beings, had not lost its character and consequent efficacy; and whether it would not be necessary again to have recourse to the cow?

The most experienced vaccinators seem to give no countenance to this opinion. They affirm that the character of the vaccine vesicle is exactly the same, and its development, in all its stages, as regular and complete as it was when first discovered; and that, when compared with vesicles produced by matter directly from the cow, there is no difference; that even in the early stages of the employment of vaccination, failures, as already stated, began to appear; and that these failures are probably not more in proportion now than they were then.

A suggestion of another kind has been advanced—that probably the protection of the vaccine matter is only of a temporary nature, and that it becomes exhausted in the course of time, and thus leaves the constitution open to an attack of small-pox. If this had been the case, then in the course of the last forty-five years all those persons vaccinated should have by this time successively had attacks of small-pox when exposed to infection. This, however, has by no means happened; so that the fact cannot be true as a general rule, though, as we shall afterwards state, it may hold in some respects as regards individuals at different periods of life;

and thus the propriety of a second vaccination about the age when the individual is entering on the period of manhood has been frequently suggested.

Taking all these exceptions into account, there can be no doubt but that the practice of vaccination, with its partial drawbacks, has been an inestimable boon to mankind. It has been ascertained that every fourteenth child born was cut off by small-pox; and that in most cases where adults were infected, a death occurred out of every seven. If to this we add the other fatal diseases called into action by this malady, the influence on the increase of population by the check it has received from vaccination must be held to be very considerable. We accordingly find that, previous to 1780, the annual mortality in England and Wales was rated at one in forty; whereas at the present time it is one in forty-six. No doubt other causes have combined to improve the general health, but that the preventive power of vaccination has been mainly instrumental, appears, even from the diminished deaths from small-pox, sufficiently evident. Indeed we have only to call to mind the scarred and pitted faces, marred features, and opaque and sightless eyeballs of former days, to be convinced of the essential service which has been rendered to the community.

'TALES OF THE COLONIES.'

Eighteen months ago, we noticed a work under the above title, of which it would be difficult to say whether it abounded more in the spirit-stirring scenes usually found in fiction, or in sound views respecting emigration to, and settlement in, perhaps the finest of the Australian colonies—Van Diemen's Land. As to a great extent the adventures of a settler—an English farmer—in that distant colony, who, after undergoing many mishaps, while the country was still in a crude condition, had lived to reap the reward of his perseverance, such a work could not fail to be very generally acceptable; and we are glad to know that it has been so much so as to pass already into a third edition. Desirous of rendering his work more extensively available, the author has judiciously issued it in a single volume; and as a copy of this cheap edition has been placed under our notice, we take leave to bring it once more before our readers.

Having on the former occasion described the contents of the book at considerable length, it is now unnecessary to say more on that subject. Being desirous, however, of conveying an idea of the author's powers of narration, we may offer the following extract, which refers to a state of society in the colony, now, we believe, gone.

THE BUSHRANGER.

In crossing the country one day, and at a distance from any habitation, Mr Thornley, the settler, to his surprise and fear beheld at a short distance approaching him a noted bushranger, known by the name of 'the Gipsy,' who had latterly, with a band of associates, become the dread of the colony. He was a tall well-made man, one apparently above the ordinary character of convicts, and whom it was distressing to see in such a situation. The parties approached each other with mutual distrust. Thornley knew he had a desperate character to deal with, and pointed his gun at him; but the bushranger seemed desirous of a parley, and after a few words, says the writer, 'he laid his gun quietly on the grass, and then passed round me, and sat down at a few yards' distance, so that I was between him and his weapon. "Well, Mr Thornley," said he, "will that do? You see I am now unarmed. I don't ask you to do the same, because I cannot expect you to trust to me; but the truth is, I want to have a little talk with you. I have something on my mind which weighs heavy on

me, and whom to speak to I do not know. I know your character, and that you have never been hard on your government men, as some are. At any rate, speak to some one I must. Are you inclined to listen to me?"

"I was exceedingly moved at this unexpected appeal to me at such a time and in such a place. There was no sound, and no object save ourselves, to disturb the vast solitude of the wilderness. Below us flowed the Clyde, beneath an abrupt precipice; around were undulating hills, almost bare of trees; in the distance towered the snowy mountain which formed the boundary to the landscape. I looked at my companion doubtfully; for I had heard so many stories of the treachery of the bushrangers, that I feared for a moment that this acting might only be a trick to throw me off my guard. Besides, this was the very man whom I knew to have been at the head of the party of bushrangers who had been captured at the Great Lake.

He observed the doubt and hesitation which were expressed in my looks, and pointed to his gun, which was on the other side of me.

"What more can I do," said he, "to convince you that I meditate neither violence nor treachery against you? Indeed, when you know my purpose, you will see that they would defeat my own object."

"What is your purpose, then? Tell me at once—are you one of the late party of bushrangers who have done such mischief in the island?"

"I am: and more than that, I am—or rather was—their leader. I planned the escape from Macquarie harbour; and it was I who kept them together, and made them understand their strength, and how to use it. But that's nothing new. I do not want to talk to you about that. But I tell you who and what I am, that you may see I have no disguise with you; because I have a great favour—a very great favour—to ask of you; and if I can obtain it from you on no other terms, I am almost inclined to say, take me to Camp as your prisoner, and let the capture of the Gipsy—ah! I see you know that name, and the terror it has given to the merciless wretches who pursue me—I say, let the capture of the Gipsy, and his death, if you will—for it must come to that at last—be the price of the favour that I have to beg of you!"

"Speak on, my man," I said; "you have done some ill deeds, but this is not the time to taunt you with them. What do you want of me? and if it is anything that an honest man can do, I promise you beforehand that I will do it."

"You will!—but you do not know it yet. Now listen to me. Perhaps you do not know that I have been in the colony for ten years. I was a lifer. It's bad that; better hang a man at once than punish him for life: there ought to be a prospect of an end to suffering; then the man can look forward to something; he would have hope left. But never mind that. I only speak of it because I believe it was the feeling of despair that first led me wrong, and drove me from bad to worse. Shortly after my landing I was assigned to a very good master. There were not many settlers then, and we did not know so much of the country as we do now. As I was handy in many things, and able to earn money, I soon got my liberty on the old condition; that is, of paying so much a-week to my master. That trick is not played now, but it was then, and by some of the big ones too. However, all I cared for was my liberty, and I was glad enough to get that for seven shillings a-week. But still I was a government prisoner, and that galled me; for I knew I was liable to lose my license at the caprice of my master, and to be called into government employ. Besides, I got acquainted with a young woman, and married her, and then I felt the bitterness of slavery worse than ever; for I was attached to her sincerely, and I could not contemplate the chance of parting from her without pain. So about three years after I had been in this way, I made an attempt to escape with her in a vessel that was sailing for England. It was a mad

scheme, I know; but what will not a man risk for his liberty?"

"What led you to think of going back to England? What were you sent out for?"

"I have no reason to care for telling the truth. I was one of a gang of poachers in Herefordshire, and on a certain night we were surprised by the keepers, and somehow, I don't know how, we came to blows; and the long and the short of it is, one of the keepers was killed; and there's the truth of it."

"And you were tried for the murder?" "I and two others were; and one was hanged, and I and my mate were transported for life." "Well, the less that's said about that the better; now go on with your story; but let me know what it is you would have me do for you."

"I'll come to that presently; but I must tell you something about my story, or you will not understand me. I was discovered in the vessel, concealed among the casks, by the searching party, and brought on shore with my wife; and you know, I suppose, that the punishment is death. But Colonel Davey—he was governor then—let me off: but I was condemned to work in chains in government employ. This was a horrid life, and I determined not to stand it. There were one or two others in the chain-gang all ready for a start into the bush, if they had any one to plan for them. I was always a good one at head-work, and it was not long before I contrived one night to get rid of our fetters. There were three others besides myself. We got on the top of the wall very cleverly, and first one dropped down (it was as dark as pitch, and we could not see what became of him), then another dropped, and then the third. Not a word was spoken. I was the last, and glad enough was I when I felt myself sliding down the rope outside the yard. But I had to grin on the other side of my mouth when I came to the bottom. One of the sneaks whom I had trusted had betrayed us, and I found myself in the arms of two constables, who grasped me tightly. I gave one of them a sickener, and could have easily managed the other, but he gave the alarm, and then lots of others sprang up, and lights and soldiers appeared. I was overpowered by so many. They bound my arms, and then I was tried for the attempt to escape, and the assault on the constable, and condemned to Macquarie harbour for life.

"I have not told you that my wife brought me a child. It is now seven years old. I loved that child, Mr Thornley, more than a parent usually loves his child. It was all in all to me. It was the only bright thing that I had to look upon. When I was sentenced to Macquarie harbour for life, it would have been a mercy to put me to death. I should have put myself to death, if it had not been for the thought of that little girl. Well, sir, I will not say more about that. When a man takes to the bush, and has done what I have done, he is thought to be a monster without feeling or affection. But people don't understand us. There is no man, sir, depend upon it, so bad that he has not some good in him; and I have had some experience: for I have seen the worst of us—the very worst—in the most miserable of all conditions—for that Macquarie harbour is a real hell upon earth! There is no time to tell you about the hardships and the miseries which the prisoners suffer in that horrible place—it soon kills them. But my greatest misery was being deprived of my little girl—my plaything—my darling—my life! I had not been at Macquarie harbour a month, before news came that my wife was dead. I'll tell you the truth, sir: attached to her as I was, I was rather glad than sorry for it. I could not bear the thought of her falling into anybody else's hands; and as our separation was now absolutely and hopelessly for ever—it is the truth—I was rather glad than sorry when I heard of her death. But my poor little child! I thought of her night and day, wondering and thinking what would become of her! I could think of nothing else. At last my thoughts began to turn to the possibility of escaping from Macquarie harbour, desperate as the attempt appeared; for, to cross the bush without arms, and without provisions, exposed to the attacks of the natives, seemed all but an

impossibility. But almost anything may be done by resolution and patience, and watching your opportunity."

[The escape having been effected,] "We scrambled away as well as we could, till we got a little distance off, and out of hearing, and then we set to with a will, and rid ourselves of our fetters, all except three, and these were too tightly fitted to be got off on a sudden without better tools. We got the three chained men along with us, however, as well as we could, for we would not leave them; so we helped them on by turns; and the next day, when we were more easy, we contrived to rid them of their incumbrances. We hastened on all night. I ought to tell you that we heard the bell rung and the alarm given; but we had gained an hour good, and the ungagging of the sentinels and the overseers, and hearing their story, took up some time no doubt. Besides, it is not easy to hit on a track in the dusk, and as there were fourteen of us, armed with two muskets, our pursuers would not proceed so briskly as they otherwise might, and would not scatter themselves to look after us. We were without provisions; but we did not care about that; and not being used to long walks, we were soon knocked up. But the desire of liberty kept us up, and we struck right across the country in as straight a line as we could guess. The second day we were all very sick and faint, and the night before was very cold, and we were cramped and unfit to travel. The second night we all crept into a cave, which was sandy inside, where we lay pretty warm, but we were ravenously hungry. We might have shot more than one kangaroo that day, but it was agreed that we should not fire, lest the report of our gun should betray our resting-place to our pursuers. As we lay huddled together, we heard the opossums squealing in the trees about, and two of us, who were least tired, tried to get some of them. When we climbed up the trees, they sprang away like squirrels, and we had no chance with them that way; besides, it was dark, and we could distinguish them only faintly and obscurely. We did contrive, however, to kill five by pelting them on a long overhanging bough; but they remained suspended by their tails, and did not drop, although dead. To hungry men a dead opossum is something; so one of us contrived to climb to them and get them down; and then we lighted a fire in the cave, quite at the extremity inside, to prevent the flame from being seen, and roasted them as the natives do. They were horrid rank things to eat, and almost made us sick, hungry as we were; but I don't think a hair of them was left among us. The next day we shot a kangaroo; but we feared to light a fire because of the smoke, so we ate it raw.

"We first struck on the outskirts of New Norfolk, and we debated what we should do. Some were for attacking the settlement, and getting arms; but I persuaded them that it would be better for us to endeavour to seize some small vessel, and escape altogether from the colony; and in the meantime to keep ourselves close, and not give any alarm. My companions agreed to this, and we struck across the country to Brighton Plains, and so to Pitt Water, where we expected to find some large boats, or perhaps some small vessel, by means of which we might get away."

"And how was it that you did not follow that plan?"

"We did follow it: we got to Pitt Water, and lay snug there for a while; but we were obliged to rob a settler's house of provisions for food, and that first gave the alarm. We made a dash at a boat, but it was too late; precautions had been taken, and the soldiers were out after us. We were then obliged to retreat from Pitt Water, intending to get into the neighbourhood of the lakes, and go farther westward if necessary, and retreat to the coast, where we judged we should be too far off to be molested."

"You did a great deal of mischief at Pitt Water before you left it, if all the stories are true?"

"We did, Mr Thornley, I own it: but my men were determined to have arms, and the settlers of course re-

sisted, and some of my men got wounded, and that made them savage."

"And afterwards you attacked poor Moss's cottage?"

"My men had been told that he had a large sum in dollars at his hut—I am surprised that settlers can be so foolish as to take valuables into the bush—that was all they wanted."

"But why did you take poor Moss along with you?"

"I was obliged to do it to save his life. Some of my men would have knocked him on the head if I had not prevented them. It's true, Mr Thornley, it is indeed—I saved his life."

"Well, that's something in your favour. And now, as the sun is sinking fast, and as the dusk will come on us presently, tell me at once what you would have me do for you."

"Mr Thornley," said the bushranger, "I have told you of my little girl. I have seen her since the dispersion of my party at the Great Lake. You know that I and another escaped. Since then I have ventured in disguise into Hobart Town itself, and have there seen my child. The sight of her, and her embraces, have produced in me a strange feeling. I would willingly sacrifice my life to do her good; and I cannot conceal from myself that the chances are that I must be taken at last; and that if I do not perish miserably in the bush, I shall be betrayed, and shot or hanged."

"And what can I do to prevent it?"

"You can do nothing to prevent that end, for I know that I am too deep in for it to be pardoned. If I were to give myself up, the government would be obliged to hang me for example's sake. No, no; I know my own condition, and I foresee my own fate. It is not of myself that I am thinking, but of my child. Mr Thornley, will you do this for me—will you do an act of kindness and charity to a wretched man, who has only one thing to care for in this world? I know it is much to ask, and that I ought not to be disappointed if you refuse it. Will you keep an eye on my poor child, and so far as you can, protect her? I cannot ask you to provide for her; but be her protector, and let her little innocent heart know that there is some one in the wide world to whom she may look up for advice—for assistance, perhaps, in difficulty; at all events, for kindness and sympathy: this is my request. Will you have so much compassion on the poor, blasted, and hunted bushranger, as to promise to do for me this act of kindness?"

"I gazed with astonishment, and, I must add, not without visible concern, on the passionate appeal of this desperate man in behalf of his child. I saw he was in earnest: there is no mistaking a man under such circumstances. I rapidly contemplated all the inconveniences of such an awkward charge as a hanged bushranger's orphan. As these thoughts passed through my mind, I caught the eye of the father. There was an expression in it of such utter abandonment of everything but the fate of his little daughter, which seemed to depend on my answer, that I was fairly overcome, and could not refuse him. "I will look after her," I said; "but there must be no more blood on your hands: you must promise me that. She shall be cared for; and now that I have said it, that's enough—I never break my word."

"Enough," said he, "and more than I expected. I thank you for this, Mr Thornley, and could thank you on my knees. But what is that? Look there! A man on horseback, and more on foot. I must be on my guard."

"As he spoke, the horseman galloped swiftly towards us. The men on foot came on in a body, and I perceived they were a party of soldiers. The Gipsy regarded them earnestly for a moment, and then ran to his gun, but in his eagerness he tripped and fell. The horseman, who was one of the constables from Hobart Town, was too quick for him. Before he could recover himself and seize his gun, the horseman was upon him. "Surrender, you desperate villain, or I'll shoot you."

'The Gipsy clutched the horse's bridle, which reared and plunged, throwing the constable from his seat. He was a powerful and active man, and catching hold of the Gipsy in his descent, he grappled with him, and tried to pinion his arms. He failed in this, and a fearful struggle took place between them. "Come on," cried the constable to the soldiers; "let us take him alive."

'The soldiers came on at a run. In the meantime, the constable had got the Gipsy down, and the soldiers were close at hand, when suddenly, and with a convulsive effort, the Gipsy got his arms round the body of his captor, and with desperate efforts rolled himself round and round, with the constable interlaced in his arms, to the edge of the precipice. "For God's sake!" cried the constable with a shriek of agony, "help, help! We shall be over!" But it was too late. The soldiers were in the act of grasping the wretched man's clothes, when the bushranger, with a last convulsive struggle, whirled the body of his antagonist over the dreadful precipice, himself accompanying him in his fall. We gazed over the edge, and beheld the bodies of the two clasped fast together, turning over and over in the air, till they came with a terrible shock to the ground, smashed and lifeless. As the precipice overhung the river, the bodies had not far to roll before they splashed into the water, and we saw them no more.'

The reader may be interested to know that Mr Thornley was better than his word. He sought the daughter of the unfortunate man, took her home to his house, and afterwards sent her to England.

MODEL CHEAP LODGING-HOUSE.

THE lodging-houses resorted to by occasional residents of the humbler classes in large cities, are generally of a wretched kind. The persons who keep them necessarily seek to make a profit on tenants at the rate of about threepence a-night, for which they furnish, besides bed-accommodation, the use of a fire for cooking, and, in some cases, the means of cleaning or blacking shoes. Situated in the meanest neighbourhoods, often wretchedly furnished and ill-kept, unprovided with direct supplies of water, or the conveniences necessary for the preservation of delicacy, these houses are not, in general, either healthy, comfortable, or favourable to the morals of their occupants. It is indeed one of the most affecting of the many forms of hardship incidental to the poor man's life, that it forbids him on many occasions to dispose himself amongst things which are pure and of good report, or which any good taste he may possess would incline him to select. It often happens, we understand, from the indiscriminate manner in which lodgers are received in these houses, that an honest labouring man is robbed between night and morning of the scanty earnings which he had realised at harvest or otherwise, and on which he was depending for the fulfilment of the most important objects when he should have reached his home. Such houses, too, having no regulations against the introduction of liquors, it necessarily follows that the sober are exposed to temptation, or at least to the disgust with which they must unavoidably behold intemperate indulgences.

Not overlooking the fact, that many houses of this kind are managed by decent and well-disposed persons, but believing that the majority are otherwise, and that it is desirable that an example of superior management should be set before them, a society of charitable persons lately resolved to attempt such an establishment in Edinburgh. In the humble street called the West Port, remarkable for the proportion of poor Irish in its population, there is a tall modern tenement, consisting, besides a floor of shops on the level of the street, of one sunk floor and three upper storeys. The whole of this house, exclusive of the shops, was obtained at a rent of twenty-five pounds, and it was immediately furnished in a plain but cleanly and substantial style, each room containing one or more beds, while, in the lower floor, there is a kitchen for general resort and for cooking,

besides a wash-house and scullery. On each floor there is a water-pipe with sink: other needful conveniences are not overlooked. This large mansion was put under the care of a veteran sergeant and his wife—persons of select character—who, with a servant, keep the whole in order.

The Victoria Lodging-house, as it is called, has been in operation since September of last year, and seems likely to thrive. We visited it lately, and found that scarcely a night passes without seeing it nearly full. It is a pattern of cleanliness, and the whole of the arrangements seem to be excellent. At present, the number of lodgers receivable is limited to about thirty-eight; but, finding the number of applicants often exceeding their complement, the managers contemplate furnishing an additional floor, and will then be able to accommodate fully fifty. There may be a curiosity as to the style of the rooms and furniture. The former are plain whitewashed well-lighted apartments, such as those usually devoted to servants in genteel houses: it strikes us that we have occupied inferior rooms in hotels at half-a-crown a-night, when we chanced to be among the last of many arrivals. The chief article of furniture in each is an iron bedstead, provided with a flock-bed, blankets, and sheets. We were particular in turning down the clothes, and were pleasantly surprised to find the article last-mentioned clean and comfortable, albeit of the homeliest texture. The kitchen, or rather hall for general resort, is a comfortable place, provided with a good fire, oven, and boiler for continual hot water. Here the inmates attend to their own cuisine, for it is a rule of the establishment not to go beyond its proper line of offering simple domestic accommodation.

The daily charge for an individual is threepence. For this sum he has the use of a furnished house the whole day, and of a bed at night. Here, moreover, he is sure that discrimination is, as far as possible, exercised with respect to those who are to be his associates, and that he is safe from all connexion with intemperate revels and their tissue of disgusting consequences—for *no liquor can on any account be introduced into the house*. The privilege thus placed within the reach of the poor man we hold to be of infinitely more importance than clean rooms and comfortable furnishings, although these are also to be estimated highly. In particular cases, a group of people connected with each other—as, for instance, a detachment of Highland reapers—are allowed to have a separate room. Last year, such a band actually were accommodated in this manner over a Sunday, and thus were enabled to have scriptural readings and devotions in the language and fashion of the mountains, without troubling or being troubled by others. It is remarkable how much the generality of the inmates are disposed to observe and support the rules of the house. The New Year might have been supposed to be a trying time for these poor people, accustomed as most of them must have been to usher it in with conviviality; but on that occasion not one of the twenty or thirty inmates attempted to introduce a single gill of liquor.

If this establishment were designed, by the employment of charitable funds, to supersede the exertions of poor persons in a humble line of business, who, having to live by their trade, could not pretend to compete with such rivalry, it would not be entitled to public sympathy. But the object of the founders is of no such nature. They aim at making the establishment support itself; in which case—as the salary of the superintendent and his wife would be a profit to a humble couple carrying on the business on their own account—it would be shown that the usual daily outlay of the labouring man for lodging ought to obtain for him, at the hands of private enterprise, better accommodation than at present, with exemption from much that is disgusting and corrupting, as well as immediately dangerous, in such resorts. If the Victoria Lodging-house shall serve as merely a stimulus to the partial improvement of private establishments of the same kind, no one can doubt that it will have done an unequivocal good.

THE MIRROR OF THE DANUBE

BY FRANCES BROWN.

On forests bright with fading leaves,
On hills of misty blue,
And on the gathered gold of sheaves
That by the Danube grew,
The setting sun of autumn shed
A mellow radiance rich and red,
As ever dyed the storied flood,
Since Roman blent with Dacian blood.
But Rome and Dacia both were gone,
Yet the old river still rolled on;
And now upon its sands, apart,
A peasant mother stood,
With beaming eye and bounding heart,
Marking the fearless mood
Of her young children's mirth that rang
Where late the joyous reaper sang.
She blessed each yet unsoftened voice,
Each head of golden hair,
Her rosy girl, her blooming boys,
And their young sire: for there
Was gathered all that meek heart's store—
The earth for her contained no more.
Yet with the love of that long gaze,
Were blent far dreams of future days;
And oh to learn what time's swift wing
To her life's blossoms yet might bring.
Then came a sound like passing wind
O'er the old river's breast,
And that young mother turned to find,
Upon the wave impressed,
The mirrored semblance of a scene
That never on its banks had been.
It seemed a pillared fane that rose
For justice far away,
In some old city at the close
Of a long trial day;
When hope and doubt alike were past,
And bright the midnight torches cast
Their splendour on a breathless crowd,
Dense as the summer's thunder cloud;
E'er the first lightning breaks its gloom,
Waiting the words of death and doom.
But far amid that living sea
Of faces dark and strange,
One visage claimed her memory;
In spite of time and change,
And all that fortune's hand had done,
The mother knew her first-born son.
Sternly he sat in judgment there;
But who were they that stood
Before him at that fatal bar?
Was he—the unsubdued
In heart and eye, though more than age
Had written on his brow's broad page
The fiery thoughts of restless years,
Whose griefs had never fallen in tears;
Unblanched by guilt, untouched by scorn,
Her beautiful, her youngest born,
And he upon whose hair and heart,
Alike had fallen the snows
Of winters that no more depart;
The worn of many woes
And hopeless years—was he in truth
The loved, the chosen of her youth?
She knew not what of wo and crime
Had seared each form and soul,
Nor how the tides of fate and time
Had borne them to that goal;
So much unlike that peaceful scene
Of stream, and corn, and sunset scone:
And they, oh how unlike to those
Whose fearless joy around her rose!
And yet through sorrow, guilt, and shame,
She knew they were the very same.
Their judge, perchance, he knew them not;
For o'er his brow there passed
No troubled shade of haunting thought
From childhood's roof-tree cast;
Save that his glance, so coldly bright,
Fell with a strange unquiet light
Upon a face that still was fair,
Though early worn and wan.
Yet lines of loftier thought were there;
The spirit's wealth, that ran
To waste, for sin bore darkly down
What might have worn an angel's crown.
And o'er that mother's eye, which yet
Beheld, and wept not till it met
The gaze of her lost girl, there came
A sudden gush of sorrow's stream,
As though the drop that overflowed
Its urn had fallen there.

But when it passed that darkening cloud,
And she looked forth again
On the old river, vanished all
Were city, crowd, and judgment-hall.
The autumn night, with sudden gloom,
Came down on sea and shore,
And silently her cottage home
She sought; but never more
Gazed on the Danube's slumbering wave,
Nor wept above an early grave;
Or cast one look of pride and joy
On rosy girl or blooming boy;
And even from their haunts of play
Her glance was sadly turned away;
But deep in dreamless slumber sealed
Her eyes from all the tears
Whose coming that bright eve revealed.
And well the after years
Kept the dark promise of that hour.
And had the earth's old rivers power
To mirror the far clouds that lie
So darkly in life's distant sky,
How many a loving heart would turn,
Like hers, for comfort to the urn.

INTRUSIONS ON LITERARY MEN.

An author's time is generally his sole estate, a fact forgotten by a class of loungers who are continually honouring authors with their visits, or rather their visitations, and thus sadly interrupting the culture of the said literary estate. Thus, to humour one man, an author is frequently compelled to lay down the pen with which he was going to amuse and instruct thousands, and is also hindered in the attempt to earn his bread. Locke has justly remarked, 'If we are idle, and disturb the industrious in their business, we shall ruin the faster.'

The elder Aldus, the famous Venetian printer, placed an inscription over his door, saying, 'No leisure for gossiping, and those only are admitted who come upon business, which they are especially requested to despatch in as few words as possible.' In the same way, but more gently, a learned Italian wrote over his study door that no one could be allowed to remain with him unless able to co-operate in his labours. The illustrious Robert Boyle found it necessary to advertise in the newspapers that he could not receive visits on certain days, that he might have leisure to finish some of his works. Boileau used to be visited by an idle and ignorant person, who complained to him that he never returned his visits. 'Sir,' replied the wit, 'we are not upon equal terms; you call upon me merely to get rid of your time—when I call upon you, I lose mine.' The amiable scholar, Melancthon, uttered no reproach on such occasions, but coolly noted down the time he had expended, that by greater industry he might make up for the lost time. Evelyn was obliged to study during great part of the night, to redeem the continual loss of time through the calls of morning visitors. 'We are afraid,' said some of those visitors to Baxter, 'that we break in upon your time?' 'To be sure you do,' was the sharp and frank reply. Montesquieu, complaining of one of these bores, says, 'The favour he confers by often passing his mornings with me, occasions great damage to my work, as well by his impure French, as the length of his details.' The biographer of Sir Walter Scott states that the great novelist was always at home to everybody, man or woman, rich or poor, and he never seemed discomposed when intruded on, but always good-humoured and kind. Many a time have I been sorry for him; for I have remained in his study in Castle Street, in hopes to get a quiet word with him, and witnessed the admission of ten intruders besides myself. Noblemen, gentlemen, painters, players, and poets, all crowded to Sir Walter. At Abbotsford, his house was almost constantly filled with company, and it was impossible not to be sorry for the time of such a man thus broken in upon.

AFFECTATION.

Affectation in any part of our carriage, is lighting up a candle to our defect, and never fails to make us be taken notice of, either as wanting sense or as wanting sincerity.—Locke.

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF 'CHAMBERS'S INFORMATION FOR THE PEOPLE,' 'CHAMBERS'S EDUCATIONAL COURSE, &c.

No. 71. NEW SERIES.

SATURDAY, MAY 10, 1845.

PRICE 1½d.

MOTIVES.

THE knowledge that we are rational beings, and that as such we should ever well consider ere we determine to act, seems to have induced the general belief that action, or the omitting to act, is always preceded by some immediate impelling motive. Accordingly, the imputing of motives is one of the most common occurrences in life. No matter what the nature of the subject—be it great or small, important or non-important—straightway is it believed to have had its origin in some motive. If a party give the right, instead of the left side of the way, he is supposed to be actuated by some preconsideration; if he address you as dear sir, instead of my dear sir, there is no doubt about it; if he subscribe himself yours obediently, instead of yours faithfully, it is equally certain; if he omit to take wine with you, the whole affair is as clear as the light of day. Now, nothing can be more incorrect than this view—nothing more true than that on ordinary occasions we all act independently of any motive whatever. In going home from the city, for example, we perhaps invariably walk on one side of the way, although we may have no motive for doing so—not even that of convenience. Perhaps we are occasionally taciturn, and not disposed at all times to be conversible; and yet it may be that for such silence we have not a single discoverable motive. Every or anything else but motive may have an influence in producing the particular state or occurrence complained of or remarked on. Habit, peculiar temperament, accident, thoughtlessness, unavoidable circumstances, may each occasion its portion of the results usually attributed to this otherwise certainly important cause of men's actions; but they are all overlooked in an account of the matter. One party will become exceedingly suspicious at the non-answering of a letter, another very angry at the omission to acknowledge a bow or other compliment. The correspondent in the one case had simply forgotten the letter of his friend—a great offence no doubt, but still not so important as that imputed—and the offending party in the other had omitted to return the bow or other compliment from mere inadvertence. Now, had anything but a motive been thought of, or rather had no motive been assigned, all would have been right. But no: we are, as I have observed, reasonable beings, and therefore must be supposed to act at all times with a view to results and consequences.

Motives are of course divisible into good and evil; and a good motive, if imputed, cannot well be productive of unpleasantness or inconvenience. The misfortune, however, is, that we are more prone to attribute the evil than the good. This unfortunate propensity is occasionally productive of serious consequences. On the occasion of the non-answering of a letter requiring an answer, as on that of the non-return of a compliment,

if a motive be imputed at all, it cannot be a favourable one; hence coolness, severance of friendship, quarrels. In that of simple taciturnity, we have all the evils resulting from a false conviction of pride, ill-feeling, desire of concealing some important circumstance, as influencing the party disposed to hold his peace. How much more good feeling would there be in the world, and how much more friendly communion among those inhabiting it, were it but possible to eradicate this erroneous practice!

One great reason why it should be eradicated is, that the evil or injustice remains not against the party improperly suspected, but reflects in an equal degree upon ourselves. It is a veritable principle in moral as in physical science, that like begets like. Let us attribute improper motives, and we shall find that the same will be attributed to us; nay, we shall perhaps also discover that the other party begins to suspect that there was good reason for that which possibly arose from accident or inadvertence. On the other hand, let us impute those which are good; and if there be one single spark of feeling or principle in the composition of the party to whom we attribute them, we shall find that he will reciprocate; and whether he have good feeling or not, that he will give us credit for having deserved a good opinion, or at any rate will not conclude that we merited the neglect which had been exhibited towards us. These principles are in daily operation. Apart from the subject of motive, which perhaps implies some circumstance with which we are individually connected, let us unjustly accuse an individual of a desire to act unfairly, and we shall discover that he repels the charge with indignation. Let us give him credit, equally unjustly, for a desire to do that which is honourable, and we perceive that he endeavours to deserve it. Our feeling and passions seem so constituted, as reciprocally to act on their like when excited. Thus benevolence acts on benevolence, anger on anger, pride on pride, and self-esteem on self-esteem. Every one knows how the principle operates with respect to the education of children; and it is only to be regretted that it is not more generally regarded in riper life.

It may be true that to impute good motives at all times would be ridiculous. There are certain circumstances under which they cannot be presumed to exist, and which of course are not included in these remarks. It may be also true that in imputing them, we sometimes throw our own conduct open to misconstruction. This can only be, however, when we act without due regard to a principle, and when we impute good motives at one period and bad at another, just according as our whim and caprice dictate. It cannot happen where we make it the rule always to adopt the former course, until we are certain that we are wrong in doing so. In imputing a good motive, we may occasionally find that we have

been mistaken; but the mistake will be on the better side; and it will never occur that we have committed an injustice, or that we have unnecessarily and foolishly lost a friend.

PLANTS YIELDING FOOD.

WHETHER we look upon the vegetable kingdom with the eye of the poet, the naturalist, or economist, we find it alike replete with matter for reflection. To the latter, indeed, it presents a twofold interest; he can at once admire the beauty and multiplicity of its forms, and the value of its products. For the perfect comprehension of its importance, however, it is necessary that he know it botanically; that is, that he be acquainted with the various orders of plants, and their relations to soil, climate, and other conditions; for, without such knowledge, he can never obtain from vegetation the full amount of its utility. Nor is it to any one section that the economist must direct his attention; for, from the lowest members—the *fungi*, to which belong the mushroom and truffle; and the *algæ*, which yield the carageen or Iceland moss—up to the higher forms that produce our grains and fruits, every member of the vegetable kingdom has its interest and value. It is somewhat wonderful, therefore, considering this fact, that we have no general treatise on the *Natural History of Plants Yielding Food*; but that the ordinary reader, to obtain any information on this point, must search amid systems of botany, of *materia medica*, dictionaries of commerce, books of travel, &c. and even after all reap but little from his toilsome pursuit. This desideratum may arise partly from the present imperfect state of our botanical knowledge, and partly from the undecided hypotheses respecting animal nutrition; but chiefly, we presume, from the reluctance which men of science absurdly feel in condescending to inform the common mind. In this particular we believe them grievously mistaken: there can be no degradation in attempting to elevate the knowledge of the masses, and they know little of the true condition of our population if they suppose that there are not among them hundreds of thousands capable of appreciating the facts of any of the sciences, if expounded in plain and perspicuous language.

It would seem, however, that this void in popular instruction is already in course of being supplied, for we perceive that several of our popular institutes have been favoured with lectures on the very subject in question. The Manchester Royal Institution, for example, has recently had a series of lectures by Dr Edwin Lankester, on the *Natural History of Plants Yielding Food*—a published synopsis* of which has led us into the preceding reflections. This outline, brief as it is, abounds with valuable information, and presents the subject in a light so attractive, that no one who sits down to its perusal, but will regret with us that the author should not have extended it to five hundred instead of to fifty pages. As specimens of the style and manner, we select one or two of the commonest subjects—again premising that Dr Lankester's remarks are merely in outline, not in finished lectures.

'Coffee, which is consumed by man in considerable quantities, is the produce of the *Coffea Arabica*, so named from its growing spontaneously near the town of Caffa, in Arabia. Recourse has been had to the use of coffee much more recently than to that of tea. We have no earlier notice of it than 1554, when it was used at Constantinople as a common drink; but it was forbidden, in consequence of its supposed intoxicating properties; and it would seem as if there were no way more likely to make people fond of anything than to interdict it. In 1580, Prosper Alpinus, a traveller, brought it to Venice, and described the means of raising it. In 1610,

it was grown by the Dutch in the West Indies; and in 1652, coffee-houses were established in London. The people of England got passionately fond of this beverage; and in 1675 it was supposed to have an injurious effect on the constitution, and all coffee-houses were therefore suppressed. But another reason was probably this, that people assembled together for the purpose of drinking coffee, and there laid plots supposed to be dangerous to the state. The native countries of coffee at present are Ethiopia and Arabia Felix. It there reaches from 14 to 15 feet in height; is an elegant shrub with white flowers, and has all the characteristics of the class *exogens*. The fruit is a red berry, and in this red berry is contained a little seed, covered with an envelope, botanically called parchment. These seeds vary in different districts and various parts of the world.

'On a chemical analysis, coffee gives a large number of constituents. It gives two or three parts of caffeic and gallic acids, and a narcotic oil mentioned by several writers, but denied by others. However, there was no doubt that it did possess a narcotic oil, even in its raw state. It had also an alkaloid, named *cafféin*; and it is very remarkable that the composition of this is identical with that of *thein* (derived from tea); they were, in fact, one and the same thing, obtained from two different plants. This is very remarkable:—500,000,000 pounds of tea are consumed annually; next, 300,000,000 pounds of coffee are consumed annually in the world, the matter of both beverages containing the same salt. This does seem to point out that there must be something in this salt; that it was not mere accident that led mankind to use two things which undoubtedly act in the same way. Coffee acts in the same manner as tea upon the system, and we use it precisely under the same circumstances: one might be substituted for the other: the only difference is that of flavour: those who like coffee may take it, and those who like tea may take it, with precisely the same effect. However, the preparation of coffee, and the changes which take place in it, will produce some change in its constituents. The coffee is not eaten in the state of the raw berry, but is roasted, during which certain changes take place; an empyreumatic oil is developed, in conjunction with the acids spoken of, and this renders coffee, in some points of view, a different thing from tea. This empyreumatic oil, like all other oils, has the power of arresting decay; and if, as Professor Liebig and Dr Playfair maintain, the action of digestion is very similar to that of decay, and this resembles the process of fermentation, then, as the empyreumatic oil will stop this process out of the body, in all probability it will do the same in the body; and thus we can account for the injurious effects of taking coffee immediately after taking large quantities of food. We arrest the process of digestion; and, instead of assimilating the food, we stop its assimilation, and a large mass is thus kept in the stomach a longer period than usual; the consequence of which is, that a feeling of heaviness and indigestion takes place. Thus we see there is a limit to the use of coffee, which we cannot put to the use of tea, which may be taken after meals, and used so far as the narcotic oil is concerned; but it is only right to observe, that large quantities of any fluid after heavy meals are altogether incompatible with facilitating the process of digestion.

'There has been lately some attention paid to an article which was formerly introduced into France as a substitute for coffee, namely, *chicory*. This plant grows in the greatest abundance in the south of Europe, and is also indigenous to Great Britain. It is found in abundance in the long magnesian limestone tracts of Nottingham, Yorkshire, and Durham. The root of this plant has been actually used as a substitute for coffee. He had on the table some of the dried roots, in the state in which it was employed. The decoction was coloured very much like coffee; but, when boiled alone with water, had a much less agreeable flavour. Why had it not been used alone? Because in chicory we have no alkaloid; we have no

* Report of Lectures on the Natural History of Plants Yielding Food, with incidental remarks on the Functions and Disorders of the Digestive Organs. Delivered by Edwin Lankester, M.D., F.L.S., &c. Churchill, London: 1864.

oil; we have a quantity of resinous matter; a certain quantity of a matter closely resembling *lactucarium* (a narcotic substance obtained from the common lettuce), and which is the only constituent for which chicory can be used. All chicoraceous plants possess a milky juice, in which resides a narcotic element. Chicory, then, he believed, could not in any way be used as a substitute for coffee. It had not been examined carefully, and therefore he did not pledge himself to the examination of that particular; but it had been proposed as an addition to coffee, and used extensively as an adulteration to coffee. He wished to draw the distinction between the addition of chicory to coffee, and the adulteration of coffee with chicory. In France, where they use more coffee than we do, chicory is added in small quantities, and persons will not drink coffee without it. It has been used in this country by the fraudulent seller to adulterate coffee; but he had no hesitation in stating that coffee, prepared with small quantities of chicory, was much more pleasant to the taste, and less liable to interfere with the process of digestion, than when taken without chicory. He was not prepared to explain how this was; but still we might find something in chicory which combines with the oil of coffee, so as to render it comparatively less injurious. Thus chicory was added throughout France and the coffee-drinking part of Germany, to prevent these supposed ill effects of coffee. Persons in this country, when not aware that the coffee is adulterated with chicory, or that it has chicory in it, prefer it with this addition. He knew a respectable coffee dealer who conscientiously objected to put it in. He kept on selling his coffee, but lost gradually almost all his customers for that article. He was not able to account for it at all; but an old lady, who had long been his customer, at length said, "You don't sell such good coffee as your neighbour." He examined his neighbour's coffee, and found chicory in it, which might easily be detected by throwing some of it into water, when the chicory will float. The next coffee he sold to her he added some chicory, and she said, "Now your coffee is very good." He added some to his commonest coffee, for his own use, and his wife exclaimed, "My dear, you have been giving us some of your best coffee." Then he added a little to the coffee of his stock; and soon he did not send out a pound of coffee without chicory, and his coffee trade is now larger than ever. There was this to be said too; at one time it was the law that a person adding chicory to coffee was liable to a penalty for adulteration; but government had now legalised the addition of chicory to coffee, and it might be legally added. He would say to those who were in the habit of grinding their own coffee, that they really would find it an agreeable addition to purchase chicory, and add a little to it. They would then be sure that the dealer did not add too much chicory, which was in fact the real danger; chicory being a much cheaper article than coffee.

In the same pleasant manner Dr Lankester treats of tea and its proposed substitutes; of Paraguay tea; of potatoes, arrowroot, tapioca; of wheat, rice, maize, and the other grains; of vegetable oils, of cocoa, and the edible nuts; of acid fruits, as the orange, lemon, apple, &c.; of sugar and the sugar cane; of the grape; and of the numerous products of fermentation, as wine, beer, and spirits. From this inviting field we select another common example, once more recommending the whole to the best attention of our readers:—

* *Wheat*, so extensively used as an article of food, is the produce of a plant called *Triticum hybernum*, belonging to the natural order *Graminaceae*, or grain-bearing plants, which, although so apparently insignificant as to contain all the common grasses that prove such pests in our gardens, also included wheat, barley, oats, rye, millet, maize, and the sugar-cane. We were lost in attempting to trace the origin of the use of wheat amongst mankind. It seems to have been used from time immemorial, and there is no question that the earliest records in the Bible refer to this form of

wheat. He showed stalks in ear of wheat, barley, and oats, and observed that the grain was merely the fruit of the plant. In preparing the grain for food, the pericarp or covering of the seed was separated in the form of bran, and all that was used was the interior, which was really the seed. Wheat is cultivated extensively throughout Europe and several other parts of the world, and forms the great basis of European food; and the importance of attention to its cultivation had become much more apparent from the investigations of modern chemists. Wheat contained certain principles which we could supply from without. Previously to our knowledge of this fact, we were in some difficulty as to the proper way to supply food to this plant, so as to obtain from it the greatest quantity of nutritious matter; but the investigations of chemists had led us to see what were really the elements of which wheat consists. The principal components of wheat are starch, gluten or fibrin (protein), and a certain number of inorganic constituents, and these were found not to be unimportant in wheat. Although we had starch maintaining the heat of the body, and protein building up its fabric, we had still these other ingredients hitherto regarded as unimportant; and one of these was phosphate of lime, of which the bones of animals were composed; so that these particles in the wheat were taken into the system to build up the bony fabric of the body; and had we not this small portion of phosphate of lime, our bones would not acquire that hardness necessary to maintain the muscular fabric laid upon them.

One of the simplest modes of preparing flour was that of which he had specimens on the table, in the form of a vermicelli and macaroni; which substances were prepared by moistening flour and passing it through moulds, so as to give the substance its form. This wheat contained a different kind of starch from that of ordinary European wheat, or it would not be able to assume that form. The subject had not been sufficiently investigated how it was the Italian wheat assumed this form so much more readily than other European wheat. Macaroni was used in puddings, pies, &c. and, as well as vermicelli, was introduced into soups, and was an exceedingly agreeable article of diet. Another preparation of wheat flour was called "farinaceous food." It was a secret preparation, and was sold by persons to be used as food for children, being merely flour submitted to heat; and, so far as he was aware, he believed nothing of an injurious kind was added to it. The advantage of submitting flour to heat, previously to preparing it, was, that the little cells of starch were thus burst, and the starch was then more readily acted upon by the stomach. This pointed out the necessity of cooking, so as to burst the cells; for, when used as food without previous cooking, the starch was not so easily digestible. This would account for the fact, that many fruits eaten raw were not easily digestible. Many fruits contain considerable quantities of starchy matter, and subserve the purpose of respiration on that account; and these fruits, such as apples, pears, &c. would be much more easily digested in the stomach, if previously heated. Bread was the principal form in which flour was cooked; and there were two modes of making it—fermented and unfermented. The advantage of fermenting the flour was, that, thus prepared, it was lighter and more easily digestible than the unfermented bread, such as captains' and sea biscuits. In the process of cooking, a fermentation went on very analogous to that in sugar for the purpose of forming alcohol, and it was well known that considerable quantities of alcohol were given off from bread during the period of its being baked. This fermentation had been called the panary, in order to distinguish it from the vinous and the acetous fermentation; but it was questionable whether it was different from the vinous. At one time, in London, a company was established for the purpose of baking bread, and they had an apparatus for condensing the

spirit from the bread, and thus carried on the two different trades of bakers and distillers. However, the poor people got to know that the spirit was abstracted from their loaves, and they were prejudiced against the company—a prejudice of which the bakers availed themselves, by putting bills in their windows, "Bread sold here with the gin in it."

Bread was exposed to considerable adulterations, the most common of which, in London, was the use of alum, which acts as an astringent upon the system, though not a poison. It might easily be detected by the application of the usual tests for alum, and it should be carefully avoided. Of all the forms in which bread could be used, that which was most wholesome and best adapted for the system was that of brown bread, in which form the flour contained a small portion of the bran. Its advantages were, that the brown particles, or outside pericarp of the seed, contain a volatile oil, which acts as a stimulant, and assists digestion; there is also a mechanical action of the particles of bran; and many persons were much relieved from indigestion and its consequences by eating brown instead of white bread. There was a new mode of preparing bread without fermentation, and yet not unleavened like rusks or biscuits. This consists in preparing the flour with carbonate of soda, adding to it a small quantity of hydrochloric or muriatic acid, which sets free the carbonic acid, and during the process of baking, the carbonic acid acts in the same manner as in fermentation, and throws up the bread into that vesicular form which makes it light and easy of digestion. It ought to be mentioned, that starch had one peculiar property—that of entering readily into combination with oil, forming a peculiar chemical compound, exceedingly indigestible; but which was not formed at a low temperature, so that the starch in ordinary bread and butter would not combine with the butter, but it would so combine with oleaginous matter in baking or boiling; and this was why pie-crust and other matters were so exceedingly indigestible. Plumcake, plumpudding, pancakes, &c. ought to be interdicted altogether as articles of diet, by those who wish to retain their digestive powers in all their original integrity.

THE DISAPPOINTED SETTLER.

We lately noticed the lively account of a Van Diemen's Land settler's experience in the bush, and how, after a number of years of toil and anxiety, he was able to look around with satisfaction on the extent of his possessions. Here is a work of quite a different stamp—Mr Richard Howitt's account of his attempted settlement in Australia,* the vexations he encountered, and the reasons which ultimately induced him to throw up the whole affair in disgust, and return to old England. While in the one case perhaps too little was said of the troubles to be encountered in the bush, in the other they are brought forward and dwelt upon to an extent which leads one to fear they are overdrawn. Making every allowance, however, for feelings of chagrin and disappointment, we believe that Mr Howitt's revelations of what is necessarily to be endured for several years in any of these colonies are in the main correct, and their publication may be of no little service to persons who are contemplating emigration. Gathered from a number of irrelevant matters, including scraps of poetry, with which the volume is crowded, the following is the substance of his story.

On the 30th of August 1839, he embarked at Gravesend, along with a brother and nephew, for Port Phillip, which was reached, after a short stay at Van Die-

men's Land in passing, on the 5th of the ensuing April. Arriving in the Port Phillip district when the land mania was at its height, it was difficult to procure a location at a reasonable price, and after seeing many dear lots, and much bad land, an allotment of ninety-five acres on the south side of the river Yarra was purchased. The situation looked delicious, the soil was tolerably rich, the slopes most graceful, the windings of the Yarra, near and far off, were beautiful; white cockatoos were sitting on the old gum trees, and parrots were flitting about gorgeously numerous. In this promising little paradise the emigrants planted themselves on the 2d of October, and set about getting a weather-boarded cottage from Melbourne. This proved a difficult matter. At that time the district was at the height of its prosperity; all was activity; all the drays and the workmen were fully employed. A carter, with a horse and dray, considered it poor work to get only six pounds per week. After a fortnight's search in quest of one of these gentlemen, one was found who obligingly carted the cottage to its future station for six pounds. All things considered, this was poor payment. There were no roads; the face of the country was covered with growing trees, or with partly burnt timber, boughs, and rank grass, to say nothing of the bed of a torrent, full of rough stones, and partially flooded, which required to be crossed. However, by dodging backward and forward, the dray finally brought the cottage to its location; the only accident which occurred being an unfeeling jolt among the rocks, which threw a basket of glass and tea-things to the ground in irretrievable ruin.

There was now, proceeds Mr Howitt, 'employment enough before us in the wilderness. Our house was in about a week erected. The first night that we slept in it, it was but partially roofed, and the bats made free to flit about over our heads, and the moon and stars to peep in; the one with bland smiles, the others apparently regarding us with prying eyes.

'When our wood-work was completed, there also wanted brick-work—a chimney to make our abode convenient and comfortable. Here again was a new difficulty. I ran here and there to persuade people for good money to bring us the required number of bricks. It was worth nobody's while: nobody would do it. Well, we had been woodmen, house-carpenters; we grew weary of begging to have that done for which we must also pay handsomely. We set ourselves industriously to find clay, and found it too; yes, and made a brick-mould and bricks. Yes, and we burnt them too. Pretty figures we were both during the making and the burning of the bricks; and many a hearty laugh we had at ourselves, saying, "What would our English friends say if they saw us?" But the bricks were good bricks; and my nephew, one of the most ingenious as well as industrious men in the world—and considerate too—had not neglected to bring a bricklayer's trowel with him; and, like a good Jack-of-all-trades, he built the chimney, and did it so cleverly, that it passed muster with the world's other chimneys.

'This carpentering and brickmaking, this house-building, was done after all somewhat grudgingly, for the gardening season was passing by. Nevertheless, we dug up the ground for a garden between whiles, planting fruit trees, setting potatoes, peas, &c. Then and after we made a large and useful garden, only it was not fenced in, for we had no time to do that. We trusted that our vigilance, and that of our two faithful dogs, would be a fence for it until we could make one. Then we had to begin land-clearing. The steep fronting the Yarra had many large stones in it, and to get out these, and also in many parts of the garden, was the labour of weeks. Then to cut down the timber, gum, box, she-oak, and wattle-trees, was a Herculean task.

'Day after day, it was no slight army of trees against which we had to do battle; we had to fight hard with them to gain possession of the soil, for the trees in those days were giants. I then felt thankful, knowing well how to appreciate my advantages, that having been born and brought up on an English farm, all kinds of tools, agricultural and others, were at home in my hands. There was

* Impressions of Australia Felix, by Richard Howitt. London: 1845.

a world of work, digging to lay bare the roots, felling, and then cutting the boles and boughs up with the saw and axe. Such of the boles as were good for anything we cut into proper lengths for posts; splitting and mortising them for that purpose. Rails also we had to get when there were any boughs straight enough. Some of the trees were of unconscionable girth, six or eight yards in circumference. Immense was the space of ground that had to be dug away to lay bare the roots. And then, what roots! They were too large to be cut through with the axe; we were compelled to saw them in two with the cross-cut saw. One of these monsters of the wild was fifteen days burning, burning night and day, and was a regular ox-roasting fire all the time. We entirely routed the quiet of that old primeval forest solitude, rousing the echo of ages on the other side of the river, that shouted back to us the stroke of the axe, and the groan and crash of falling gum trees. Night never came too soon, and we slept without rocking. Then what curious and novel creatures—bandicoots, flying squirrels, opossums, bats, snakes, guanas, and lizards—we disturbed, bringing down with dust and thunder their old domiciles about their ears. Sometimes, also, we found nests of young birds and of young wild cats; pretty black creatures, spotted with white. The wild denizens looked at us wildly, thinking probably that we were rough reformers, desperate radicals, and had no respect for immemorial and vested rights. It was unnatural work, and cruel; especially when, pile after pile, we added to our other ravages the torment and innovation of vast fires. The horrid gaps and blank openings in the grand old woods seemed, I felt at times, to reproach us. It was reckless waste, in a coalless country, to commit so much fuel to the flames. Timber, too, hard in its grain as iron almost, yet ruddy and more beautiful than mahogany. No matter, we could not eat wood; we must do violence to our sense of the beautiful, and to nature's sanctities; we must have coal-land; and we, with immense labour, cleared seventeen acres. On one occasion I was laid up for a fortnight, keeping my bed part of the time, having been struck by a falling tree. I had to change almost immediately my linen; wringing wet with the perspiration of that blow's agony. Still, the most vexatious circumstance of that misery was the lost time.

The troubles of woodcutting being for the present over, new vexations arise. A garden which had been made and planted was beautiful; but one night the cabbages were devoured by a stray bullock, and this led to a long spell of fencing. This being done, other sorrows turned up. A dray with four bullocks being indispensable, they were bought; but the vehicle requiring to be strengthened at the blacksmith's, a week was spent in the operation; and when all was ready, it was discovered that one of the bullocks had escaped. Days and days are spent in searching for the vagrant animal, and at length he is found; but in the meantime he has been caught and sold, and it is a long ravell'd business recovering him. He is brought home just as the wet weather sets in.

'Wet as the weather was, we commenced bringing down our fencing materials. And through what a kind of country we had to bring them! Along the sides of sloping hills, and through marshes, and deep break-neck ravines. Our first attempt was unfortunate: something about the pole of the cart broke, and off the bullocks set in a gallop—crash went the wheels against a tree, and the cart was broken, the team all at liberty. The bullock-driver declared it to be useless trying again, for not one of the four bullocks were leaders. Two more bullocks were bought, after nearly a week's inquiry, and a dray was borrowed. Again and again, when the weather would permit us, a load was got down. I walked up the ten miles and home again, that if any accident happened, I might be at hand to render any assistance. Day after day I went: for if I did not go, I had no rest at home through apprehension. Sometimes at the gulleys or ravines we had to unload the cart for it to get over, and, when over, to re-load it. On some occasions we had the bullocks down; and then there was danger of their necks being broken; it was a time of great uneasiness, and great anxiety. Once we had decided for John, with the team, to go up one day, stay all night with the splitter, and so return the next. Days passed over, and no John returned to allay our anxiety: the bullocks in the forest got constantly lost; again we had recurrence to our old plan; again there was delay, the splitter was ordered to shift from his place to another, the land there being sold. This done, and the weather still finer I began to think fortune

would favour us now, and that we should progress more satisfactorily. So thinking, John and I went up with the team towards the new splitting location. Before we reached it, a man came running nearly breathless, exclaiming, "Thank God you're come; poor Ellen, Mrs Smith's companion, is burnt to death!" So it proved, at least partly so. The poor young woman was burnt dreadfully. Standing by the out-door fire, the breeze had blown her apron into the flames, and, running in her fright, she had helped it on most fatally. In our cart, leaving our post and rail, she had to be taken into the town, where she died. This lost us three more days. Wearied out, we hired the carriage of the rest, and had L.9 to pay for their conveyance. So days, and weeks, and months had passed away vexatiously. Then, when all the materials were carefully got over the river, came a flood and swept a great portion of them into it.'

This brings the settlers to May 1841, and now terrible anxieties are felt about ploughing, fencing, and sowing. The fencing was the grand standing annoyance. While about it, the sowing season went by, and the corn having been put too late into the ground, the crops were worthless. 'Thus one year's labour, outlay, and seed, were thrown away. Still, there remained to us hope: we did not relax our endeavours. Other seasons there would be, and, by fencing and clearing other portions of the farm, we prepared ourselves to take advantage of them. On still we progressed—field after field was cleared and enclosed. Land and produce came down in value every day; we were toiling against hope—"We were not at rest, and trouble came." It was now time to plough again; but three of our bullocks had strayed away, and were nowhere to be found; to buy others would have been madness, in the every-day depreciation of all kinds of property. Search everywhere, and offered rewards of L.1 each in the newspapers, were tried in vain. A year and a half elapsed before anything was heard of them, and then only of two. The second season was lost, or nearly so. Our garden was tolerably productive, and on the land, without any seed or labour, there was an immense though coarse crop of oaten hay. These second, and even third crops, there being no winter to kill them, are under some circumstances advantageous; they also prove a curse, growing where and when they are not wanted. Three, four, or five times the land must be ploughed to get rid of the old plants of corn, potatoes, &c.

The nephew now gets disgusted with the farm, and joins a friend of his recently arrived from England at cow-keeping. 'They purchased three cows and calves with them, and a few dairy articles, for L.30. My nephew and his partner kept their cattle in the open bush sometimes, and sometimes in our paddocks. Part of the milk they sold at home to the labourers employed by government on the Heidelberg road, and the rest in Melbourne. This, after a fair trial, proved to be like most other colonial undertakings. It seemed well to realise twenty pounds in about six months; but the cattle began to give less milk, squatters near Melbourne began to undersell them, and cows daily lessened in value. There was nothing so certain as that every week would add to their loss. At length, after keeping them a year, the concern was disposed of for, cattle and all, L.16; leaving a few shillings per week net profit. So much for Australian cow-keeping.'

One day unexpected visitors appear—"Being alone in the house, I heard the most melancholy noise in the bush, not far off: I thought some one had met with a serious accident, and ran out terrified. It proved to be the fore-running announcement of three coming black fellows. Two women, one with a piccaniny at her back, had turned down to the ford below. Three men came forward. One of them had on a short white sailor's frock, and common black wool hat. The others had brown blankets wrapped round them loosely. Their hair was ornamented with white cockatoo feathers, and profusely with kangaroo teeth. Their object was to beg white money. When I turned one of my pockets out to show them I had nothing, they laughed in their loud manner, and felt at the other. So away they went dissatisfied; and they, with the women and child, busied themselves in crossing the ford. Soon they disappeared in the bush on the other side of the river. The men were armed with spears and waddies.'

About Christmas 1841, the disconsolate settlers have great yearnings to return to England, which they begin to think not such a bad country to live in after all. However, at the beginning of 1842, they courageously set to work to clear and improve a meadow of three acres. Trees, stumps,

and boughs, are got rid of by enormous toil. 'If ever a bit of ground was earned by the labour bestowed upon it, that was. The rising sun found us felling trees, severing with our saw the trunks, and grubbing up roots; under the burning noonday sun we were often roasting ourselves by huge fires; and the sun dipped down in the western waves, leaving us, thankful for the short cool twilight, still at our labour. What was the result? We made the plot of land like a garden, fenced it with the post and rail split by ourselves out of the timber we had felled; planted it with potatoes; and, just as the rows were looking green and beautiful, there came a flood, destroyed the crop, and we had to plant it again. Nor was that the only loss: there were two splitters located near us, and these men I had engaged to get for me, as they had a license to split timber on the crown lands, a quantity of posts on the opposite side of the river; these, for which I had paid nearly six pounds, were carried away also.'

This was the finishing blow. All the poetry of Australian farming had now evaporated. The farm was let in February 1843 to the nephew, who got everything into first-rate order. Wheat, oats, barley, potatoes, cabbages, turnips, onions, all in their rich luxuriant greenness, how well they looked. No man in Australia, however, should reckon his crops before they are housed. The fine-looking crop of potatoes was destroyed by a flood. Fresh potatoes were sown, but as soon as they came up in goodly rows, the tops were attacked by myriads of flies, and what escaped the flies was devoured by clouds of grasshoppers, before which everything green disappeared. Rows of full-grown cabbages were hollowed like egg-cups; not a particle of vegetation escaped destruction. This was a grand consummation—the fly, flood, and grasshopper year! At the beginning of 1844, the nephew gave up the farm, which was re-let, and it was now unanimously resolved to quit the country. The party of unfortunates accordingly return to England, which they are delighted once more to behold. 'And here,' says Mr Howitt, concluding his narrative, 'I was again in England, where our forefathers, sleeping, generation after generation, in the bosom of their green and beautiful land, where they age after age not only fashioned for themselves, by their industry, comfortable homes of rural enjoyment and rest, but bequeathed it to their descendants better cultivated, a more wealthy and habitable country. The labour, affection, and cares of its myriads of sleeping benefactors, who toiled, adorned, and fought for it, have made it what it is—conspicuously the glory of all nations, a paradise of love, and joy, and liberty. Not, alas! wholly exempt from crime, and war, and want, and disease; but animated by a quick spirit of Christian philanthropy, every day rendering the sum of these less and less. Full of these sentiments, and strongly impressed by the sense of our national greatness, and unwearied activity in the diffusion of universal good, I blessed the land in my heart; and was satisfied that the most singularly earthly good fortune, the greatest honour that could fall to the lot of mortal man, was to have been born in England; and the truest earthly wisdom, to endeavour to live in it!'

So ends the history of a disappointed settler; and now for the moral, if there be one. It appears to us that Mr Howitt, like hundreds of others, had expected too much in his adopted country—was perhaps heedless in buying land before he became fully acquainted with the district and its climate—imprudent in some of his undertakings—and wanted that cool patience which every settler should possess. Emigration is a step which no one ought to take without being able and willing to endure the greatest hardships and anxieties, in many instances to submit to privations scarcely felt by even the most abject of our population—all with the reasonable prospect of ultimate advantage. We would, in plain terms, put every intending emigrant through the following catechism, not bating him a single iota:—Will you be contented to lie for a time on the bare ground, or at all events in a miserable turf hut, no better than a pig-stye? No. Then you must on no account go to Australia. Can you submit to live for years on mutton, damper, and tea? No. Then don't think of going to Australia. Can you go unshaved, and never entertain the notion of having your shoes brushed? No. Then we would recommend you not to go to Australia. Can you submit to be tormented and half eaten up with insects? No. Then it is out of the question

your going to Australia. Can you milk a cow? No; but I will try. Then our advice is, if you want a genteel and easy profession, lay out your money in cow-keeping, and stay at home.

THE STREETS OF LONDON.

NO. II.—THE SEVEN DIALS.

In the midst of the populous district that extends between Monmouth Street on the west, Drury Lane on the east, High Street St Giles on the north, and Long Acre on the south, is situated the small congregation of streets long known by the name of the Seven Dials. The place was originally built about the year 1694, as may be seen from an entry in Evelyn's Diary under date of the 5th of October in that year; in which he says, 'I went to see the building beginning near St Giles's, where seven streets make a star from a Doric pillar, placed in the middle of a circular area, said to be built by Mr Neale, introducer of the late lotteries in imitation of those at Venice.' Gay, in his *Trivia*, canto ii., thus describes it:—

'Where famed St Giles's ancient limits spread,
An innrall'd column rears its lofty head;
Here, too, seven streets, seven dials count the day,
And from each other catch the circling ray.'

The place wears a different aspect now. The 'innrall'd column' has long since disappeared, and the original seven dials with it. Of late years an attempt has been made to restore the 'dials' in another shape. The seven streets have escaped amid the improvements that are being effected all around them, and run into the same small area as heretofore. When we last passed through it, not many months ago, four out of the seven houses that form the angles between the different streets were occupied as gin-shops, or 'palaces,' and each of these had a large clock with an illuminated dial in its uppermost storey. These dials, with the houses to which they belong, form the most remarkable characteristics of the place. All around are poverty and wretchedness: the streets and alleys are rank with the filth of half a century: the windows are half of them broken and patched with rags or paper; and, when whole, are begrimed with dirt and smoke: little brokers' shops abound, filled with lumber, the odour of which taints even that tainted atmosphere; and the pavement and carriage-way swarm with pigs, poultry, and ragged children. These are the objects that meet the gaze of the stranger on every side, as, from the midst of the dials, he looks down either of the seven thoroughfares that have their confluence in it. But in the space called the Dials itself, the scene is far different. There at least rise splendid buildings, with stuccoed fronts and richly-ornamented balustrades; windows of valuable plate glass, and mahogany doors revolving on easy hinges, and ever half open to afford the passer-by a glimpse of the spacious, handsome, and well-stocked apartment within. These are the gin-palaces for which the spot is celebrated, the very Brocken of the fens of intemperance, that here meet to hold high saturnalia. From six in the morning until midnight, the liquid poison is dispensed, at three-halfpence per glass, to crowds of idle, debauched, and vicious men, and squalid and dissipated women; and in no other place in London can the intemperance of the London populace be seen to more advantage or disadvantage than in this. A description of one of these houses will suffice for all, as, in their principal features, both external and internal, each bears a strong likeness to the other.

It is always a great matter to appeal to the eye and the imagination of the multitude, and the keepers of London gin-palaces know it full well. They exhibit to their customers a magnificence which they may not only admire from a distance, but which they may share—which is, in fact, their own, and has been created for them. The beggar in his rags, the street-sweeper bespattered with the mire of the crossings, the meanest and the most miserable of man or womankind may look, it is true, at the

wealth displayed in the windows of the jewellers and linen-draperies of London, but they may not enter; they may admire, but they may not touch; and this admiration not unfrequently leads to envy and jealousy, and sometimes to a still fiercer feeling. The splendour of the gin-palace, which is often superior to that of the goldsmith or the dealer in the finest products of the loom, has, on the contrary, been raised for the especial enjoyment of those who are dirty, wretched, and vicious, if they can but command the small sum of three-halfpence. With this they can enter a large and warm room brilliantly illuminated with gas, and adorned with handsome mirrors, in which, behind a counter or 'bar' of finely-polished or carved wood, stands an obsequious and obliging person, male or female, to supply their wants, and hand them the clear draught of intoxication with smiles of welcome. All around are arranged huge vats, or the semblance of them, on which are inscribed the tempting words, 'Cream of the valley,' 'The milk of life,' or 'Old Tom,' while large printed placards state that 'millions' of gallons are in stock; flattering the imagination of the poor with the notion of the inexhaustible stores of the cellars beneath. The legislature has forbidden the owners of these establishments to provide seats for their customers, under the heavy penalty of the forfeiture of their licenses. Notwithstanding this discomfort, which was invented with the view of discouraging drunkenness, but which is very far from answering its intent, the gin-palaces are far more crowded than the old public-houses ever were, although the latter provided seats and every other requisite accommodation. Their 'bars' are besieged by eager clamants, who would forego not only a seat, but even bed and board, sooner than their 'cream of the valley.' Hither husbands bring their wives, and wives (most horrible!) their children. Here they crowd, not only for the sight of more wealth and luxury than their own hovels or scantily-furnished attics can afford them, but for the warmth, the light, the conversation, and the excitement with which the place supplies them at so cheap a rate. In some of these shops, though fortunately not in many, it has been known that a small stool or pair of steps has formed a part of the usual furniture, for young children to stand upon, so that their heads might appear above the counter when they swallowed their small glassful. The most melancholy truth of all remains to be told, which is, that it is not from mere thoughtlessness or misjudging kindness that wretched women act thus towards their offspring, but from a calculation and the working out of the dire problem which misery and vice have set them—the problem how to kill without murdering the helpless beings that depend on them for subsistence. A woman, haggard and ragged, with sallow face and sunken eyes, and with a sickly and melancholy-looking child of six years of age, to whom she was administering gin, was asked how she could be so thoughtless. Her reply told a dreadful secret. She said that she gave the child gin because it satisfied a craving, and destroyed the appetite; and because, in a word, it was cheaper sustenance than bread. Nor was hers by any means a solitary case. The same fearful story has been told repeatedly before magistrates and judges; and the hapless victims of so cruel a sacrifice have long crowded the three houses which are always open for the devotees of gin—the workhouse, the hospital, and the prison.

The Seven Dials is a place which should be seen between the hours of eight and twelve on a Saturday night, by him who desires to witness the intemperance of a London populace at its full height. Though the scene cannot but fill the friend of humanity with mournful feelings for the self-abasement of his kind, it is not without animation. It has its ludicrous as well as its melancholy side; its fierce excitement, its reckless merriment, and its striking contrasts of the maddest mirth with the most squalid misery. Let the reader imagine the small space we have described glowing with gas-lights and crowded with people. From four

or perhaps five large gin-palaces—cramped almost to suffocation with men and women, girls and boys, people of all ages—arises a confused hubbub of voices, intermingled now and then with shrill screams, loud laughter, or hoarse imprecations. When a door opens for the ingress or egress of one of the drinkers, the Babel of voices sounds louder and louder into the street, and drowns for the time the faint imploring cry of the numerous beggars who are stationed without, to catch the charity of those whose sympathies are most excitable when they are most inebriated. It is difficult to pass through the street for the multitude of people, composed of match-venders, children with weak thin voices selling tapes and pins, hoary-headed old men, looking as feeble and ill as if they had risen from the bed of death to mingle once more in the tide of human existence ere they sink beneath it for ever, singing love-songs with tremulous and scarcely audible voices; apple-women and fish-women selling their wares; and, noisiest of the throng, the ballad-sellers with stentorian lungs calling out the names of the last new songs, often in strange and startling combinations enough, and offering them at the rate of a halfpenny per yard. Ever and anon there is a rush of many feet, as some obstreperous drunkard is forcibly expelled for his noisiness or quarrelsomeness; and the crowd gather round him to cheer him on to further excesses, and take pleasure in the sight of his degradation, as he clamours fiercely for readmission, and threatens with fearful oaths to break all the windows in the house if he is refused. If it be a woman who has created the disturbance, the uproar is louder and more prolonged. The shrill voice rises high above the din; and if she threatens to smash the windows or do other damage, she fulfils her threat, and sends volleys of stones through large squares of glass, amid the ironical cheering of the delighted crowd. The drunken man is led off to durance by the police with comparative ease, but the drunken woman is more difficult to manage. She will not be led off by the police; she scorns to walk, and will either go in a coach to the station-house, or be carried. She throws herself upon the ground or into the gutter. She kicks and screams and scratches, and with horrid oaths, and a volubility of curses—which sound doubly odious from woman's lips—declares her good-will and pleasure to tear out the eyes of the first person who approaches her. She is ultimately carried off by four men, two at her head and two at her heels, followed by a crowd, who abuse the police instead of sympathising with their most unpleasant duty, and call them harsh names for their cruelty to a woman. By her removal comparative quiet is for a while restored; the ordinary hubbub alone resounds; except that perhaps some strolling band of musicians strike up their merriest tunes to increase the uproar, and win their share of the copper coins that workmen and their wives have to spare from the gin-shop. As it approaches towards midnight, the venders refuse to supply more liquor, the lights are extinguished, the shutters are closed, and the uproar gradually begins to subside. Those who are still able to guide themselves find their way home; some sit down upon door-steps and sleep till morn, in utter unconsciousness that they are not in bed; while others roam through the town in a more active state of intoxication, and disturb many a peaceful neighbourhood, till the strong arm of authority removes them to the lock-up. This is the ordinary scene in Seven Dials on a Saturday night; and the same drama is enacted, with but slight variations, in scores of the most populous thoroughfares in London—in Whitechapel, in Lambeth, in Somers Town, in east, west, north, and south—and not on Saturday night only, but every night of the week. Though many thousands of the working-classes of the metropolis have taken the pledge of total abstinence, and kept it, there is no visible diminution of the evils of intemperance. The stream of vice seems full to overflowing, and always to be replenished, whatever drains may be made from it by the great apostles of social improvement.

We have dwelt so long upon the drunkenness which is the outward and visible sign of the Seven Dials, as to have left ourselves but little space to give an account of its literature, for which it is even more celebrated. The Seven Dials has long been known as the great mart of songs and street ballads; and the press of Catnach has acquired a wide-spread renown for its humble but apparently inexhaustible stores of broadsides. There are two other printers of the same class, who provide ballads for the hawkers, to be retailed at a halfpenny per yard. They find their chief customers in servant-girls and footmen, and more especially among those just raw from the country, to whom the excessive cheapness is not the least of the novelty or the temptation. These are the real songs and ballads of the English people, and generally include that universal favourite, 'Black Eyed Susan,' or 'Sally in our alley,' 'All round my hat,' or that famous poaching ditty, 'It's my delight, on a shiny night, in the season of the year,' or the more modern effusions of 'Some love to roam,' 'The sea, the sea,' 'Jim along Josey,' 'Jim Crow,' 'Meet me by moonlight alone,' 'We met—'twas in a crowd,' 'The soldier's tear,' &c. All these and a score or two more are often included in the halfpenny yard; with the addition of illustrative woodcuts, the which, if by any rare and singular chance they should alone survive to future ages, would convey the impression that art was in its first rude dawning in England in the year of grace 1845. Here also are not only imprinted, but written, the last dying speeches of notorious criminals—all composed upon the Tyburn model of the age that has passed away—and the rude ballads in which the incidents of the murder are chanted for an admiring populace to the old airs of Derry down or Malbrook, with a chorus fully as long as the stanza. We well remember buying the ballads in which the deeds of Greenacre and Daniel Good were all set forth in the minutest particular, and in the most uncouth rhyme and most villanous grammar. They had both the mark of the Seven Dials upon them; but appearing, as they did, in the light as it were of a new work, of which the copy-right was of additional value, there was but one ballad for the halfpenny, and not the yard with a half-hundred, which could have been afforded had this been old as the few above named. Upon some future occasion we may perhaps give the details of a visit we once made to a Seven Dials' poet, the concocter of these and various other popular effusions of a like calibre; but in the meanwhile we conclude by mentioning that vast quantities of ballads and dying speeches are exported from the Seven Dials into all the rural districts of England; together with cheap 'Dream-Books,' and 'Oracles of Fate,' and other trumpery of the same class, which all find in the provinces a much readier market than in the capital.

SHIPWRECK OF THE DELPHINE.

TRANSLATED FROM THE FRENCH.

[THE subjoined, though perhaps less characterised by startling occurrences than many other narratives of a similar nature, may yet possess some claims to our attention from the successful issue of the persevering efforts adopted for the safety of the isolated victims of calamity. The painful interest attaching to events of this nature, is increased in the present instance from its having taken place in the same region as the shipwreck of the *Wager*, one of Anson's squadron, of whose wreck so interesting an account has been left by the ancestor of the poet Byron. The peninsula of Tres Montes, mentioned in the following translation, is the same over which, it may be remembered, Byron and his companions passed with their Indian guides. All the travellers who have visited that part of America agree in their description of the climate, which is bad in the extreme. Everything is always wet: there are scarcely ten days in a year on which snow or rain does not fall;

and not more than thirty on which it does not blow with the greatest violence. The island of Chiloe is situated in a great bay at the southern extremity of Chili, and is the largest of a group the number of which, comprehending those of Chonos, is eighty-two. With these remarks, which were necessary for the proper understanding of what is to follow, we proceed at once to the narration.]

We sailed from Havre for Valparaiso on the 30th March 1840, in the ship *Delphine*, Captain Coisy, with a crew of sixteen sailors and four passengers. In three days we were clear of the channel, and, the wind being favourable, saw the Canaries and Cape de Verd Islands, and soon after crossed the line. In short, at the expiration of thirty days from the time of our departure, we had reached the latitude of Rio Janeiro. The wind then became contrary, and, forcing us to lie to, so retarded our progress, that we did not arrive in the latitude of the Falkland Islands until the 28th May. On the 30th we saw Staten Island, and on the 9th June Cape Horn and Terra del Fuego. In spite of the usual stormy weather of this region, and the enormous masses of floating ice which we encountered in all directions, we doubled the Diego Islands on the 11th. The bad weather still continued: but on the next day a short interval of brightness enabled us to take an observation, for the last time, as it proved, on board the *Delphine*. The wind then veered round to the south, and we believed ourselves sure of a speedy termination to the voyage, when, without any warning, it chopped round to the north-east, bringing its attendant fog. We were steering our course by computation, when in the night of the 19th, a few hours before daylight, we were suddenly awoken by the frightful grinding of the ship's keel upon the rocks. 'Land, land!' cried out the second mate; and in an instant every one, crew and passengers, was on the deck. On all sides the vessel was surrounded by rocks and breakers, while through the gloom the outline of high land was visible at a distance, exaggerated by the obscurity, and adding to the terrors of the moment, which it would be difficult to describe. The ship was yet afloat, but the shock had been too severe to leave any hope that she would continue to swim: every instant we feared she was sinking under us. The passengers ran to the pumps, and the crew, by orders of the captain, flew to the rigging. The pumps were soon dry, when, on hastening to the tiller, we found to our consternation that the rudder had been carried away. The ship struck again. We braced the yards round, to allow her to drift off the land, and cut the lashings which held the long-boat and yawl to the deck, during which time the grinding of the keel on the rocks became more violent than before, threatening the entire destruction of the vessel. We let go the best bower, in the hope of keeping her from drifting farther in; but the anchor dragged over the smooth rocky bottom. The water gained on us so fast, that we hastened to get the long-boat overboard; a work of great difficulty, as it dashed against the bulwarks with every roll of the ship, and endangered the lives of the men. At length we succeeded in getting her afloat; and, throwing in some provisions, we all jumped in, followed by the captain, who was the last to leave the deck. It was then five o'clock, and we waited for daylight among the rocks and sea-wrack, watching the ship, which at last struck on some rocks surrounding a small island. At daybreak we perceived a bay, towards which we rowed, and landed ourselves and the provisions on a sandy beach. The captain, with the sailors, returned immediately to the ship, to save, if possible, a greater quantity of provisions, and other matters necessary to our existence. They found her quite fast about half a mile from the place of our landing; all the between decks full of water, with the exception of the stern. They returned to the shore three hours afterwards, bringing the yawl, both boats laden with everything they could lay their hands on. A temporary tent was hastily set up, in

the centre of which a great fire was lighted; round this we spread some sail-cloth saved from the cargo, which served us for beds during the night. The two following days were passed in saving more provisions from the wreck, while a party who remained on shore got up another tent with the fore-sail, that had been brought for the purpose. A few days afterwards, a violent squall drove the long-boat on the rocks and stove her in, which obliged us to haul her on shore, to prevent her entire loss.

A fortnight passed in this manner, the yawl replacing the long-boat in our visits to the ship, when the weather would permit. The captain took an observation, from which we learned that our position was in 49 degrees south latitude, upon an island two leagues in length, separated by a narrow channel from the great island of Campana, as we ascertained from the English chart which the captain had taken the precaution to save, with his sextant and two compasses, on the first day of the wreck. Everything conspired, unfortunately, to render a long abode in this dreary region inevitable—the winter just commenced, the continued northerly winds of the season, and the distance which separated us from any settlement of Europeans. We calculated that our stock of biscuits and flour would last nearly four months, and determined that our wisest course would be to wait until the bad season was over, before venturing to seek for assistance in the long-boat, which by that time, as was proposed, would be repaired and decked in.

The captain did not forget that, in our present circumstances, the preservation of the health of the men from the inclemency of the climate was the first duty. Another tent was built with the mainsail, of greater dimensions than the former, in which the beds were so arranged as to be at some distance above the surface of the ground. The spot fixed on for the erection was the entrance of a wood which overlooked the whole bay, and in the first days of July* we took possession. The old tent was left standing, in which, although the materials at our disposal were very scanty, we managed to build an oven.

Certain unequivocal indications had led us to believe that the island was occasionally visited by savages. We had seen in different places a rude kind of hut, constructed of branches of trees, in which we found the remains of shell-fish and the bones of animals. Shortly after we entered on our new habitation, the captain's dog, which had been saved along with us, growled all night in spite of our efforts to pacify him. We were all on the alert the next morning on learning that the prints of naked feet had been seen on the sand: none of our party went barefoot, and the traces were those of persons running from the wood where our tent was situated. This circumstance led us to suspect that we were watched; and indeed, on the 9th July, while our party had gone on the usual salvage trip to the wreck, one of the passengers who had wandered to a distance returned hastily, telling us he had seen the savages. We armed ourselves immediately with all the offensive weapons within reach; and the captain, having advanced with a few men, soon came in sight of what he was in search of. There were nine of them, unarmed, their only clothing being the skin of a seal hanging over their back. At first they hesitated to move; but seeing that we approached with friendly demonstrations, they became familiar. We gave them some presents; but prevented their going to our tent, which they seemed greatly to desire. After staying a short time they left us, but soon repeated their visit, bringing with them their wives, whose clothing did not differ from that of the men. Subsequently, we permitted them to enter our tent, and went several times to visit them upon the different islands to which they transport themselves in canoes. Their huts were similar to those we had seen in our island, but were covered with skins. These savages are generally of middling height, strong,

and well formed. They are evidently the same race as the Indians of Chiloe, and are always accompanied by great packs of dogs, which they use for hunting seals, on whose flesh, with occasional supplies of shell-fish, they principally subsist. This food, however, often fails them in rough weather, when their canoes cannot put to sea. In their visits to us they were always asking for food, which was most probably their principal object; at the same time they often stole some of our things without being detected. In short, they appeared to us to be very miserable, and lazy to excess. The wreck of the *Delphine* was a fortunate event for them, as they picked up many articles floating about among the rocks.

During the earlier period of our residence on the island our time passed in a very uniform manner. The shore party provided wood for the fire, of which the consumption was indispensably great, on account of the continued rainy weather, and for the prevention of sickness. Another party was regularly employed with the yawl in saving things from the wreck. Our young lieutenant, Lepine, took charge of this laborious duty, and, by his zeal and activity, sustained the courage of the sailors both on the ship or among the islands after she was broken up. Meantime the month of September drew on. The carpenter had finished the repairs of the long-boat, which was covered with a deck, and rigged as a schooner, as well as was possible in our state of privation. Although the weather remained unseasonable, we always hoped it would change for the better. The captain, however, resolved on putting his project into immediate execution—to sail with a few men for San Carlos of Chiloe, to seek the means of rescuing the whole party from their perilous situation. The necessary preparations were made in consequence, and on Tuesday the 3d September our little vessel was launched, in order to be ready for the first favourable wind. But what was our disappointment when we saw that she filled with water before our eyes. We tried at first to stop the leaks while she was afloat; but this being impossible, we were compelled to haul her again on shore, where we took away a portion of the lining, and carefully examined the seams, and then caulked and stopped every chink by which it was possible the water could enter; and on Saturday evening, at high water, she was again launched. The next day we found her again half full of water; for her timbers were old and crazy. The captain, however, persisted in his resolution, and gave orders for her to be baled out—replying to those who expressed uneasiness that the wood would swell up in the water. A quantity of sail-cloth was used for ballast, which at the same time served for beds, although, in order to prevent their complete soaking, the baling was kept up incessantly. The provisions, calculated for eight days, with wine and spirits, were put on board; and a generous allowance of wine was given at dinner to the master and four men who were selected to accompany the captain and Lieutenant Lepine. At two in the afternoon they set sail, with fine weather and a stiff breeze from the south.

Seven of our number had left us; thirteen remained behind. We watched for a long time, from the top of the cliffs and rocks, the departure of our companions in misfortune, on whom our fate depended. The day was far advanced when we lost sight of them, and we returned to our tent with a feeling of sadness, justified by our actual position; for, leaving out of sight the probability of the loss of those who had gone away—an event but too possible—how much was there, in our own position on the island, to give cause for uneasiness. Was it not to be feared that the savages, who, until then, had been inoffensive, would become emboldened on seeing our diminished number; and that their greediness, or possibly want alone, might lead them to attack us, and take by force our little remaining provisions, as well as other things in our possession which had excited their cupidity? These reflections, however, were soon banished by the majority of our little band. Those who

* A winter month answering to the January of Europe.

had drunk farewell to their companions in a pitcher of wine, were not sorry to drink a few more bumpers to their prosperous voyage: conviviality, in short, was the prevailing feature of the moment, when an unexpected incident drew us all out of the tent. A small hut, built of wood and moss by one of the sailors and a passenger, not far from our tent, had taken fire, and was nearly consumed, with all its contents, before we could succeed in putting it out. This event finished the day, and each one threw himself, dispirited and melancholy, on what was called his bed.

Next day, nothing else was thought of but what was best for us to do under our present circumstances. Just before the departure of the long-boat, the daily ration for each man was eight ounces of biscuit. At this rate our stock would not last more than three weeks, and we could not expect to be released at least before a month. We therefore reduced our allowance to six ounces, and of wine one quart a-day. We had a great quantity of spirits, and were thus enabled to continue the usual allowance to the sailors. In this way we hoped to go on for more than a month. The savages came to visit us as before, and soon saw our diminished strength; but their demeanour towards us did not alter. The first thing they did whenever they landed was to come and warm themselves at our fire, so that we were careful to leave some one to keep guard when we went out to fish.

The month of September went by; our biscuit diminished rapidly; we reduced the ration to four ounces a-day. Towards the middle of the first week of October we began to feel uneasy. We remembered that, on the third day after our companions sailed, a heavy gale had set in. Was it not to be feared that they had perished? And, without taking the worst view, it was still possible that the captain might not find the expected succour at Chiloe. In this case, as our abode on the island would be lengthened, we decided on another reduction of our ration of biscuit to two ounces; just sufficient for a little daily sop. We succeeded in making the savages understand that, if they brought us food, we would repay them with the things they most desired; from which time they began to bring us the eggs of sea-fowl. Thus we went on until the middle of October, the sixth week since the long-boat sailed. Our anxieties now augmented, and many of us began to think of the means for our own rescue.

We had already, as a precautionary measure, collected the planks and pieces of wood of the shattered vessel. The idea occurred to us of constructing a boat capable of carrying the whole party, and we recommended to those who went out fishing to bring in the masts, yards, planks, or other portions of the wreck which they might find floating. By this means a great quantity of materials was collected; and the carpenter began to work upon the keel, which was thirty feet long.

On the 15th October our little ration of two ounces of biscuit failed us entirely, and we were reduced to the indifferent shell-fish, and the eggs—which were almost always added when the savages brought them to us—and to some birds which we occasionally killed. We wished the natives to bring us some of the flesh of the sea-wolf, which we had seen them eat; but whether the season was unfavourable, or they caught no more than sufficient for themselves, we could never obtain any. They gave us some dogs, and appeared greatly astonished when they saw that we had eaten them; for, notwithstanding the repugnance of some among us to eat dogs' flesh, our hunger was so great that we devoured them all. At the end of October we had ceased to hope, except in ourselves. Some of us were always occupied in seeking for wood or food; while the others were as persevering in their labours on the vessel, which went on very slowly, as much from the weakness to which our privations had reduced us, as from the bad weather which often prevented our working, and the want of proper tools. Thus the time wore away until the middle of November, all of the party suffering more or less from

attacks of dysentery: still, in spite of the continual rain and prevailing humidity, and the want of shoes, no one was so ill as to be detained in the tent. The hope of eventually succeeding in our efforts to escape from this dreary life supported our courage. We could see that, although slowly, our vessel approached completion: the slips, with the necessary inclination for the launch, were securely placed; the head and stern-posts were fixed on the keel; the greater portion of the ribs were made, and we cut others every day in the woods, to complete the number.

If we were deceived in the hope of saving ourselves, and in the means for its prosecution, the resolution of attempting it never failed us. Such was our situation when, on the morning of the 12th November, we heard a sailor who had just left the tent cry 'Sail, ho! sail, ho!' with all his might. Although this same sailor, deceived by a false appearance, had raised the same cry a month previously, we all ran precipitately towards the shore. This time the report was not false; we saw a vessel anchored in the bay. A heavy shower prevented our seeing distinctly, but we thought she belonged to some ship of war. The yawl was afloat in a moment, and a few men jumping in, were soon on board, not the boat of a man-of-war, but a *lanche* of San Carlos. Those on board of her were not strangers; they were Captain Coisy, Lieutenant Lepine, our sailors and companions, who came to deliver us and bring us provisions. It would be useless to dwell on the universal joy that prevailed, and the eagerness with which both parties inquired about what had transpired.

The long-boat had left the island on the 6th September in so leaky a condition, that two men were constantly engaged in baling; during the first night the sea broke over her repeatedly, threatening to carry all to the bottom. On the fifth day they passed Cape Taitachoun, and intended to double the island lying to the north of it, but were prevented by a gale, which obliged them to lie to for better weather. After some days, alarmed by the diminution of their provisions, they made sail, keeping as near their course as the wind would permit, and two days afterwards entered the great channel which separates the Chonos Archipelago from the Cordilleras. Thus they continued, with alternations of fair and foul weather, sometimes rowing, at others driven back, or landing to collect shell-fish for food, for twelve days, when one afternoon they saw smoke at a distance, to which they immediately directed their course, taking precaution to look to their arms, for fear of savages. The smoke was found to rise from a fisherman's fire, who, as soon as he understood their critical situation, set off to fetch provisions from his *caza*, three leagues distant, while they waited his return. After this they crossed to the islands of the Chiloe group, at one of which, marked Valasco Port, they were detained nine days by stress of weather, and were driven back in another attempt to cross the channel: but on the 3d October they again set sail, and on the 4th happily arrived at Chiloe, where they landed, for the purpose of procuring provisions at the first inhabited spot they saw. On the 10th, thirty-five days after their departure from our island, they reached San Carlos, having had incessantly rainy weather during the whole of this perilous voyage.

The captain lost no time in his endeavours after his principal object; the consular agent gave him all the assistance in his power; but, unfortunately, no ship of war or merchant vessel was lying in the port; there were only the miserable *lanches* of the country, quite unfit for such a voyage as that to the place of our detention. Everything in the shape of a vessel was examined, in the hope that one might prove serviceable, but in vain. The captain then heard of a large and commodious *lanche* at a place twenty-five leagues higher up the channel, and, without a moment's delay, he took a whale-boat and started for the settlement indicated; but what was his disappointment to find, on arrival, that the vessel was yet on the stocks, and only half completed.

He returned immediately to San Carlos, and determined, as nothing better was to be had, to hire a *lanche* in good condition which had arrived during his absence. This kind of vessel, which is used only for the transport of wood or potatoes from one island to the other, is not decked, and a deck for the voyage to the open sea was indispensable. In spite of all the diligence that could be used, it was the end of October before she was ready. Provisions for two months, in the meantime, had been collected, with the consul's assistance; and on the 30th, the captain, with the lieutenant and four men, sailed from San Carlos in the *lanche*, which had been rigged as a lugger. The master was left behind, as fatigue and privation had rendered him incapable of undertaking the return voyage: the others embarked, confiding in the generous hope of saving their companions. They took a whale-boat in tow, for convenience in landing; but, after beating about among the islands for some time, when they reached the open sea it laboured so much that the seams opened, and they were compelled reluctantly to cut it adrift. Finally, after repeated delays, vexations, and dangers, they recognised the approaches to our island, and at seven in the morning of the 13th November, as already described, they were at anchor in the bay.

The unexpected return of the captain, after seventy-three days' absence, when we thought him lost, placed us immediately in a state of abundance as regarded provisions; but we were not the less desirous of quitting a place where we had been so long detained in spite of ourselves. It was impossible, however, to go off in the teeth of the north wind, and we were obliged to wait three weeks for a favourable change. On Thursday the 3d December we sailed at three in the afternoon, towing our yawl, whose preservation had cost us so much labour. We did not keep it long, for when off Cape Taitachoun it broke loose, and drifted away in a squall. This was a serious misfortune, as it deprived us of the means of going on shore to cook our provisions, and of the chance of escape in case of wreck. The squall was the precursor of a furious gale, from which we incurred the greatest danger; the waves breaking over us from stem to stern, and pouring down into the confined space below, where we were crowded one on the other. Our situation was indeed a terrible one. We had given up all hope of safety, and resigned ourselves to the worst, when the storm began to moderate. We were quite uncertain as to our position, and steered for some land that was in sight: but what was our astonishment to find, when we drew near, that it was the island from which we had so recently sailed. We must have drifted sixty leagues during the four days that the gale continued. In our present circumstances, we were glad to re-enter a place we had so much desired to quit eight days previously. Having lost the yawl, we were forced to make a raft, which we drew from the shore to the *lanche*. The savages had not, as we feared, destroyed our tent; it was still standing. The miserable creatures had dug up the potatoes which we planted, with the view of leaving them a resource in the article of food. We divided our party: one half went every night to sleep on board the *lanche*, as a measure of precaution. The weather seemed to grow worse as the season advanced. We were covered with vermin, and dreaded that we should again be without provisions. On the 2d January 1841, the weather moderating, we were enabled once more to put to sea. No sooner had we cleared the bay than a heavy sea broke our rudder, and forced us to lie to. We secured it as well as possible with lashings, which quickly wore out and snapped. We then cut a few fathoms off our small chain, with which we secured the rudder from further danger. The weather continued stormy; but as the wind was in our favour, we shortly after passed the peninsula of Tres Montes; and once among the islands, we looked upon ourselves as saved.

After this we had fine weather. On the 14th, we

landed for fresh provisions, of which we were in great need; and on the 20th, to our great joy, we arrived at San Carlos, eighteen days after our last departure from the island, and seven months and one day from the date of the wreck. We had great reason to congratulate ourselves that, during this long period of privation, suffering, and danger, not one of the party was lost. The captain had neglected nothing in his power to prevent such a misfortune, not only while we were on the island, but in moments of danger, never hesitating to expose himself the first to whatever might happen. To his courage and perseverance must be attributed the success of his great object—the safety of all.

On our arrival at San Carlos, the French consul, M. Fauché, who had so generously assisted the captain on his former visit, hastened to supply our wants. To him were we indebted for the means of pursuing our voyage, and eventually returning to our native country.

OLD MONUMENTAL FIGURES IN CHURCHES.

In old churches, particularly those in country parishes, may often be seen figures in stone or marble, reclining on monumental sarcophagi. Sometimes the figures represent females—old ladies in ruffs and farthingales—but more frequently males, and generally chieftains, in some kind of armour. Ordinary observers are for the most part puzzled with respect to the degree of antiquity of these figures, but the archaeologist is acquainted with certain marks and appearances which guide him pretty surely to the era of their execution. There are few persons who do not feel an emotion of pleasure at beholding an object of art which has existed for ages; and that pleasure is increased tenfold when he is able to ascertain some circumstance connected with it—such as the time at which the monument was raised, the station or degree of the person whom it is meant to commemorate—when the record of such facts has been obliterated by time. To guide the lingerer in old churches to this sort of knowledge, we request his attention to the following facts.

Antiquaries have ascertained that monuments of the earliest date are stone sarcophagi, the top formed prism-shaped, like the sloping roof of a house, for the purpose of allowing wet to run freely off; for they were always placed in the open air. Such very ancient monuments are without inscriptions, their form being the only guide to their probable date. It appears that it was not till the year 1160 of the Christian era that these stone coffins with prismatic roofs began to be ornamented. From that period, carvings, chiefly of a grotesque character, but occasionally of armorial bearings (adopted at the beginning of the twelfth century), appear on them. These are the earliest specimens of sculpture; but they rise in excellence, completeness, and beauty, as the dates advance. The sloping roofs gradually disappear with the progress of sculptured emblems. Not content with merely carving the cover of the monument itself, figures were cut separate therefrom, and the roof flattened for them to be laid on it. This state of art seems not to have been arrived at till the thirteenth century, so that the spectator may be sure that a monument with a flat top is not of greater antiquity than that period, whether supporting an effigy or not. Of figures, there are various kinds. Those which have their hands laid on their breasts, with chalices in them, denote that the person commemorated was a priest. Prelates are always represented with their insignia—pontificals, croziers, or mitres. Knights, again, are to be known by their armour. Most of them are lying flat on their backs, and several with their legs crossed. In this case they have been either crusaders (from *cruz*, a cross) or married men; beside the latter, a statue of the wife is sometimes laid. The various descriptions of armour by which the effigies of ancient military men are covered, are sure guides to the era of their existence. Warlike figures of the earliest date are

found in tegulated or scale armour, like that of William Longspèe, Earl of Salisbury (son of Henry II. by Fair Rosamond), in Salisbury cathedral, who died in 1227. Chain armour, or mail composed of small iron rings, is seen on figures of later date, extending from the reigns of Richard Cœur de Lion to that of Henry III. A specimen of this kind of armour may be observed in Hitchendon church, Buckinghamshire. Plate armour seldom appears on knightly effigies more ancient than the latter reign. Female figures adorned with a mantle and a large ring, though they afford no clue to a date, denote that the deceased had taken the vow of chastity. Armorial *quarterings* of arms annexed to tombs show them to have been raised subsequently to the fourteenth century; while supporters were not adopted till Richard II.'s time.

At a later period, arches were raised over sepulchres, to protect them from the weather; but gradually, sepulchral monuments were removed within doors, and built in churches. In process of time, it was found that these arched monuments took up too much room, even in the most spacious cathedral. To lessen this evil, a plan was devised which gave rise to the practice of annexing chapels to the churches, expressly for containing such mausoleums. These chapels are in many instances only separated from the main body of the building by iron rails, and are entered by doors from the side aisles. This practice was not commenced till the fifteenth century.

Even figures in the ordinary sculpture, or half-relief, multiplied so much that a less elaborate mode was at an early period adopted as mementos of individuals. This was by simply engraving or incising the effigy on slabs or on brass plates. Amongst the earliest recorded instances in England may be mentioned the tomb of Jocelin, Bishop of Wells, placed by him during his lifetime in the middle of the choir, and described by Godwin as formerly adorned with a figure of brass. He died in 1242. The date of the earliest existing specimen is about 1290; it is the figure of Sir Roger de Trumpington, who accompanied Prince Edward in the holy wars, and is represented with his legs crossed. An interesting addition, hitherto unnoticed, has recently been made to the small list of sepulchral brasses of this early period, which represent knights in the cross-legged attitude; it is preserved in the church of Pebmarsh, near Halstead, in Essex.*

Although recumbent effigies continued to be either sculptured or engraved on tombs till the seventeenth century, yet other devices were meantime adopted. Immediately after the Gothic ages of chivalry, more solemn emblems of mortality were employed than effigies—whether knights or priests—attired in 'their habits as they lived.' Skeletons in shrouds began to be used in the fifteenth century; and these were succeeded by corpses (generally portraits) in shrouds, with the head bound up, and the feet tied. Sometimes images of children were placed at the feet; and cherubim figured at the corners of the tomb. The most remarkable of these tombs have, as it were, two storeys; in the upper one lies the shrouded corpse, whilst the lower compartment contains a skeleton or emaciated human body. Such sepulchral devices, always unpleasant, even when well executed, were chiefly adopted for ecclesiastics.

Besides the different effigies, and the clothing they are represented in, together with the other various ornaments carved upon tombs, the antiquary is guided to the date of their erection, and to the status of the person they were designed to commemorate, by the situations in which they are found. The most important class of sepulchres were those of saints, and other holy persons, who, on account of the great veneration in which they were held, were 'enshrined,' the shrines being usually placed on the east of the altar, though, when numerous, in any convenient part of the church. According to the sanctity of the deceased, so were his remains ele-

vated above the ground. The bodies of unsainted men, of exemplary piety and mortification, were placed on a level with the surface of the earth; the coffins of saints of the second class rested on the flooring of the edifice; whilst the remains of martyrs were elevated. Effigies of saints, usually carved in wood, are placed above the shrine, to excite devotion. Monuments built up within the substance of walls are chiefly those of the founders of the chapel, or else of persons who had rebuilt that part of the edifice in which such mementos are found. Tablets or figures fixed *against* the walls, or let into the pillars of churches, did not come into use till after the Reformation. The actual burial-place of the founders of churches or chapels was the porch; for it was formerly the custom for worshippers, on entering the sacred edifice, to pray for the souls of its founders and benefactors. Thus Leofric, Earl of Mercia, and his celebrated countess, Godiva, were buried in the porch of the Abbey-church, Coventry, which they had founded. The heads of the religious houses were generally interred in their chapter-houses, or their cloisters; and rectors or vicars in the close vicinity of the altar, or in the chancel of the church to which they belonged. Lords of manors and patrons were often interred in the chancel, and sometimes within the rails.

The most obvious guides to the date of tombs are of course inscriptions. As, however, many of these exist without giving any information regarding the time at which they were cut, consisting simply of an epitaph, the following facts, taken in connexion with other evidences presented on the tomb itself, will lead to a near conjecture as to its age. During the first twelve centuries, churchyard epitaphs were all written in Latin; and the first inscribed funeral monuments are those bearing the names of Romanised Britons in Cornwall or Wales. These are written in capital letters; but a small hand was introduced about the seventh century. Lombardic capitals became general on tomb-stones in the thirteenth century, when epitaphs in the French language began to appear; which continued to be used till the middle of the fourteenth century, generally in German-text letters. From that period vernacular English and Roman print have been commonly employed for monumental inscriptions; though the clergy and learned have, as might be expected, always preferred the Latin.

THE WISE THOUGHT.

[From Sketches of Irish Character, by Mrs S. C. Hall.]

SHE was sitting under the shadow of a fragrant lime tree that overhung a very ancient well; and, as the water fell into her pitcher, she was mingling with its music the tones of her 'Jew's harp,' the only instrument upon which Norah Clary had learned to play. She was a merry maiden of 'sweet seventeen,' a rustic belle, as well as a rustic beauty, and a 'terrible coquette'; and as she had what in Scotland they call a 'tocher,' in England a 'dowry,' and in Ireland a 'pretty penny o' money,' it is scarcely necessary to state, in addition, that she had—a bachelor. Whether the tune—which was certainly given *in alto*—was or was not designed as a summons to her lover, I cannot take upon myself to say; but her lips and fingers had not been long occupied, before her lover was at her side.

'We may as well give it up, Morris Donovan,' she said somewhat abruptly; 'look, 'twould be as easy to twist the top off the great hill of Howth, as make father and mother agree about any one thing. They've been playing the rule of contrary these twenty years, and it's not likely they'll take a turn now.'

It's mighty hard, so it is,' replied handsome Morris, 'that married people can't draw together. Norah, darling! that wouldn't be the way with us. It's one we'd be in heart and soul, and an example of love and—'

'Folly,' interrupted the maiden, laughing. 'Morris, Morris, we've quarrelled a score o' times already; and a

* Archaeological Journal, No. 3.

bit of a breeze makes life all the pleasanter. Shall I talk about the merry jig I danced with Phil Kennedy, or repeat what Mark Doolen said of me to Mary Grey?—eh, Morris?

'Leave joking, now, Norry; God only knows how I love you,' he said, in a voice broken by emotion: 'I'm yer equal as far as money goes; and no young farmer in the country can tell a better stock to his share than mine; yet I don't pretend to deserve you for all that; only, I can't help saying that, when we love each other (now, don't go to contradict me, Norry, because ye've as good as owned it over and over again), and yer father agreeable, and all, to think that yer mother, just out of *divilment*, should be putting betwixt us for no reason upon earth, only to "spite" her lawful husband, is what sets me mad entirely, and shows her to be a good-for—'

'Stop, Mister Morris,' exclaimed Norah, laying her hand upon his mouth, so as effectually to prevent a sound escaping; 'it's *my* mother ye're talking of, and it would be ill-blood, as well as ill-bred, to hear a word said against an own parent. Is that the pattern of yer manners, sir; or did ye ever hear me turn my tongue against one belonging to you?'

'I ask yer pardon, my own Norah,' he replied meekly, as in duty bound; 'for the sake of the lamb, we spare the sheep. Why not? and I'm not going to gain-say, but yer mother—'

'The least said's the soonest mended!' again interrupted the impatient girl. 'Good even, Morris, and God bless you; they'll be after missing me within, and it's little mother thinks where I am.'

'Norah, above all the girls at wake or pattern, I've been true to you. We have grown together, and since ye were the height of a rose-bush, ye have been dearer to me than anything else on earth. Do, Norah, for the sake of our young hearts' love, do think if there's no way to win yer mother over. If ye'd take me without her leave, sure it's nothing I'd care for the loss of thousands, let alone what ye've got. Dearest Norah, think; since you'll do nothing without her consent, do think—for once be serious, and don't laugh.'

'I'm not going to laugh, Morris, replied the little maid at last, after a very long pause; 'I've got a wise thought in my head for once. His reverence, your uncle, you say, spoke to father—to speak to mother about it? I wonder (and he a priest) that he hadn't more sense! Sure, mother was the man; but I've got a wise thought. Good night, dear Morris; good night.'

The lass sprang lightly over the fence into her own garden, leaving her lover *perdu* at the other side, without possessing an idea of what her 'wise thought' might be. When she entered the kitchen, matters were going on as usual—her mother bustling in style, and as cross 'as a bag of weasels.'

'Jack Clary,' said she, addressing herself to her husband, who sat quietly in the chimney-corner smoking his *doodeen*, 'it's well ye've got a wife who knows what's what! God help me! I've little good of a husband, *barring* the name! Are ye sure Black Nell's in the stable?' The sposo nodded. 'The cow and the calf, had they fresh straw?' Another nod. 'Bad cess to ye, can't ye use yer tongue, and answer a civil question?' continued the lady.

'My dear,' he replied, 'sure one like you has enough talk for ten.'

This very just observation was, like most truths, so disagreeable, that a severe storm would have followed, had not Norah stepped up to her father and whispered in his ear, 'I don't think the stable door is fastened.' Mrs Clary caught the sound, and in no gentle terms ordered her husband to attend to the comforts of Black Nell. 'I'll go with father myself and see,' said Norah. 'That's like my own child, always careful,' observed the mother, as the father and daughter closed the door.

'Dear father,' began Norah, 'it isn't altogether about the stable I wanted ye, but—but—the priest said something to you to-day about—Morris Donovan.'

'Yes, darling, and about yerself, my sweet Norry.'

'Did ye speak to mother about it?'

'No, darling, she's been so cross all day. Sure I go through a dale for peace and quietness. If I was like other men, and got drunk and wasted, it might be in rason; but— As to Morris, she was very fond of the boy till she found that I liked him; and then, my jewel, she turned like sour milk all in a minute. I'm afraid even the priest 'll get no good of her.'

'Father, dear father,' said Norah, 'suppose ye were to say nothing about it, good or bad, and just pretend to take a sudden dislike to Morris, and let the priest speak to her himself, she'd come round.'

'Out of opposition to me, eh?'

'Yes.'

'And let her gain the day then?—that would be cowardly,' replied the farmer, drawing himself up. No, I won't.'

'Father, dear, you don't understand,' said the cunning lass; 'sure ye're for Morris; and when we are—that is, if—I mean—suppose—father, you know what I mean,' she continued, and luckily the twilight concealed her blushes—'if that took place, it's *you* that would have yer own way.'

'True for ye, Norry, my girl, true for ye; I never thought of that before!' and, pleased with the idea of 'tricking' his wife, the old man fairly capered for joy. 'But stay a while—stay; aisy, aisy!' he recommenced; 'how am I to manage? Sure the priest himself will be here to-morrow morning early; and he's out upon a station now, so there's no speaking with him; he's no way quick either; we'll be bothered entirely if he comes in on a sudden.'

'Leave it to me, dear father—leave it all to me!' exclaimed the animated girl; only pluck up a spirit, and whenever Morris's name is mentioned, abuse him—but not with all yer heart, father—only from the teeth out.'

When they re-entered, the fresh-boiled potatoes sent a warm curling steam to the very rafters of the lofty kitchen; they were poured out into a large wicker kish, and on the top of the pile rested a plate of coarse white salt; noggins of butter milk were filled on the dresser; and on a small round table a cloth was spread, and some delf plates awaited the more delicate repast which the farmer's wife was herself preparing.

'What's for supper, mother?' inquired Norah, as she drew her wheel towards her, and employed her fairy foot in whirling it round.

'Plaguy *snipeens*,' she replied: 'bits o' bog chickens, that you've always such a fancy for; Barney Leary kill them himself.'

'So I did,' said Barney, grinning; 'and that stick wid a hook, of Morris Donovan's, is the finest thing in the world for knocking 'em down.'

'If Morris Donovan's stick touched them, they shan't come here,' said the farmer, striking the poor little table such a blow with his clenched hand, as made not only it, but Mrs Clary jump.

'And why so, pray?' asked the dame.

'Because nothing belonging to Morris, let alone Morris himself, shall come into this house,' replied Clary; 'he's not to my liking anyhow, and there's no good in his bothering here after what he wont get.'

'Excellent!' thought Norah.

'Lord save us!' ejaculated Mrs Clary, as she placed the grilled snipes on the table, 'what's come to the man?' Without heeding his resolution, she was proceeding to distribute the savoury 'birdeens,' when, to her astonishment, her usually tame husband threw the dish and its contents into the flames; the good woman absolutely stood for a moment aghast. The calm, however, was not of long duration. She soon rallied, and commenced hostilities: 'How dare you, ye spalpeen, throw away any of God's mate after that fashion, and I to the fore? What do you mane, I say?'

'I mane, that nothing touched by Morris Donovan shall come under this roof; and if I catch that girl of

mine looking at the same side o' the road he walks on, I'll tear the eyes out of her head, and send her to a nunnery!

'You will! And dare you to say that to my face, to a child o' mine! You will, will ye?—we'll see, my boy! I'll tell ye what, if I like, Morris Donovan *shall* come into this house, and, what's more, be master of this house; and that's what you never had the heart to be yet, ye poor ould snail!' So saying, Mrs Clary endeavoured to rescue from the fire the hissing remains of the burning snipes. Norah attempted to assist her mother; but Clary, lifting her up, somewhat after the fashion of an eagle raising a golden wren with its claw, fairly put her out of the kitchen. This was the signal for fresh hostilities. Mrs Clary stormed and stamped; and Mr Clary persisted in abusing not only Morris, but Morris's uncle, Father Donovan, until at last the farmer's helpmate *swore*, ay, and roundly too, by cross and saint, that, before the next sunset, Norah Clary should be Norah Donovan. I wish you could have seen Norry's eye, dancing with joy and exultation, as it peeped through the latch-hole; it sparkled more brightly than the richest diamond in our monarch's crown, for it was filled with hope and love.

The next morning, before the sun was fully up, he was throwing his early beams over the glowing cheek of Norah Clary; for her 'wise thought' had prospered, and she was hastening to the trysting tree, where, 'by chance,' either morning or evening, she generally met Morris Donovan. I don't know how it is, but the moment the course of true love 'runs smooth,' it becomes very uninteresting, except to the parties concerned. So it is now left for me only to say, that the maiden, after a due and proper time consumed in teasing and tantalising her intended, told him her saucy plan, and its result. And the lover hastened, upon the wings of love (which I beg my readers clearly to understand are swifter and stronger in Ireland than in any other country), to apprise the priest of the arrangement, well knowing that his reverence loved his nephew, and niece that was to be (to say nothing of the wedding supper, and the profits arising therefrom), too well, not to aid their merry jest.

What bustle, what preparation, what feasting, what dancing, gave the country folk enough to talk about during the happy Christmas holidays, I cannot now describe. The bride of course looked lovely, and 'sheepish'; and the bridegroom—but bridegrooms are always uninteresting. One fact, however, is worth recording. When Father Donovan concluded the ceremony, before the bridal kiss had passed, Farmer Clary, without any reason that his wife could discover, most indecorously sprang up, seized a shillelah of stout oak, and, whirling it rapidly over his head, shouted, 'Carry me out! by the powers she's beat! we've won the day!—ould Ireland for ever! Success, boys!—she's beat, she's beat!' The priest, too, seemed vastly to enjoy this extemporaneous effusion, and even the bride laughed outright. Whether the good wife discovered the plot or not, I never heard; but of this I am certain, that the joyous Norah never had reason to repent her 'wise thought.'

LIBERATED CRIMINALS—WHAT SHOULD BE DONE WITH THEM?

A CORRESPONDENT of the Glasgow Herald newspaper calls public attention to the distressing fact, that short confinements of young criminals, even under a good system of prison discipline, are of little or no avail, and that, generally speaking, they do not stop in their career till transported. After mentioning six cases in particular, he proceeds:—'Here are the cases of six young persons (the number might as easily have been sixty), little more than children, every one of whom had undergone various terms of imprisonment prior to the committal of the last offence for which they have all been transported. In two cases, the ages are respectively thirteen and fourteen, and the periods of imprisonment that these children have undergone are twenty-four months and twenty-nine months, so that they could not be more than eleven years of age, if so much,

when they were first convicted. In addition to other and shorter periods of confinement, each had been imprisoned for one term of eighteen months, and being very young, everything was in favour of their being so far improved by prison discipline, as to resort to some honest means of livelihood on their liberation; instead, however, of this being the case, we find them again pursuing a career of crime, and being at last transported, though but thirteen and fourteen years of age.

'At first sight, one is almost inclined to draw the conclusion that prison discipline is of no avail, and that the hopes of the benevolent, who have laboured so long and so effectually in the amelioration of the condition of criminals, can never be realised. A little reflection, and an examination of the cases given above, will show that such an inference is not altogether warranted, and that the requisite opportunities have not yet been afforded for the full development of the results of the mild and humane treatment at present being pursued in our prisons. It will be observed that, in every case, shorter terms of imprisonment have been awarded before the criminals have been sentenced to such a lengthy period of confinement as would warrant hopes of reformation, and the necessary consequence of these repeated short imprisonments is so to habituate the prisoner to a life of confinement, as to deprive imprisonment of its chief power as a means of punishment; whilst the frequent liberation of a criminal unreformed, his reunion with his former associates, and his recurrence to a course of crime, all tend to deaden any trifling sense of morality that might have remained; make him more and more callous to remonstrance, and remove, almost beyond the bounds of probability, the hope of effectual reformation. Short imprisonments, as means of reformation, are worse than useless; they are positively injurious, as they deprive the unfortunate offender of any little chance he might have had of personal amelioration, whilst they cause him to be regarded with the same abhorrence as a longer term of confinement.

'Another, and perhaps not less powerful prevention of the good looked for from the present educational and moral treatment in prisons, is the necessity that liberated criminals are under of returning to their former places of residence, in search of employment, if willing to work, or in some other way to obtain a livelihood. So long as no means are provided for removing prisoners, after a long imprisonment, from the places where they are well known, where many of their former companions still reside, and where persons are always ready to re-entice them into a criminal course, and to profit by their turpitude, so long will it be next to hopeless to look for any extensive good from prison discipline, however excellent; and so long will our calendars of crime be swelled by the same persons again and again, and judges be called upon to perform their solemn duties upon criminals formerly sentenced by them. In fact, the necessity for some additional means of reformation is becoming every day more and more evident, and either more prisons must be built for the punishment of offenders, or other institutions must be erected for rendering their reformation permanent.

'Two measures appear to us as imperatively necessary in order that crime may be prevented, and criminals reformed. The precise means of accomplishing these measures, we, of course, leave to others better able to carry such plans into operation. We think that, instead of committing juvenile offenders to a prison for a short term of imprisonment, where their characters will be for ever blasted, and the hopes of reclamation almost destroyed, that magistrates should have the power, with the concurrence of the natural guardians, to send such young offenders to a house of refuge for a long term, say two or three years, where the knowledge of some useful occupation may be acquired without the taint of a prison attaching to the character; and, as many of these juvenile offenders become criminal through destitution, means should be employed to educate them, and train them in industrious pursuits, which could also be done in a house of refuge, taking care to classify the merely destitute and criminal inmates. The expense of such an institution should not devolve upon one locality, as the good would be general; nor do we think that, ultimately, the charge would be so great as all the cost of imprisonment and transportation to which most of these become subject at last. The other great measure that we think the present state of things calls for is, the adoption of some plan by which criminals, after a long term of imprisonment, who may have evinced a desire to change their

former mode of life, may be preserved from the necessity of returning to the scene of their former crime and shame.

In these humane and considerate observations we cordially concur. It should be the object of the magistracy to seize upon, retain, and thoroughly discipline the whole criminal population—the number of which is not great in each locality—and thus rid society of their presence. But this will not be enough. Society, we fear, will be baffled in every scheme to prevent the recurrence of crime in juvenile offenders, till it puts these offenders in the way of earning an honest livelihood on leaving the place of their confinement, whether that confinement be long or short, harsh or kind, good, bad, or indifferent. A plan having, to a certain extent, such an object in view, has been lately proposed by a benevolent gentleman in Birmingham. The scheme consists in each master engaging to receive back into his employment juvenile offenders who have undergone a term of correct prison discipline. We can only wish the measures which are adopted all the success they deserve.

TOBACCO MANUFACTORY OF SEVILLE.

Not the least among the curiosities of Seville is the tobacco manufactory. Tobacco is one of the royal monopolies, and it is manufactured in a palace. A very cursory glance at this singular establishment, will afford some idea of the great value of this monopoly. It is a noble and stately edifice, of a quadrangular form, 600 feet in length by 480 broad. It is surrounded by a moat, and approached by a drawbridge, like a regular fortification. Soldiers are continually on duty at the entrance and in the courts; all the workpeople are carefully searched every night on leaving the establishment, and no cloaks are permitted within its precincts—all precautions against the abstraction of the precious weed. It employs no fewer than 5000 hands. Of these, 3000 are women; almost all of whom are employed in twisting cigars. Of the 2000 men, a great proportion are similarly occupied; while a considerable number are employed in the manufacture of all the different articles and implements which are required in the establishment. Women are preferred for the manufacture of cigars, as lightness and delicacy of touch are of importance in this branch of the business. Two immense halls are set apart for the cigar-twisters, one for the men and the other for the women. The largest of these, in which 3000 women are seated, busily engaged in rolling up the fragrant leaf, each with a little basket of bread and fruit beside her for dinner, presents a very extraordinary spectacle. The work is performed with amazing rapidity, and a single individual will roll up from 500 to 600 cigars per day. The time of labour is from 7 o'clock A.M. to 4 P.M. One part of the process is sufficiently disgusting, but out of consideration for the lovers of cigars, we refrain from mentioning it. We saw the whole process of manufacturing snuff. The tobacco-leaves are first steeped in a decoction of Brazilian tobacco, plums, walnuts, lemon-peel, &c.; the heart-stalks are then removed, and the leaves twisted into ropes, and coiled up in tight packages. These are pressed by a machine, not unlike a large cheese-press, and are then stored up for six or eight months to ferment. Afterwards they are uncoiled, and chopped into small pieces by a very clumsy set of hammers worked by mules. When chopped sufficiently, the tobacco is conveyed to the mill and ground into snuff. The stems and heart-stalks are, I believe, manufactured into a coarser article. When the wind blows in a particular direction, it is said that this establishment may be nosed at a league distant. There are five royal tobacco manufactories in Spain, of which this at Seville is the largest. The quantity of cigars consumed by this nation of cigar-smokers is prodigious. Spaniards are decidedly the greatest smokers in Europe. All Spaniards smoke, and all smoke cigars. The pipe is comparatively unknown. The cigar gleams betwixt the lips of the haughty noble and the poor muleteer. Like death, it levels all distinctions; all are alike subjected to its sway. It overpowers the odour of garlic in the poor man's hut, and mingles with the rich perfumes of the halls of the wealthy. Europe is indebted to America for tobacco and the potato, but tobacco has far outstripped her compatriot; and while the humble and nutritious root which brings plenty to the poor man's home is only gradually, and by dint of much pains and patronage, forcing its way in the world, the nauseous and unwholesome weed is chewed, and smoked, and snuffed in almost every part of the known world, and that

too in defiance of much opposition. The king of England wrote a book against it; the pope issued his bull against it; the magistrates of Transylvania punished its culture with confiscation; the king of Persia forbade it under pain of death; and the grand-duke of Moscow, under penalty of the loss of the nose! The last appears the most appropriate punishment. The progress of tobacco is, in fact, a singular phenomenon in the history of the human race; and proves how mankind will prefer the most disgusting and nauseous drug, provided it exert a narcotic or stimulating influence over the nerves, to the most nutritious and wholesome food, though as palatable as valuable. The history of tobacco, opium, and ardent spirits, is not very flattering to the dignity of human nature.—*Journal of a Clergyman, by the Rev. W. Robertson of Edinburgh.*

THE FORGET-ME-NOT.

[FROM THE GERMAN OF MÜCHLER.]

SILENT o'er the fountain gleaming,
In the silvery moonlight hour,
Bright and beauteous in its seeming,
Waves a friendly fragile flower.
Never let it be mistaken;
Blue—as heaven's own blessed eye,
By no envious clouds o'ertaken
When it laughs through all the sky.
Flower of heaven's divinest hue!
Symbol of affection true!
Whisper to the poor heart-broken
Consolation—heaven-spoken!
Loved one!—like the star of morning
Are thine eyes—so mild and fair—
Innocence with light adorning
Their pure radiance everywhere!
Maiden mine! attend my lay:
Be this flow'ret ne'er forgot—
Whispering through the far-away,
'Oh, forget—forget me not.'
Duty stern may bid us sever,
Tears bedew our parted lot;
Yet these flowers shall murmur ever,
'Ah, forget—forget me not!'
List, beloved! what it saith;
List each blossom's whispered sound!
As its lowly head it layeth
On the dew-besprinkled ground.
Bethink! each dewdrop is a tear,
That brims its dark blue eyes;
Remember—when you wander near—
'Forget me not' it sighs!

[The exquisite German legend of the origin of this humble flower's touching name, is known to many—perhaps not to all. A lover and his mistress were walking on the steep banks of a rapid river: the lady was struck by the beauty of a little flower, new to her, and growing on the sharpest declivity of the almost perpendicular bank. The veronica, according to some, the mouse-ear, as others say, was the plant, to obtain which for his beloved, the young man immediately sprang down the cliff to secure the treasure. At the moment when the prize was won, the earth gave way under the lover's tread, who, in the act of falling, threw the flower towards his mistress, uttering the words, 'Forget me not,' and was precipitated into the foaming current, which bore him many miles from the spot of the catastrophe. The body being found, was followed and borne to the grave by his affianced bride and her companions, arrayed in white, and scattering flowers of the 'forget-me-not' along their mournful path. This flower is a favourite subject among German poets.]—E. L.

THE EMPEROR OF RUSSIA'S FAMILY.

The lovely family of the Emperor Nicholas, consisting of four sons and three daughters, were brought up from the cradle by English nurses and governesses, under the superintendence of an old Scotchwoman, who was under-nurse to the present emperor in his infancy. This individual held the rank of a general officer (for everything in Russia is measured by a military scale), and had been decorated with the order of St Andrew, ennobled, and enriched. This woman, nevertheless, came as a servant girl to Russia, some five-and-fifty years ago, with a Scotch trader's family, who turned her adrift in St Petersburg. A lucky chance procured her the situation of under-nursery-maid in the Emperor Paul's family, when she was placed about the person of the present emperor, to teach him to speak English! His attachment to her was so great, that when he married, he placed her at the head of his nursery establishment, where she has honourably gone through all the military gradations of rank to her present one of general.—*Newspaper paragraph.*

Column for Young People.

You are fond of hearing your mamma tell stories; I will tell you a little story of two chickens that may perhaps amuse you. I live with my family in a large house in the country, at a good distance from any market-town, and therefore cannot on all occasions send out to buy things, as you are accustomed to see your parents do. Sometimes we are supplied with chickens by women who go about selling them, and as I like to see poor people honestly employed, I generally buy a chicken or two from them, even when we are not in immediate need of them.

Some time ago, a little girl neatly dressed came to the hall-door with a basket on her arm, in which were two chickens she wanted to sell. Her mother, she said, was in poor circumstances; she wanted money to buy some things that she stood in need of, and she had no way of procuring the money but by selling these chickens. I desired her to go round to the kitchen, and that, if the cook were pleased with them, they should be purchased. The poor girl replied that she had already been there, but that the cook had sent her away. On inquiry, I found that the chickens were considered not at all fit for the larder; being so very thin, that they were not worth the trouble of fattening. I suggested that they might be put in a coop, but the cook said they would die of cold; and when I hinted that they might run about the yard, she declared that the dogs would chase them and kill them. The cook had clearly set her face against having anything to do with the unfortunate chickens.

The poor chicken merchant was not altogether disconcerted with these resolutions. She eloquently pleaded the merits of the animals, and as a last resource, tried to enlist the children in her cause. Here she had no such critical judge to deal with as the cook. They were delighted with the appearance of the creatures. 'Oh, mamma!' cried Emily, 'there is one of the most beautiful chickens ever seen: see what a fine tuft one of them has got. You know you promised me a hen, and I will keep this for one, to lay eggs, if you will buy it for me. Oh, do mamma; pray do.' There was no resisting this appeal, particularly as I had the best of the bargain; so I looked at the little despised fowls, and saw that one of them was of the golden pheasant breed, with a crown of feathers on its head nearly as large as its body. The other was of the common kind of poultry, and not a very handsome specimen either; but it was settled that the ugly one was to be bought to keep the handsome one company, as we had no other chickens at that season of the year. So the bargain was made, the girl paid, and the chickens changed mistresses, apparently to the satisfaction of all parties; and the cook consented to keep Miss Emily's chickens in the kitchen, at least for a few days, to see how they behaved themselves; for I assure you there is a great difference in the dispositions of chickens as well as children. They proved to be very well-conducted for their age, were very tame, and never flew up on the dresser to break the jugs and plates; so the cook placed a little stick near the fire for them to roost on; and they picked about the kitchen all day, and in the evening the cook put a chair under the perch, and they jumped up, first on the seat, then on the back of the chair, and then made a fly to their roost, where they slept quietly side by side all night; and in the morning, when daylight came, they flew down, and just went on as the day before. They were indeed very good chickens, and soon won the regard not only of Emily, who was predisposed to love them, but of the cross old cook, with whom they became most particular favourites and companions. In short, in a few weeks you would not have known them to be the poor miserable little orphans that they were before Emily adopted, and the cook nursed them; and well they showed the cook's care, for they were fat and well-feathered, and comfortable to look upon.

I have now told you how fond Emily and the cook were of them, and the ugly one was just liked as much as the pretty one, although they called one 'the Beauty,' and the other 'the Waiting-maid,' for distinction. But now I have to tell you of the affection they had for each other; they, it appeared by the following account, made no distinction of rank or beauty either:—

One evening Beauty was on the perch alone; and so, after waiting for some time to see if the Waiting-maid would come in herself—for by this time they had extended their excursions to wherever they chose—the cook commenced looking for her, and, after trying the yard and out-

houses in vain, she inquired of every one if she had been seen lately by them. The only tidings she could obtain were, that the men who were thrashing had seen them both that day in the barn. The cook was in great tribulation, and so was Emily, as they both came to the conclusion that the dogs had chased and killed her; but just as the cook was putting the kitchen in order for the night, she discovered the poor little Waiting-maid sitting or rather lying in a corner, under the large table, quite unable to move. We supposed that she had been touched by a flail when in the barn, for she had no limbs broken, but she had lost the use of them, as if her back had got a hurt: we never could find out how she had contrived to come into the house afterwards. She was taken up tenderly, and placed on the roost. The next morning Beauty went forth alone. The Waiting-maid was quite helpless, and had to be waited on herself. Although the cook's friendship was difficult to obtain, yet, when once gained, it was very sincere, and to be depended on, which she proved in this instance; for she removed the invalid to her own room, which was boarded, and put her on the floor, with some hay to lie on, where she would not be annoyed by dogs, cats, or poultry, but could be perfectly quiet, perhaps too quiet; for, indeed, loneliness was all that she had any reason to complain of. But now a strange sight commenced; for Beauty—contrary to the usual customs of birds and beasts in general, which dislike those of their species who are sick or wounded, and often kill them—every morning, after she had taken a walk in the yard, came in, and making her way to the cook's room, sat down beside the Waiting-maid, where she remained all day; so that, one day happening to see them, I asked if Beauty was lame too; for she had her feet tucked up under her like the other, and sat there all day without stirring, until evening again, when she went out to air herself; and the moment the kitchen-door was opened for her, she ran to her sick companion, and sat beside her all night too, forsaking the perch altogether. For six weeks she tended her with the greatest diligence and care, invariably regular, and untired by the duty she had imposed upon herself. The good effects of sympathy and friendship soon appeared. The Waiting-maid began to look more cheerful and to pick a little after Beauty shared her sorrows; and she had the satisfaction in a short time to see her take a step or two along with her, and after that to go a little way into the yard with her. Invigorated by the fresh air, and a return to her natural habits, the Waiting-maid was in a week or two able to run about pretty smartly, and finally she had the power to fly up to her old perch in the kitchen. In these movements Beauty always attended the Waiting-maid as if delighted to see her well and happy. Now, they go on together as if no accident had occurred, reposing every night on the perch, to the great delight of Emily and the cook; and I suppose when Beauty lays her first egg, there will be as much rejoicing over her as there was over Barney Brady's goose.

Now, from the conduct of these little chickens two lessons may be learned. In the first place, their good conduct and civil deportment procured them kind friends, who aided them in their necessities. For it is not when we are in need of friends that we must make them; no, that is the time to prove the sincerity of their friendship. The second lesson is to be taken from the example of little Beauty, who was not only so affectionate and kind a nurse to her companion, but also never got tired of her occupation all the time that it was necessary. Now, I know that young people are not fond of being with those who are sick, and soon grow tired of attending them, and think it very wearisome to stay in a sick room. I would wish to know, when it is their turn to be sick, how they would like all their playfellows to go from them, and never come near or stop with them. They should remember to do as they would wish to be done by; and not only for a selfish reason would I wish them to consider their conduct, but, as their heavenly Father is merciful and good to them every day and every hour, they should also try to do all in their power to relieve the wants, and alleviate the sufferings of their fellow-creatures; and if they are neglecting their duty in this respect, I would admonish them to remember Beauty.

* * Complete sets of the Journal, First Series, in twelve volumes, and also odd numbers to complete sets, may be had from the publishers or their agents. A Stamped Edition issued for transmission, post free, price Two-pence halfpenny.

Printed by William Brindley, of No. 6, York Place, and Frederick Mallett Evans, of No. 7, Church Lane, both of St. Andrew's, in the county of Middlesex, printers, at their office, Lombard Street, in the precinct of Whitechapel, and also of London; and Published (with permission of the Proprietors, W. and R. CHAMBERS,) by WILLIAM SOMERVILLE (GKN. Publisher, of R. Amen Corner, at No. 2, ABERNETHY CORNER, both in the parish of St. Andrew's, and in the city of London.—Saturday, May 10, 1856.

A VISIT TO BIRKENHEAD.

A TIME of vast mechanical means like the present has its sublimities as well as the earlier ages of the world. A Liverpool millionaire said one day not long ago to a meeting of Perthshire proprietors, 'Unless you do so and so, I'll take my railway by the east of Fife.' Consider what a railway is, and say if Wolsey's 'Ego et Rex' was a grander thing for a subject to speak than this? About the same time, another great railway hero—a man who a few years since was a shopkeeper in York—was commissioned by a set of brother directors to accomplish a particular object for the general interest, and two millions were placed at his disposal for the purpose. 'Take that sum,' they told him, 'and make the best of it.' Alexander's passage of the Granicus with a handful of hardy Greeks was no doubt a fine thing; but there is as much of the grand, in its own way, in what many English merchants are doing every day. Talk of utility as having overpowered the poetical with us! On the contrary, the world has never seen or known a poetry like what a right spirit can trace in hundreds of the facts by which we are now surrounded.

One of the facts of this kind which have most deeply impressed us lately, is the sudden rise of a new city in England. A city we are accustomed to consider as the growth of centuries, for cities have heretofore always taken centuries to build. But now, such is the hugeness of the power created by the industry and wealth of this country, there is at least one city which will undoubtedly have risen within the brief space between the boyhood and manhood of its first inhabitants. We allude to Birkenhead on the Mersey, near Liverpool. By far the greater number of our readers will have never heard of this place even by name; yet it is one of the greatest wonders of the age, and indeed one of those by which the character of our age is most strongly expressed. We visited it lately, in order to ascertain how far the reports about it were true, and we now propose conveying to the public some idea of what we saw and learned on the spot.

The Mersey at Liverpool is a river or estuary, two-thirds of a mile in breadth. The ground opposite to the great emporium of commerce was, till a recent period, either altogether waste, or occupied by farms and hamlets. One of the latter, named Birkenhead, had risen in connexion with a priory of the eleventh century. Steam navigation at length facilitating the intercourse between the two sides of the river, the sloping banks opposite Liverpool had become created by a few ranges of neat mansions for the merchants of that town, and thus things went on till four or five years ago. A few enterprising persons then became aware of the suitableness of a creek in the river at Birkenhead for commercial purposes, and

proposed converting it into a set of docks supplementary to the mighty range covering six square miles in connexion with their own town. The corporation of Liverpool had bought the land surrounding Wallasey Pool, as this creek was called, for L.180,000, and now they were not unwilling to transfer their purchase. It was bought, and parliament applied to for permission to lay out L.400,000 in the formation of the proposed docks. This requisite being obtained, the Birkenhead docks were commenced last year, and are now in rapid progress. At the same time, a city capable of containing a hundred thousand inhabitants is rising close by, which our posterity will yet know as familiarly as we now do Liverpool itself, or any of the other large towns of Britain.

Our visit to Birkenhead took place on a sunny April morning of the present year. Landing from one of the steamers which cross the Mersey every half hour, we walked into this City of the Future with expectations which the reality by no means disappointed. When we had passed a mere frontier of short streets overlooking the river, we were at once launched into a mile's breadth of street-building, where unfinished houses, unmade roadways, brickfields, scaffoldings, heaps of mortar, loaded wains, and troops of busy workmen met the eye in every direction. It was like the scene which Virgil describes when he introduces Æneas and his companion into Carthage, but like nothing which had ever met our eyes in real life. Where houses were occupied, or shops opened, they had all a peculiarly fresh sparkling look, like furniture in an upholsterer's wareroom as compared with that in private dwellings. The very children playing or walking in the streets looked old beside them. In some streets, traceable as such by buildings posted here and there along a line, the substratum of the roadway was only in the course of being formed; in others, the process had advanced as far as the superficies of macadamised trap; but hardly anywhere was a beaten and smoothed road to be seen. You entered a piece of street with a particular name, and half an hour after, walking in quite a different part of the country—for country it still is in some measure—you fall into another piece of street bearing the same name. You wonder at first; but presently it appears that they are various extremities of one street; only there is a wide wilderness of brickfields between. You ask for the public buildings, and find they are all in the masons' hands, excepting a few churches. There is to be a capital town-hall—a capital market—a capital everything. We looked into the market, and found the walls and ceiling formed; a vast hall (430 by 131 feet), supported by light iron pillars, and lighted from the roof. The business going on while we were there was the laying down of the gas-pipes. Near by is the grand square of Birkenhead—a subject of pride with the in-

habitants, as it happens there is nothing approaching it in spaciousness or elegance in Liverpool. But, probably from being spoilt by the beauties of our own fair city, we thought Hamilton Square no more than passable; nor did the interior of the houses make up, in elegance or comfort, for a somewhat poor kind of architecture. It is in Edinburgh alone that the mass of the middle ranks live in palaces.

Making a detour towards the east, we found a beautiful slope rising above the nascent town, and occupied by a fine range of villas scattered throughout its space. This is Clifton Park, and it comprehends an arrangement which we have often thought might be followed with advantage in every large town in the empire. The principle is, that the place is an ornamented piece of ground, which both generally and in its parts has the usual recommendations of pleasure-ground, while houses are only scattered over it, each having the command of a certain space without interfering with general arrangements for walks, or with the general effect from a distance. Thus each family may be said to have the advantage of neighbourhood combined with the *délices* of a fine rural situation.

After a considerable walk, we reached a part of the environs which is calculated to make a greater impression than perhaps any other thing connected with the town. The misfortune of all ordinary large towns is, that they have to struggle with the difficulties imposed by former centuries—narrow streets, the nuisance of cemeteries, the want of right sewerage and of places of recreation for the inhabitants. Here Birkenhead, being a town building from the foundation in an enlightened age, has a great advantage. Its sewerage may be perfect if the managers choose; and it will be their eternal disgrace if this essential point be overlooked or inadequately attended to. They need have no lanes, no cul-de-sacs, no courts, none of the architectural curses of Liverpool. Finally, they have it in their power to reserve part of the ground at their command for recreation. We feel the greatest pleasure in stating that, following the improved sanitary views of the last few years, they have made it one of their first cares to establish a 'park'—meaning thereby an open piece of ornamented ground—for the future inhabitants of their city. We found it in the course of being formed under the direction of the well-known Mr Paxton of Chatsworth; and, to judge from what we saw of it in rather unfavourable circumstances, it promises to be a fine place. The space to be operated upon was a hundred and eighty acres. Sixty being set apart for building purposes, there remain a hundred and twenty to be laid out in shrubberies, walks, and drives, for the free enjoyment of the public for ever. Remembering what has been made of the eleven acres given by Mr Strutt to the people of Derby, we cannot doubt that a quantity eleven times greater will fulfil the objects of the managers most amply. Already the required undulations of the ground have been effected; vast quantities of trees and flowers have been planted; two sheets of water are formed; several lodges are built; and though the act for purchasing the ground dates only from September last, we may be said to have the first sketch of a park presented to our eyes. The whole is expected to be complete and at the service of the public next September. We were delighted with what we saw here; but the satisfaction of the eye is nothing in such a case; the point really to be rejoiced in is that the ideas of men are now so far advanced with respect to the essentials of public health and convenience, that, in preparing a new city, a park for the use of the inhabitants should

have been among the first things legislated for. To the same advancement is it to be attributed that the ground set apart for burying the future inhabitants of Birkenhead is at a spot called Flaybrick Hill, which also will be out of town. Here excavations are in progress for the construction of sepulchral vaults and catacombs, the removed stone being used—for the managers, like Mrs Gilpin, are of a frugal mind—in the formation of the docks. The slaughter-houses are also out of town—a suite of buildings properly enclosed, and supplied with every requisite for the preservation of cleanliness and order. Birkenhead will teach many useful lessons to older towns, and this is one of them.

We came at last to the docks, which are formed by the simple process of sluicing the water of the Wallasey Pool, and building quays along its banks. The inner dock will be of 150 acres in extent, with 19 feet depth of water; and there will be an outer or low-water harbour of 37 acres, with quay space of 300 feet in breadth (reclaimed from the sea) on each side. A range of warehouses will front the wet dock on the side towards the town. Besides these accommodations for shipping, there will be a small dock of 3 acres, and a tidal basin of 16, with beaching ground for coasting vessels. There will thus be provided, on the Cheshire side of the Mersey, a range of docks containing an area of 206 acres. Such a work, undertaken and produced at once, may safely be pronounced without parallel in this country. Around the site of the proposed docks are already various important works. There is a large establishment belonging to Mr Laird for the construction of iron vessels, and at which many have been built. There are also copper mills, a varnish manufactory, an iron foundry, gun works, a patent slip for repairing vessels, and a boiler yard.

We found three ferries between various points of Liverpool and Birkenhead, the fare twopence. It is not unworthy of notice that the receipts are higher at that small rate than when they were double the sum. It is designed ere long to have steamers plying between the two shores every five minutes, which will certainly be making a near approach to the convenience of a bridge. From one landing-place on the Birkenhead side, a railway starts for Chester, where it is continued by another line to a point on the Grand Junction, and thus brought in union with the principal ways of this kind in the kingdom. The mails from London to Dublin are conveyed by this route, and it is commonly used by parties passing between the Irish and English capitals. The steamer passes from Kingston near Dublin to Birkenhead in about ten hours, and from thence a mail-train will convey passengers to London in about the same time. It is also contemplated to have a railway to Manchester, a ship canal to connect the Mersey and the Dee, and various other great works.

It may be inquired how far Birkenhead is a built and inhabited town, and the answer is, that the actual population a few months ago was found to be about fifteen thousand. In 1833, it was a few hundreds, and probably in ten years it will be approaching a hundred thousand. Land, which a few years ago hardly possessed a value, is now selling at L.6 a square yard, and by good speculations in that line, large fortunes have been acquired. Amongst the last particulars we have heard of the place is, that houses for the working-classes are in preparation on such a scale, that the company will divide eight per cent. on their outlay, although giving a dwelling of three apartments with gas and water at L.5 of rent. We most earnestly trust they will see that these houses are

arranged outwardly and inwardly in the manner most conducive to health. We now take leave of the subject, with best wishes for the success of Birkenhead. Of the probabilities of that success we say not a word; but we feel assured that, if the contemplated works shall be duly completed, the banks of the Mersey will present the grandest monument which the nineteenth century has erected to the genius of Commerce and Peace.

THE MISHAPS OF A YOUNG GERMAN.

A TRUE STORY.

In the year 1790, Alexander Facqz, Viscount de Honig, a young and enthusiastic German, determined to see the world, and acquire in the course of a few months a quantity of knowledge sufficient to last him the rest of his life. Leaving his mother's house in Suabia, he repaired first to Paris, for the purpose of getting some insight, if possible, into the French Revolution, which was then going on; but chancing shortly after his arrival to meet with a commercial friend who was on the point of setting out for London, he resolved to accompany him to that capital. The great metropolis afforded him occupation for some time; but at length beginning to think that he had exhausted London, and having heard much about the sister island, he resolved to pay a visit to Dublin. An essential preliminary to his trip was the receipt of a remittance from his mother. This having been written for and procured, the month of March 1791 found him walking idly up and down the streets of Dublin, looking at Irish sights with German eyes, and forming from all that he saw the most German conclusions. Somehow or other, however, his money wore away much faster than he wished; and he soon found it necessary to send another letter to his mother, requesting the too-indulgent lady to forward him a second remittance.

Living in lodgings in expectation of money is at no time a very agreeable predicament, whether in Dublin or anywhere else; and in the year 1791, the transmission of letters, and especially of money letters, between this country and the continent, was attended with even greater risk than in these days of more correct management. Our young German waited and waited on, but the money never came. He told his landlord the true state of the case, and for a while his gentlemanly manners, his young honest-like face, and his interesting foreign accent, operated in his favour. The landlady would not allow the landlord to use him ill. Still, landladies are but human beings, and there are limits to the power of a lodger's face in attesting his promises of payment; and at length, after the bill had run up to a considerable amount, the landlady went over to her husband's way of thinking, and our young German was arrested for the debt, and thrown into prison.

'A situation more dreadful can scarcely be conceived,' a novelist would say; and, without going quite so far as this, we can well believe that, for a young German of birth and education, who had left his country to acquire a knowledge of men and manners, thus to find himself locked up in a Dublin prison, was somewhat unexpected, and certainly anything but pleasant.

A Dublin prison of the old school was quite a different thing from its modern representative. There was no obligation by law to support prisoners for debt; and there were cases in which such prisoners were supposed to have died of want, and many more in which deaths from want would have occurred, but for the charity of fellow-prisoners. Our hero's only hope lay in the expected arrival of his mother's long-delayed remittance. Alas! the remittance had miscarried. The viscount had made no secret of his expectation of a money letter; and when a bill drawn on a house in Dublin was addressed to him from London, some evil-disposed persons had managed to get possession of it, and feloniously converted it into cash. It was not till a month after, that the viscount received another letter, apprising him

that the money had been sent. Why he did not pursue the parties for forgery, or at least compel the payers of the bill to do so, and by that means recover the amount, is not stated. The circumstance of being a stranger, and poor, may perhaps explain what is otherwise so unaccountable. Be this as it may, this unfortunate, and, as we must pronounce him, heedless young man, would have perished for want in prison but for the compassion of his fellow-captives. His case was so peculiar, and his appearance so unusually interesting, that a prepossession was soon established in his favour, so strong, indeed, that they not only supported him by their charity in prison, but even set on foot a subscription for the purpose of discharging his small debt, and setting him at liberty. But here was another difficulty. What was he to do when he got out of prison, without any money in his pocket? Any ordinary person, with hands accustomed to work and a mind used to buffet the world, would have found no difficulty whatever; would have launched out of prison and exerted himself nobly; but to our languid and lugubrious German, with his white hands and inactive disposition, there seemed no resource whatever. He thought himself positively the most wretched man on the face of the earth; and when he looked out at the prison window, it was with the sickly feeling of a man who, never having had to rely upon himself, could not conceive how locomotion was possible in this world without money, nor how money was procurable in any other way than by asking one's mother for it. Accordingly, a letter was despatched to his mother acquainting her with his situation, and begging an immediate remittance; and in the meantime he remained in prison, and shared the bounty of Mr Fawcett and Monsieur Lafontaine, two debt prisoners who had taken a particular fancy to the unhappy foreigner.

Sunk pretty nearly to the verge of despair, in an evil hour temptation triumphed over the integrity of the weakly young man. About this time considerable sums were raised in England and Ireland by benevolent persons for the benefit of the French refugees; and it was suggested to Facqz, that, by representing himself to be a French refugee, he might obtain a sum of money sufficient to maintain him for some time, and so put an end to all his difficulties. It would be only a sort of loan; he could repay the money afterwards. So spake necessity; and our young hero had too yielding a constitution to resist the temptation. Having procured the money under the false pretence of being a French refugee, he prepared to leave prison and go in search of a lodging. It so happened that two men, who had been in the habit of visiting a friend in the Marshalsea, and who had become acquainted with Facqz, offered to accompany him, and find out a cheap and suitable lodging. Their names were James Jones and Thomas Neville. Seeking a lodging is a sore trial to anybody: greater men than our hero have sunk under it. It is an art only to be acquired by long practice; and it was with no small delight that Facqz accepted the kind offer of his two acquaintances to put him on the right track. Away went the three friends to seek lodgings. This street and that street were tried; this knocker knocked, and that bell rung; here a little slattern girl came to the door with a thin squeaking voice, there a huge dirty landlady; still the right place was not found. At last they came to a house with Mr James P—— on the door-plate. Here surely was a respectable house; quite the thing that was wanted.

Mr Jones, who seems to have been the obliging spokesman of the party, said they would be obliged to Mrs P—— for a sight of the rooms up stairs. By all means, said the lady; and so Jones and Facqz proceeded on their exploratory tour of the apartments. Neville declined to ascend. He was very much fatigued, and begged to be allowed to take a seat in the parlour till his friends came down. This arrangement being quite agreeable to all parties, Mr Neville seated himself in the room below, and before the return of

Jones and Facqz, he contrived with little difficulty to appropriate a watch which hung over the mantelpiece. Something was wrong about the lodgings, and the party left the house; but hardly had they proceeded twenty paces when an alarm was raised. They were pursued and captured, and the watch found on Neville's person. On the 5th of October 1791, they were tried before the recorder and magistrates of Dublin. Facqz, of course, protested his innocence, and no doubt he was innocent. But he had been in the company of two notorious swindlers, and to all appearance a coadjutor in the crime; and to crown his misfortune, it was now shown that he was a German, and not a Frenchman, as he had formerly declared himself to be. No man, it was argued, could be an honest man, who had committed such a deliberate falsehood. Influenced by these considerations, the jury included Facqz in the guilt of watch-stealing, and along with his two acquaintances he received sentence of transportation.

Behold our poor languid hero again in prison, and this time not for debt, but for felony, and waiting transportation. The mere imprisonment in such a place would have been punishment enough for the greatest crimes. There was then no established system of prison discipline; the prisoners were left to the tender mercies of the turnkeys; and those who could not bribe them, suffered the harshest treatment. Facqz had no money, and he became one of the victims.

In these dark days Mr Samuel Rosborough was the Howard of Ireland. The poor forgotten prisoners were his peculiar charge. For twenty years he had been accustomed to visit the prisons, rendering assistance to those who had no other friend. Facqz had heard of his name and character; and in the depths of his despair sent him the following letter:—

'SIR—From the many acts of generous kindness done by you to the unfortunate in this prison, I am induced to hope you will suffer my present melancholy tale to be heard by you, and interfere in my behalf.

'I am under the dreadful sentence of transportation, charged with committing a crime at which my nature revolts. To enter, however, upon any justification of myself at this time is not my object. From the 7th of this month, I have been lying in a cell, loaded with irons, which have been put on by Mr Walsh the turnkey, when he knew I had no money to give him. Well knowing you will not suffer me to remain any longer in this loathsome place without your merciful interference, I shall look with anxious expectation for you.

'During these five last days, my mind has enjoyed a calm by attentively listening to the prayers of an unfortunate man in the next cell, who, I hear, is shortly to suffer death. Oh that I were so near that period, for then I would be released from my sufferings!

'Excuse this freedom, and permit me, in addition to my fervent prayers for your welfare, to subscribe myself—Your most obedient and devoted servant,

October 26, 1791.

ALEXR. FACQZ.'

Mr Rosborough immediately visited him; and his interference had the effect of procuring him better treatment. The poor prisoner began to hope that the same benevolence might be of use in procuring his release; and accordingly he sent many letters to Mr Rosborough, giving an account of himself, his previous mishaps in Dublin, and the manner in which he had been brought into his present situation. A person possessed of more sense would have told his story in a plain, straightforward, matter-of-fact way; but our young German's letters to Mr Rosborough were so fanciful, so sentimental, and so full of ohs, and ahs, and adjectives, that the good philanthropist read them with considerable distrust. At length, however, owing to the considerate interposition of Mr Lafontaine, who had now left prison, and who had procured some knowledge of the viscount's family, Mr Rosborough was induced to listen to what Facqz told him, and to attribute the sentimentalism of his letters to their right cause—namely,

to his being a German, and one of weak character. 'From me,' wrote Facqz to him, 'you dissipate every gloom, and cheer and vivify my whole soul. May you long live to enjoy that ennobling virtue which alone gives dignity. May every instance of benevolence and humanity shown by you in this and every other place, be blessed with success; and when the hoar-frost of winter's age shall besprinkle your head, and the divine lamp of life yield its last gleam, may you enjoy that felicity which is the portion allotted by him who said "I was in prison and ye visited me." I have requested Mr Lafontaine to call on you. He will tell you who I am. If not redeemed from this horrible place, I shall perish. Mine eyes can scarce see what I have written; they are sore with weeping; my head aches for want of rest, and mine ears are tormented with hearing blasphemies. Oh that I had never been born, then should I be a stranger to such a place as this!'

Moved by these wallings, and by his own innate benevolence, Mr Rosborough did make some interest with the recorder in the young man's behalf. But the sad fact of his having passed himself off as a French refugee, and obtained money on false pretences, again rose up against him; for the recorder himself had been connected with the management of the refugee fund. Nothing could be done for such a person, and again Mr Rosborough gave him up. Oh that terrible falsehood!

Meanwhile, poor Facqz had been thinking of another way of effecting his escape. He had heard that money could do it, and he had written pressingly to Germany for money. Many wonderful escapes had been effected from the prison about this time, the mode of which was not discovered till afterwards. The principal agent in these escapes was the head-turnkey's wife. She had offered to give Facqz his liberty for forty pounds, and the following was to be the plan adopted. She was to administer to him draughts of tobacco water, and other narcotics, report him ill, and have him transferred to the hospital, where he was to grow gradually worse and die. When he was fairly dead, he was to be let out of prison; a corpse having been procured to be laid in his bed, for the satisfaction of the doctor. The plan may appear doubtful to our readers; but it had succeeded before, and Facqz hoped it might succeed in his case. But the forty pounds were still wanting; and the beginning of the year 1792 found him still languishing in jail.

Letter after letter he sent to Mr Rosborough, beseeching him to reconsider his case; and at length the good gentleman began to get a notion of the real simplicity of our hero's character. He interested himself again in his behalf, and represented the affair as well as he could to the recorder. Here was a young German, he said, of good family, who had got into a scrape, whether owing to folly or criminality, he would not say; but would it not serve all the purposes of banishment to send him home to his friends in Germany, instead of incurring the expense of sending him to Botany Bay? The recorder was induced to use his influence with the lord-lieutenant, and the consequence was, that Facqz received a free pardon. The rapture of Facqz on this announcement being made to him, threw him into a fever, from which he did not recover without difficulty. On his recovery, he pled his majesty's pardon in court, and was set at liberty, as will be seen from the following copy of a certificate, the original of which may be inspected by any one who chooses to consult the records of the clerk of the crown's office in Dublin:—*'Certificate'*—'At an adjournment of sessions on the 31st of May 1792, Alexander Facqz de Honig pleaded his majesty's free pardon, which was allowed by the court, and he was thereupon discharged.'—Extracted from the crown books.—ALLEN and GREENE, Clerks of the Peace.'

Our hero's mishaps were not yet over. Taking leave of his kind friends, Mr Rosborough and Mr Lafontaine, he proceeded to Liverpool with a little money in his pocket, supplied by them. 'I had scarcely landed in Liverpool,' he says in the account which he afterwards

wrote to Mr Rosborough of his adventures, 'when I narrowly escaped breaking my leg in consequence of the absence of enclosures for the cellars in that filthy town. Into one of these holes I fell, and stripped thereby the bone of my leg completely of the flesh from the ankle to the knee.' Detained in Liverpool for a long time by this injury, his money was again all expended; and we hardly know by what means he arrived at York, whither it appears he had gone, with a view of proceeding thence to Hull, where he hoped to procure a passage to Hamburg. 'I arrived at York,' he says, 'about five o'clock in the evening, with fourpence in my pocket, my shoes worn to pieces, the big toe of my right foot projecting out.' Strolling into York minster, he attracted the notice of a benevolent and venerable clergyman, who entered into conversation with him, and after hearing his story, and putting its truth to the test by asking him questions which none but an educated man could answer, showed him much kindness, and not only paid his coach fare to Hull, but gave him a letter of introduction, which secured his passage to Hamburg. At length, after several ups and downs more, he reached his home in Snabia, and was clasped in the arms of his own dear remittance-sending mother. One of his first cares, after reaching home, was to write to his friends, enclosing the amount of money he had borrowed from them.

Our hero had probably obtained more wisdom and business talent in the course of his Irish misfortunes, than he would have obtained by any other mode of training; for the remainder of his life exhibits more sense and sedateness than might have been expected. Having procured a commission in the Russian army, he proceeded to St Petersburg, where the only drawback to the pleasure he took in his military duties was, that it was very cold. His abilities and accomplishments appear, however, to have succeeded in gaining him good friends; for, after serving in some inferior diplomatic situations, he was sent by the Empress Catherine on a mission to the English cabinet in the year 1796. He embraced the opportunity of doing two things, both of which were characteristic; in the first place, he bought a splendid carriage in London, with which he said he meant 'to cut a dash in St Petersburg;' and in the second place, he revisited his friends in Ireland. 'One morning,' says Mr Rosborough in narrating the story, 'I received a message from the Kildare Street hotel, informing me that a gentleman just arrived there wished to see me immediately. On repairing thither, I was received by a servant in gorgeous livery, who spoke with a foreign accent, and introduced me into a room, in which, to my unspeakable astonishment, I saw Viscount Facqz and Mr Lafontaine seated at breakfast.'

The three friends spent several happy days together. Unluckily, however, during our hero's visit, Mr Lafontaine, whose circumstances were still embarrassed, was again arrested for debt; and it speaks the true character of our hero, that, though he had bought a splendid carriage, and was living in a princely style, he yet had no other means of extricating his friend out of his difficulty than by pledging his watch. After staying a week in Dublin, during which he visited his old prison, he returned to London, and thence to St Petersburg, from which he kept up a constant correspondence with his two friends. In one of his letters, he tells them that he had recovered his estate of Honig, which had been taken possession of by the Carmagnoles; and he expresses his anxious wish that they were all three together living upon it, where he says 'he would nurse and cherish them, and make them so happy, that they should be like *diamonds in cotton*.' It was not till 1803, however, that, after having seen some hard service, and been completely shattered in health, he was able to retire to the Chateau de Honig. His last letter to his Irish friends is dated February 1803, and in it he is as sentimental as ever. He appears to have died in the same year.

And now, what was this Alexander Facqz, Viscount de Honig? He was a specimen of what we often see in

the world—an accomplished, amiable, interesting young man, with a tolerably good head, a very affectionate heart, and a weak, languid, unmuscular character, that always began crying when a difficulty came in the way.

Like *Æsop* of old, we may conclude our tale with a moral, which it may be well for all young persons, including gentlemen under the age of twenty-five, to bear in mind. Let nothing tempt you to tell a falsehood; take care of the company you keep; labour honourably for your bread; and try to depend as little as possible on remittances from your mother.

THE SERVIAN AND THEIR SONGS.

THE just and natural curiosity respecting Russia and its inhabitants, which during the last few years has been aroused in the English mind, will in all probability be increased rather than diminished in the course of this and the immediately succeeding generations. Nor will it ever, we are inclined to think, be finally satisfied with anything less than a thorough comprehension, not of the Russians only, but of the other interesting nations and tribes who, along with them, compose the great Slavonian family. Their growing political and commercial importance can escape the glance of no one; but, apart from such considerations, these fifty-five millions of Slavonians deserve attention on purely intellectual grounds; and even we, the countrymen of Shakspeare, of Milton, and of Burns, may find our account in the study of their literature and their languages. It was but the other day we heard a friend predict, that in thirty years a knowledge of Russian would be as common an accomplishment among us as a knowledge of German is at present. And strange as it may appear to many of our readers, we believe the prediction to be a correct one. From what we can learn respecting the contemporary literature of the Slavonians, it would seem that while in the west, as on all hands is admitted, the genius of poetry pauses in her career, in the east she is quickening her step, and perhaps about to pass us in the race. But however this may be, in one important department, the poetry of the people, the Slavonians have already immeasurably outstripped us; and by competent judges it is decided that the collective minstrelsy of all other countries must yield, both in wealth and in beauty, to that of the nations of Slavonian origin. There is, further, in this respect, a curious and interesting distinction between western and eastern Europe. Our accumulated stores of popular poetry seem closed to all accessions save from a somewhat distant past; but with the Slavonians, this very present, as it flies, its joys, its sorrows, all its varied emotions, are being changed into melody and song: here the stream has formed itself into a lake; yonder, receiving new tributaries, it still flows onward, widening and gathering strength as it proceeds.

Russian, Servian, Bohemian, Polish, at once the most cultivated and extensively-diffused of Slavonian dialects, while a strong family-likeness pervades the four, fall naturally into two divisions, one of which comprises Russian and Servian, the other Bohemian and Polish. Among these the language of the Servians stands pre-eminent for power, flexibility, and music; nay, we have even seen somewhere quoted an opinion of the historian Niebuhr, to the effect that theirs is altogether the noblest of European languages. The superiority of their popular poetry we cannot so confidently affirm, though we believe it to be on the whole pretty generally admitted. It was by a lady that the wonderful excellence of the Servian minstrelsy was first made known at all extensively in the west. Theresa von Iakol, the daughter of a German professor in one of the Russian universities, on her return to her fatherland, published

in 1825 a translation of many of the Servian songs, and to the beauty of these, even in their foreign garb, the attention of Germany was decisively called by the greatest of recent poets and judges of poetry, Goethe. From the few English translations executed by this lady (since her marriage with Professor Robinson, the well-known author of 'Biblical Researches in Palestine'), and from Dr Bowring's 'Specimens of Servian Poetry,' we propose to present some selections to the reader, with a slight preliminary sketch of the singular nation and country among and in which the songs themselves have arisen.*

Servia proper lies to the south of the Save and of the Danube, on either side of the river Morava, separated on the west from Bosnia by the Drina, on the east by the Timok from Bulgaria; and on the south from Macedonia and Albania by the heights that form a westward continuation of the great Balkan chain. It is a country with about a million of inhabitants, and of some four hundred square miles in extent; traversed and intersected by innumerable streams and mountains. Its mountains, as well as the large plains that stretch along the banks of the Danube and of the Morava, are covered with forests of oak on all sides towards the interior, of almost impenetrable thickness; and among these, here and there in the many valleys which the hill ranges compose, the brawling torrents collect themselves into peaceful lakes. South-eastwards, a road has been cut through the forests, which extends almost from the capital, Belgrade, to the border-fortress of Nyssa; and as it forms an important section of the route from Vienna to Constantinople, it is often traversed by lovers of the picturesque.

Compared, however, with the tracts once occupied by Servian tribes, Servia proper appears an inconsiderable speck, and its extent gives no idea of the territory even at this day inhabited by Servians in everything but name. Tributary to Austria or Turkey, some Christians, and others Mohammedans, they form a varied race, but still possess a strong national resemblance. Since the Servian revolution of 1817, the inhabitants of Servia proper, although paying a small tribute to the sultan, and having a pacha with 500 Turks to garrison Belgrade, have formed a kind of independent people. They have even, it would seem, a constitutional government, with the usual apparatus of a hereditary prince and a representative assembly; the latter, to the great joy of Lamartine, holding its meetings as in the patriarchal times, in the open air, beneath the shade of lofty trees!

The Servian houses are so constructed, and lie so far apart from each other, that a village of forty or fifty dwellings often occupies as much ground as a city like Vienna. In its first stage, the Servian house consists of a large square mud-built apartment, strewn with hay or dried moss and the bark of the lime tree, and in its centre the one fireplace of the family, from which the smoke ascends to escape through an opening in the roof. Here the father and mother sleep: round this, as a nucleus, stretch far and wide the sleeping-chambers of the other inmates, married and single; for in Servia the son, when he weds, remains with his bride under his parents' roof; nor even on the father's death is the family broken up, but the brothers select the strongest and skilfullest among themselves to rule in his stead. All the many inmates compose a single household; all labour and take their meals together; and in the winter evenings assemble round the common hearth. Living in this secluded fashion, the Servians have retained the simple and kindly manners of primitive times. As soon as a stranger approaches one of their dwellings, the master hastens to the door to greet him, and tell him he is welcome. As he crosses the

threshold, the women and children kiss his hand. The largest table is straightway covered with the best the house affords; the men sit down to feast with the stranger, while the females stand round to wait upon his call. When the hour of rest approaches, a servant enters with a basin of water, and the hostess kneels to wash the feet of her wearied guest. In the morning again, he must not depart until he has partaken of a hearty repast, nor then without a cordial and respectful blessing.

Over communities such as we have described, the influence of the clergy might well be expected to be supreme. But in Servia, the bishops, all foreigners, and chosen by the patriarch of Constantinople, reside in the towns, and have no intercourse with their flocks. The papas, or priests, on the other hand, can scarcely be called a separate class; they are obliged to labour with their hands for their support, and their functions seem confined to reading from the liturgy at baptisms, marriages, and deaths. Thus the Servians have been allowed to retain, from the most remote ages of paganism, a number of usages, which, stripped perhaps of all that may have stood in direct hostility to the Christian faith, and sometimes indeed wonderfully blended with its results, seem to indicate, according to Professor Ranke, the mysterious connexion which the simple husbandman believes to exist between himself and nature. On these singular rites, adapted to the changeful phenomena of the natural year, an essay might be written. It need here only be observed, that song enters into all the strange half-symbolical ceremonies of the Servians. But with them it is not merely the solemn accompaniment of festivals, or an occasional holiday amusement. They do not love to listen to their inexhaustible lays only when chanted by a single performer; to the monotonous music of their simple one-stringed harp, the *Gusle*, at merry-makings, or by the fireside in the long winter evenings. A nation of singers, poetry is the natural organ of their spiritual life, prose but the medium of business-communications. Song enhances and reflects all their occupations and enjoyments; its choral melody rises not less frequent and loud from the herdsmen on the mountains, the plains where the reapers ply the sickle, than in the hall where the women sit spinning round the hearth, or from the square where the village youths and maidens assemble to dance the *Kolo*. We find in Servia no separate class of minstrels, whether composers or singers. By name the Servians know not, and do not care to know, the authors of their beautiful lays, which an unnoticeable bounty, like that of nature in her gifts, appears to have been for ever evolving from the dance of the Hours. In quick and striking alternation you hear them sing the ballad that narrates some heroic passage of their recent revolution, and that in which an ancient worthy has commemorated the mournful defeat of Kossova. The songs of yesterday are simple, touching, and peculiar as those of centuries ago—all appear fragments of one great work. It seems as if a national mind had been expressing, through varying generations, its unchanging thought and emotion, as if there had only been wanted some man of more than common susceptibility and skill to weave these unconnected utterances into a series of harmonious epics, that might rival—with reverence be it spoken—the unapproachable Homeric poems themselves.

Goethe has well remarked, that the compositions of which we speak can be rightly enjoyed only in a collected form; yet, though our few specimens can give the reader but an imperfect notion of this collection, he will be enabled to form from them a clearer judgment of the spirit of the whole, than from many pages of disquisition. In conclusion, we may say that cheerfulness—a serene and cheerful transparency—is the principal characteristic of the Servian poetry. The pathetic incident is presented to the hearer or reader with a simple truthfulness beyond the reach of the most consummate art; but no complaint is heard from the singer; he stands altogether above his subject. And as the Servian

* Mr Lockhart also has printed for private circulation 'Translations from the Servian Minstrelsy,' but these are not 'in the metre of the original,' of which (in this case, we may say), consequently, they give no idea.

ballads want the deep melancholy, so also they want both the frequent obscurity, and, as has been justly observed, the dramatic vivacity of the Scottish and other northern lays. In the former, from the longest narrative to the tiniest love-song, everything is, in epic fashion, told, described, made distinctly visible. Nor are the actors to whom these songs introduce us invested with anything of an ideal greatness; their heroism and love are such as belong to the uncultivated, sometimes half-savage, children of nature. We are not raised into a purer and loftier region; yet, it must be added, on the reality in which we find ourselves the sun of true poetry shines, and in its ethereal light the trivial and repulsive disappear. Again, in these songs we are but sparingly introduced to the supernatural beings with whom the western and northern imagination has peopled in such profusion the waste and solitary places; almost the only personages of this kind in whom the Servians put faith being the female appearances, named *Vilas*—a fine creation of the fancy.

Our first specimen shall be the poem which narrates the death of the hero Marko, one belonging to the second earliest cycle of the Servian songs. Through 160 years the invulnerable Marko has survived, along with his horse *Sharaz*, the strangest vicissitudes and adventures, and now, wildly mysterious as his life has been, so also is his death. Surely something of the matchless simplicity and pathos for which the original is famed is discernible in the translation.

DEATH OF KRALEVICH MARKO—(*Dr Bowring*).^{*}

At the dawn of day, the noble Marko
Rode in sunlight on the Sabbath morning,
By the sea, along the Urvina mountain,
Towards the mountain top as he ascended,
Suddenly his trusty Sharaz stumbled;
Sharaz stumbled, and began to weep there.
Sad it fell upon the heart of Marko,
And he thus addressed his favourite Sharaz:—
'Ah! my faithful friend, my trusty Sharaz,
We have dwelt a hundred years and sixty,
Dwelt together as beloved companions,
And till now have never never stumbled:
Thou hast stumbled now, my trusty Sharaz;
Thou hast stumbled, and thine eyes are weeping.
God alone can tell what fate awaits me;
One of us is surely doomed to perish,
And my life or thine is now in peril.'

[While Marko apostrophises his trusty horse, the 'white Vila' announces to him that he is doomed to die, which enrages the hero, but the phantom continues:—]

—'If thou wouldst doubt the mountain Vila,
Hasten to the summit of the mountain;
Look to right and look to left around thee.
Thou wilt see two tall and slender fir trees,
Fir trees towering o'er the mountain forests;
They with verdant leaves are covered over;
And between the fir trees is a fountain;
Look, and afterwards rein back thy Sharaz;
Then alight, and bind him to the fir tree:
Rein thee down, and look into the fountain;
Look—as if the fountain were a mirror—
Look, and thou shalt see when death awaits thee.'

Marko did as counselled by the Vila.
When he came upon the mountain summit,
To the right and left he looked around him;
Then he saw two tall and slender fir trees,
Fir trees towering high above the forest,
Covered all with verdant leaves and branches.
Then he reined his faithful Sharaz backward,
Then dismounted, tied him to the fir tree,
Rein him down, and looked into the fountain;
Saw his face upon the water mirrored,
Saw his death-day written on the water.

Tears rushed down the visage of the hero;
'O, thou faithless world! thou lovely flow'ret!
Thou wert lovely—a short pilgrim's journey—

[And so, for a considerable number of lines, Marko laments his fate; after which he breaks his sabre and lance, and flings away his weapons. He now drew]

From his breast a golden tablet;
From his pocket drew unwritten paper,
And the princely Marko thus inscribed it:—
'He who visits the Urvina mountain,

He who seeks the fountain 'neath the fir trees,
And there finds the hero Marko's body,
Let him know that Marko is departed.
When he died, he had three well-filled purses:
How well filled? well filled with golden ducats.
One shall be his portion, and my blessing,
Who shall dig a grave for Marko's body:
Let the second be the church's portion;
Let the third be given to blind and maimed ones,
That the blind through earth in peace may wander,
And with hymns laud Marko's deeds of glory.'

And when Marko had inscribed the letter,
Lo! he stuck it on the fir tree's branches,
That it might be seen by passing travellers.
In the fount he threw his golden tablets,
Doffed his vest of green, and spread it calmly
On the grass, beneath a sheltering fir tree;
O'er his eyes he drew his Samar-khispak,^{*}
Laid him down—yes! laid him down for ever.

By the fountain lay the clay-cold Marko
Day and night; a long long week he lay there.
Many travellers passed, and saw the hero,
Saw him lying by the public pathway;
And while passing, said, 'The hero slumbers!'
Then they kept a more than common database,
Fearing that they might disturb the hero.

[At length Vaso, a pious churchman from Vihindari, passes with his young attendant Iajla; attracted by what he considered the sleeping hero, and looking in anxious terror round him, he]

Saw the letter on the fir tree branches;
Read it from a distance; as he trembled,
Read that Marko had in death departed.
From his horse the astonished monk alighted,
Seized the hand of Marko; Marko moved not!
Long he had been dead—long since departed!

Tears rushed swiftly from the eye of Vaso,
Marko's fate filled all his thoughts with sorrow.
From the girdle, then, he took the purse,
Which he hid beneath his own white girdle:
Round and round inquired Iugman Vaso,
Where he should entomb the hero Marko;
Round and round he looked in fond inquiry.
On his horse he flung the hero's body,
Brought it safely to the ocean's borders,
Thence he shipped it for the Holy Mountain,
Near the white church, Vihindari, landed;
To that white church he conveyed the body;
And, as wont, upon the hero's body
Funeral hymns were sung; and he was buried
In the white church aisle—the very centre;
There the old man placed the hero's body.
But no monument he raised above him,
Lest when foes should mark the hero's grave-stone,
Theirs should be the joy, and theirs the triumph.

None of the Servian poems are more attractive than those which relate to love. But, alas! in Servia marriages are settled entirely by the parents, so that the forced termination of a long-cherished mutual affection forms there, as here, the theme of many a mournful ditty. Take, however, the following beautiful picture of two betrothed and happy lovers, which has an almost Chinese purity and clearness, along with an impassioned tenderness, to which the Chinese are strangers:—

MAY IT LAST.—(*Mrs Robinson*.)

Cross the field a breeze it bore the roses,
Bore them far into the tent of Jovo;
In the tent were Jovo and Maria—
Jovo writing, and Maria 'broidering.'
Used her Jovo all his ink and paper,
Used Maria all her burnished gold thread.

Thus accosted Jovo then Maria:
'O sweet love, my dearest soul, Maria,
Tell me, is my soul, then, dear unto thee;
Or my hand, findest thou it hard to rest on?'

Then with gentle voice replied Maria:
'O, in faith, my heart and soul, my Jovo!
Dearer is to me thy soul, O dearest,
Than my brothers, all the four together.
Suffer is thy hand to me to rest on,
Than four cushions, softest of the soft ones.'

Here, as we have seen, the gentleman is assured that his beloved prefers him even to her 'brothers, all the four together,' a compliment which a British wooer would not very highly prize.

The reader will be struck with the likeness between

* All the versions given in this article are in the rhymeless, unrhymed, trochaic metre of the original.

* 'Sable-cap.'

our next extract and Sir Walter's 'Young Lochinvar.' He may compare the description, in the opening lines, of a high-born Serbian lady with that of a Scottish maiden in Burns's song, 'On Cessnock banks there lives a lass.'

AJKUNA'S MARRIAGE.—(Dr Bowring.)

Never, since the world had its beginning,
Never did a lovelier flow'ret blossom
Than the flow'ret we ourselves saw blooming
In the white court of the Bey Liubovich.
High above the level Nevosina
Towered the fascinating maid Ajkuna;
She, the Bey Liubovich's lovely sister.

She was lovely, nothing e'er was lovelier;
She was tall and slender as the pine tree;
White her cheeks, but tinged with rosy blushes,
As if morning's beam had shone upon them,
Till that beam had reached its high meridian;
And her eyes, they were two precious jewels;
And her eyebrows, leeches from the ocean;
And her eyelids, they were wings of swallows;
Silken tufts the maiden's flaxen ringlets;
And her sweet mouth was a sugar-cake;
And her teeth were pearls arrayed in order;
White her bosom, like two snowy doves;
And her voice was like the dovelet's cooing;
And her smiles were like the glowing sunshine;
And the fame, the story of her beauty,
Spread through Bosnia and through Herzegovina.

Such a peerless maiden has, as may be supposed, no lack of suitors. To only two of these we are introduced; one is 'the gray-headed Mustaph Aga'—gray-headed indeed; but then he 'proffers a thousand golden coins' in hard cash, not to mention a 'golden drinking vessel' of unspeakable magnificence and value: the other, Suko, may be young, and dwell 'upon the country's border, as a falcon dwells among the breezes;' but, alas! if we except his 'sabre and his steed so trusty,' all his wealth is ten ducats—surely a very inadequate sum! In spite of this, however, the candid 'Bey Liubovich' makes the fascinating maid, 'Ajkuna,' acquainted with both offers, and thus far merits our praise: like a confiding and dutiful sister, she bids him decide for her. The prudent nobleman, when the bridal party is met, of course points to the wealthy old man in the distance, which discomposing the lady, she asks who is that young man 'on the white horse seated?'

'It is the hero, Suko of Urbina,
He who for thee with thy brother struggled,
Struggled well indeed, but could not win thee.'
When the lovely maiden heard the leader,
On the black, black earth, anon she fainted.
All to raise her, hastening, gather round her,
And the last of all came Mustaph Aga:
None could lift her from the ground, till Suko
Sticks into the earth his waving banner,
Stretches out his right hand to the maiden.
See her! see her! from the ground upspringing,
Swift she vaults upon his steed behind him;
Rapidly he guides the courser onwards,
Swift they speed across the open desert,
Swift as ever star across the heaven.

When the old man saw it, Mustaph Aga,
Loud he screamed with voice of troubled anger—
'Look to this, ye bidden to the wedding!
He, the robber! bears away my maiden:
See her, see her borne away for ever!'

But one answer met the old man's wallings:
'Let the hawk bear off the quail in safety.
Bear in safety—she was born to wed him;
Thou, retire thee to thy own white dwelling
Blossoms not for thee so fair a maiden.'

And so the curtain drops. We hope that in the long-run all parties, even the ill-used Mustaph Aga, were pleased.

We close our quotations with the following sweet and simple lines, entitled

THOUGHTS OF A MOTHER.—(Dr Bowring.)

Lo! a fir tree towers o'er Sarajevo,
Spreads o'er half the face of Sarajevo,
Rises up to heaven from Sarajevo;
Brothers and half-sisters there were seated;

And the brother cuts a silken garment,
Which he holds, and questions thus his sister:
'Brother's wife! thou sweet and lovely dovelet!
Wherefore art thou looking at the fir tree?
Art thou rather dreaming of the poplar;
Or art thinking of my absent brother?'

To her brother thus the lady answered:
'Golden ring of mine! my husband's brother!
Not about the fir tree was I dreaming,
Nor the noble stem of lofty poplar;
Neither was I dreaming of thy brother;
I was thinking of my only mother.

She with sugar and with honey reared me;
She for me the red wine poured at even,
And at midnight gave the sweet metheglin;
In the morning milk, with spirit chastened,
So to give me cheeks of rose and lily;
And with gentle messages she waked me,
That her child might grow both tall and slender.'

A SOCIETY OF LAND IMPROVERS.

THE subject of the allotment and improvement of waste lands is one which has at various times deservedly claimed a share of public attention. Numerous reports have been published descriptive of the beneficial results which have followed the application of the system in different localities: in some, the success has been complete; in others, the experiment has partially failed, owing to the incompetence of the parties on whom the management devolved, or to the unwillingness of the labourers to undergo the requisite exertion. Ireland is a country possessing, as is generally allowed, peculiar claims upon active philanthropy; and among the schemes suggested or undertaken for her improvement, none have met with so favourable a reception as that for the reclamation of the neglected and uncultivated portions of her soil, conducted by an institution called the Irish Waste Land Improvement Society.

This society, it appears, with the Earl of Devon at its head, was formed in 1838, and being incorporated by act of parliament, it obtained the possession of many thousands of acres of waste land—mountain, and peat moss or bog—on leases of 99 years at a very low rent, averaging about 1s. 10d. per statute acre. The plan of the company was not to speculate in farming themselves, but to re-let the whole in small farms of 15 to 25 acres, on leases of 31 years, at a rent varying from 4s. to 10s. per acre, undertaking at the same time to make all the roads, main drains, and fences, at their own cost. In the present day, when almost every town has its improvement society, which does little else than talk, it is cheering to find that there is at least one institution, which actually works—really tries to accomplish what others only are contented with projecting.

Nor has this improvement society acted rashly in its operations; great caution has been employed in every step of its progress. The first purchase was a small mountain tract in Galway; the second, in the county of Limerick; the third, in Sligo; and lastly, a wild district in Connemara, comprising more than 7000 acres, was taken about three years since. It is a favourable feature of the proceedings, that the calls upon the shareholders have been made at long intervals: no more than L.8 per share has been paid up to the present time. The aggregate amount received, about L.25,000, has enabled the society to place the four estates, comprehending 10,000 acres, in a forward state of cultivation. The estate of Gleneask, in the county of Sligo, consists of 5699 statute acres, and is beautifully situated on the south-eastern slope of the Slieve Gauff mountains, commonly known as the Lurgan hills. Their height is about 1000 feet above the level of the sea, and they overlook a valley nearly seven miles in length, watered by nume-

rous mountain streams. The soil is described as 'pure unmitigated peat bog, from two to eight feet in depth, with a substratum of clay or gravel.' A portion of the upper slopes is laid out in pasture, well adapted for rearing the Highland breed of cattle, of which the society possesses a thriving herd. The steward of the estate, Mr Lermont, is an industrious North Briton. With his wife and two daughters, he occupies the house adjoining the model farm, where, upon a piece of bog reclaimed within two years, were growing as fine Swedish turnips as could be found in the fertile barony of Cork. Near the entrance gate, standing on the society's land, are several whitewashed buildings; these are, a police station-house, porter's lodge, chapel, and national school. Proceeding onwards along a fine wide gravelled road, the plan of the allotments becomes visible, marked out by open drains, and green banks of sod, crowned by clipped hedges of furze. The dwellings of the servants are built facing the road, with which they communicate by narrow walks, bordered with the alder and Lombardy poplar. The houses of the tenants are 30 feet long, 13 feet wide, and 8 feet high; they are built of stone, and divided into two rooms, thatched and glazed; the cost of each to the society being L.16, 5s. This expense is greater than it otherwise would be, owing to the great depth to which it is necessary to dig for the foundation, which must be carried through the bog. The company do not, however, build for every tenant; they prefer to induce the settler to build for himself, giving him assistance from their supply of timber. This plan has been found to attach the occupant to the soil more securely than if he had been provided with a dwelling, while at the same time it serves to quicken and stimulate his exertions for the improvement of the property. The society offers powerful inducements in furtherance of this object: it gives a prize of L.2 for every acre of reclaimed land, which is equal to four years' rent at the higher rate. This plan is found to succeed, as, by the improved system of drainage, the unproductive bog soon becomes a flourishing field.

On every farm held by the smaller occupiers, turnips and clover were growing, and in many instances rape and vetches. The potatoes—lumpers, Peelers, and Americans—were everywhere excellent, and the presence of two or three head of cattle on each holding showed that the accumulation of manure was certain. The main drains are made from 4 to 6 feet wide at top, $2\frac{1}{2}$ to $3\frac{1}{2}$ at bottom, and from 3 to 5 feet in depth; the thorough drains are 2 feet wide at top and bottom, with a small channel in the centre from 6 to 8 inches in width, covered closely by a sod turned the green side downwards. The firmness of the soil is such, that the drains require no lining except in the clayey ground, where they are filled with stones. After draining, the surface is burned and limed, when two successive crops of potatoes are taken, then a crop of Aberdeen turnips, followed by oats laid down in clover. Recent analysis by Professor Kane has shown a rich bed of marl in the neighbourhood to contain some of the most important elements which can be applied to the fertilisation of peat. In some cases turnips have been raised as a *first* crop, thus proving the productive nature of the land. It is, however, recommended, in preference to this method, to follow the plan of culture above described. Much difficulty was experienced in persuading the ignorant Irish cottier to take the necessary steps to insure a good crop of turnips. Mr Lermont says, 'When I insisted on the plants being thinned out to nine inches' distance, and showed them the distance by pulling up a few myself, it was like pulling the hair out of their heads: some actually cried!'

The indispensable necessity of cleanliness, and the absence of all extraneous lumber in the dairy, to say nothing of the filthiness of keeping animals in the dwelling-house, are points strongly impressed upon the minds of the tenants by the managing director and the ever-watchful steward. Those who prove refractory are debarred from participating in the prizes

which 'are given annually for draining, green crops, cattle, cleanliness, &c. Great emulation is excited among the tenantry by these premiums, of which the agricultural are paid in money, the household in kind; and a gown or shawl to the "good-wife" is found more effective than the purchase-money, where shops are so distant. The personal appearance and costume of the female peasantry in this mountain district contrast strikingly with those of Munster: small regular features are much more frequent; and the slovenly flounced cap is never seen but on married women and the aged: spinsters wear their hair exposed, and in neat order. The Sunday appearance of both males and females is not only respectable, but picturesque, reminding one of the Alpine Sabbath in more favoured lands. Scarlet and bright blue are the favourite colours of the females.

Father Mathew has not overlooked Gleneask: nearly all the tenants are "teetotallers;" and illicit distillation, once so prevalent in the district, is now of rare occurrence.

The unavoidable difficulties of a new settler during the first year are most considerably met by the admirable system of Colonel Robinson, the director, which provides him with the means of subsistence by employment in making the main drains and fences of his own allotment, thus rendering him independent of the land, until it is made, by his own labour, to produce a crop. The rate of wages is 8d. per day: 10d. per perch is paid for the fences; 4d. per perch for the larger main drains, and 2d. for the smaller. Some good attempts at a dairy have been made by several of the small holders, and Miss Lermont is indefatigable in her efforts to instruct them in the making of cheese, storage for which is provided at the farmery.

The want of capital is often talked of as the cause of defective farming among the occupying tenants in Ireland; but what would capital avail them without the knowledge of its application? whereas personal instruction and encouragement would make their present capital—their labour—produce fourfold. Agricultural societies may do much for those who are able to read, and are otherwise more enlightened than their neighbours: but what have they effected, comparatively, for the cottier tenant, unable to read—perhaps, like some of the Gleneask tenants, unable to understand English? He may doubtless see the results of good farming at the annual shows, and, if he can afford it, hear the speeches and dissertations at the agricultural dinners; but will this induce him to thorough drain, subsoil plough, or sow turnips? or, if he were willing to learn, instruct him how the work should be done? Practical, sound instruction, is the only mode suited to the small farmer. It is not only necessary to tell him, but to show him how the work is to be done: the stimulants of precept and reward are insufficient—personal instruction, encouragement, and superintendence, are wanting. To supply those wants is one of the main objects of the Irish Waste Land Improvement Society. Colonel Robinson is not satisfied with the ordinary statement of rent and arrears, but examines personally every cottage, goes over every acre of reclaimed land, directs, corrects, and encourages. A cheerful recognition, a good-humoured reproof, a friendly jest or encouraging remark, play upon the surface of a well-considered system of moral and physical improvement. Human nature, in whatever grade, requires some stimulant for the development of her faculties; and whether it be wealth or power, praise or honour, or even the lowly stimulant of the poor Irish cottier—mere subsistence—where the pressure is not felt, the machinery becomes inert, and the 'time enough' and 'well enough' assume the places of labour and activity.

This no doubt involves labour and agricultural knowledge on the part of those intrusted with the management of estates; but men qualified to undertake such duties are not wanting; and how gratifying must be the sensations of that landlord who can point to a large

tract of reclaimed mountain or a recent moor teeming with profitable vegetation, and say—'These once sterile acres afford now food and shelter to a thriving peasantry, blessing, like the quality of mercy—

Both him that gives, and him that takes.'

DREAM REVELATIONS.

AN article published in the Journal last summer, treating dreams on what we thought philosophical grounds, has brought to our hands a number of communications, detailing instances of what may be called dream revelations, most of them narrated by the individuals to whom they occurred. It is of course inconsistent with our ordinary ideas of nature, that any one can acquire a knowledge, while asleep, of events that are afterwards to take place; and it is desirable that our ideas of natural procedure should not be in any degree confounded by a propensity to vulgar marvels. At the same time, no one can be quite sure that such things are out of the range of nature; and even Dr Abercrombie has thought it not improper to introduce several of them into his 'Intellectual Philosophy,' apparently in the hope that they may yet be explained on some principle connected with recognised laws. For this reason, but chiefly because we think they will harmlessly entertain our readers, we make a selection from the communications in question. The first is from a lady, resident in a remote and insulated region of Britain, whose sprightly talents have already been repeatedly evidenced in these pages.

'Though happily, both by constitution and education, more free from all superstitious influences than most people, I have been often led to make remarks on the subject of dreams; so often, that I am inclined to believe, if all were to contribute their stock of personal experience on this point, it would be found that there are not more things in earth and heaven than are dreamt of in our philosophy. I merely here intend to put down, at random almost, a very few of what I remember of my own experiences in the way of dreaming. In most of the instances when my dreams have been almost literally fulfilled, the recollection of them has only occurred to me on their fulfilment, which generally happens very speedily. On one occasion last winter, I imagined I was in church in the front seat of the side gallery, and while engaged in prayer, I saw some persons carry in a plain coffin into the lower area. The silence that ensued was breathless; and I was saying to myself, as I supposed each one was doing, "Is this for me?" when the coffin-bearers looked at me, and said solemnly, and in tears, "It is for —," naming me. I awoke immediately. I was then in perfect health; but only the second day thereafter, I was most unexpectedly and dangerously taken ill, and for three months was frequently very near death; so that I never before had such a close view of an eternal world. It was not till I had nearly quite recovered, that my dream was recalled to my remembrance, by being told that a certain neighbour—none other than the chief coffin-bearer—had wept abundantly while my life was considered in danger.

'Earlier in life, I once dreamt I was bathing, and was dragged beyond my depth, near to drowning, by a particular friend; and was only rescued by my husband wading in with his clothes on, and seizing me as I was sinking. Within a week I was brought into an affecting dilemma by that same friend, and only relieved by the instrumentality of the same protecting hand.

'What led me at first to put down these remarks was, that the night, or rather morning before last, I had a very distressing dream of one of my little girls, four years old, being killed by the falling of the peat-stalk upon her; and last evening I was sitting alone, reading the article in Chambers's Journal on dreams, when I was startled by the most extraordinary rumbling noise and screams. On running to see what was the matter, I found the little girl alluded to had tumbled down the whole stair with a straw basket full of peats, which she had succeeded, with the love of enterprise

so common in children, in dragging up stairs to take to the nursery fire. The dear child, and the peats together, rumbling down a long wooden stair, were sufficiently alarming; but, happily, she was only frightened. The straw basket had preserved her at the foot uninjured, and I could soon laugh heartily at the incident, which I hope will stand for the fulfilment of my dream.

'With respect to presentiment, my experience has not been great; but has any person besides myself ever felt, in particular societies, or circumstances, or scenery, as if the scene were not new to him, but only the exact repetition of circumstances, conversation, and other particulars which he had been present at on some former occasion, though undoubtedly he actually never had? Often have I felt this, and it always appears as if I were remembering what had taken place in a dream.'

Our fair correspondent may rest assured that she is not singular in the latter class of experiences. They are very general amongst persons of a nervous organisation. One theory about them, more interesting than convincing, is that they are the reminiscences of an earlier state of existence.

The following anecdote is from a gentleman residing at Douglas, in the Isle of Man:—'My brother, —, was in the Bush Hotel, in Bristol, one day in 183-, when the Welsh mail arrived, and a gentleman named J—, with whom he was acquainted, walked into the coffee-room. As they sat in conversation, the melancholy news arrived of the loss of the Frolic steamer upon the Naas, with all on board. Hereupon Mr J— assumed a look of unusual seriousness, and seemed deeply affected. My brother inquiring the reason, he said he felt as if he had been just rescued from a violent death. He had designed two mornings before to leave Haverfordwest by that steamer, but was prevented by the intreaty of his wife, who had awoke during the night from a terrible dream, in which she had seen the loss of the vessel during a heavy gale. Merely to calm her mind, he had put off his journey for a day, and travelled by the mail instead; by which means his life undoubtedly had been saved.' It may be remarked, that there might be nothing here beyond simple coincidence. The weather might be threatening, and the lady's dream produced by previous waking fears.

The following instances are more curious. They come from a gentleman engaged in legal business at a town in the south of Scotland:—

'Most of the writers,' he says, 'on the subject of dreams, deal with those which have reference to past events. To this extent I could readily accede to their reasoning. It is easy to conceive that impressions may and do remain on the mind, and that control being suspended by sleep, these impressions may present themselves in a confused and undefined mass. We frequently find remote events curiously blended with those of recent occurrence. We find places we may have visited strangely associated with those which we have read about, or heard described. We meet with relatives long since dead, and have the full conviction that we are engaged with them as in former days; or it may be that we believe them to be dead, and yet we feel no surprise that we are conversing with them. We are sometimes breathlessly ascending a steep, and at other times suffocating in water. We are conscious of fear, joy, pain, &c. All these, and a thousand other vagaries, though sufficiently mysterious, we are ready to account for on the ground that they all have some reference to, or connexion with, what the mind has already been engaged in, and that, composed of these remnant impressions, the most vivid of them present themselves when uncontrolled by the senses. I would even go a little further with this theory. Suppose a person labouring under great anxiety for the recovery of a sick relative, or for the favourable issue of some undertaking in which he is deeply interested, it often happens that, in a dream, the death of the former, and the failure of the latter, take place by anticipation. It would not be held that there was any preternatural communication of these events,

because they were actually realised. Anxiety implies a dread of these results, and it is not to be wondered at that that impression should assume the appearance of an occurrence actually realised. This theory is, however, greatly unbinged and dissipated when we come to deal with cases—unquestionable and well-authenticated cases—where events are distinctly and minutely portrayed, of which it is utterly impossible the mind could have any anticipation, and which, even after awaking from the dream, there is no reasonable ground for supposing likely to be realised. Moreover, when even dates are condescended on, and the realisation comes exactly to correspond with the dates and representation in the dream, then the difficulty, not yet overcome, presents itself. It is not easy in such cases to assent to the abandonment of the mind to its own uncontrolled vagaries, as if it were a mere wheel of a vast machine left to go at random, while all the rest is still. Its random effusions are conceivable until we come to this point—events anticipated or foretold, if I may use the expression. It is said that these are the exceptions, not the rule—that striking dreams of future events do happen, and by chance may turn out to be realised; but that there can be no connexion between the dream and the event; and that in ninety cases out of a hundred, events may be dreamt of which never do take place. I shall not venture to grapple with the question, but shall briefly state what has occurred in my own experience.

In the autumn of 1835, I dreamt that a near relative of my own, who died two years before, came to my bedside. I felt fully conscious of being in my own bed, and of raising myself on my elbow when my friend approached. I was also fully sensible that he was dead; and though in his morning gown, his countenance bore the impress of death. He mentioned my name, and presented to me a coffin-plate bearing the name, age, and date of the death of a lady—the latter was 25th December 1835. I said, "Where have you got that? Mrs — is still in life; and besides, the date there has not yet arrived." He answered, "Take it, and keep it for her; she will require it." This lady was no relative of mine; I was only slightly acquainted with her. She was married, and had gone to a distance a considerable time before, and I had never seen nor heard of her since. When at breakfast, I in a casual way mentioned my dream, when some one jocosely remarked that I must have been thinking of her, and that to dream of deaths was always a marriage, and that my dream must have reference to her marriage. We thought no more of the matter, nor did it particularly attract the attention of any of us, until, in the course of the day, a lady happened to call, and in course of conversation asked if we had heard of the distressing illness of Mrs —.

We all declared we had not; when the lady stated that she passed through a neighbouring town yesterday on her way to her father's house, from the north, and that she was so ill, that she was obliged to remain some time at a friend's house before she could proceed. This was so far an association with the dream, that it struck all of us as a remarkable coincidence. The more extraordinary part remains to be told. On 31st December 1835 I attended her funeral, and the coffin-plate, with age and date as distinctly delineated in the dream, presented themselves to my gaze. It is needless to observe, that the impression on my mind was of a very peculiar kind, and equally so on the minds of those who some months before had heard the narrative of the dream.

Another striking, though less interesting case, occurred of a more recent date. I dreamt that, on going into my office in the morning, I found seated at his usual desk a clerk who had left me a twelvemonth or more previously, and had since been in Edinburgh, where I had little or no communication with him. I said, "Mr D., how do you happen to be here; where in the world have you come from?" I had the most distinct answer, that he had come to the country for a few days, and, with my leave, would wish for a day to enjoy the re-

miniscence of his former happy feelings at that desk. I replied—"Certainly; I am glad to see you. Write that deed, and then take your dinner with me." Such was the dream; and though apparently of no importance, I happened to observe at the breakfast table that I had dreamt my old clerk D. had returned to my office. After having walked out half an hour, I directed my steps to the office, and my surprise was not a little excited when I found Mr D. seated exactly as had been represented in the dream. It might be supposed that, following out the dream, I put the question which it had suggested; but I am sure it was on the spur of the moment, and without reference to the dream, that I put that question, and my astonishment was doubly aroused when his answer corresponded almost verbatim with what I have stated. I immediately returned and stated the circumstance to my friends, who would only be satisfied of the fact by my calling Mr D. into their presence.

I shall just notice one further instance, out of many equally striking, in my experience. My wife and I, with our only child—a girl of about a year old—were at a friend's house some miles from home. The child was then in perfect health. I dreamt that, on going to my room, I found my wife walking about with the child in her arms, closely wrapt in a shawl. I had the impression that she was in health. I opened the shawl to take the child in my arms, and what was my horror to see only a withered branch in place of my blooming child. It was but a dream; but so painful was the impression, that I could not help saying to a friend in the morning that I dreaded we were to lose our child, I had had so unpleasant a presentiment from my dream. He ridiculed the idea; but within one short month the darling branch gradually withered, and was consigned to an early tomb. This is one of those cases which is not wrapt in so much mystery, as it may be conceived that a parent's anxiety, even about a healthy child, might present itself in a dream in some distorted form. Still, it is an illustration of the mystery attending the mind when the senses are prostrated.

I shall just mention one case which was told to me by an advocate. He had arranged to accompany a friend to Newhaven to bathe, and they were to set out at six o'clock in the morning. Immediately before getting out of bed, he dreamt that he was struggling in the water to save a young man from drowning. Within little more than an hour of the dream, he was in reality engaged in saving the life of a boy. He had just reached the sea-side, when he saw the boy beyond his depth, and without fully undressing, he rushed in and saved him.

I could not have the slightest hesitation in giving you the names of every one to whom I have referred in these observations, though I should neither like their names nor my own to be made public.

STATUE OF PETER THE GREAT, ST PETERSBURG.

THE rapid change which Russia underwent during the reign of Peter the Great, her extraordinary advances under this sage legislator, are among the most important events of which history preserves the record. Proud of his glory, the nation wished to erect a monument in commemoration of his great actions, which in his own city should be a distinctive object to all posterity. In the then young state of their art, some deliberation took place before the design of the structure was decided on: during this the hero died, and the erection of the monument was consequently reserved for the reign of the empress Catherine II. The first step to be taken was the appointment of an artist capable of undertaking such a work. The choice fell upon M. Falconet, who, in his conception of an equestrian statue, determined that the subordinate parts should bear an equal impress of genius. He found that the pedestals in general use have no distinctive feature, and adapt them-

selves equally well to any subject; and being of so universal application, they produce no new or elevated feeling in the mind of the spectator. He wished to make the czar appear in his principal character—the father and legislator of his people; great and extraordinary in all; undertaking and completing that which others were unable to imagine. To carry out this conception, a precipitous rock was fixed on for the pedestal, on which the statue should appear with characteristics distinguishing it from those erected to other sovereigns.

The first idea was to form this pedestal of six masses of rock, bound together with bars of copper or iron; but the objection was urged, that the natural decay of the bands would cause a disruption of the various parts, and present a ruinous aspect, while it would be difficult to insure perfect uniformity in the quality and appearance of the different blocks. The next proposal was to form it of one whole rock; but this appeared impossible; and in a report to the senate, it was stated the expense would be so enormous, as almost to justify the abandonment of the undertaking; and even if made of six pieces, as first proposed, the outlay would be excessive. At length it was determined to transport to the city the largest rock that could be found, and add other portions to it as might be judged necessary. Still, great misgivings prevailed as to the possibility of removing the contemplated mass. The search was then begun, but with less success than had been anticipated, as the country around St Petersburg is flat and marshy, affording no traces of stone, while the nearest mountains are in the province of Finland. A whole summer was passed in exploration; and the idea of forming the pedestal of several smaller portions was again entertained, when a large stone was discovered near Cronstadt, which it was determined to apply as the principal mass; and the task of its removal was confided to the Admiralty, who, however, as well as many other mechanicians applied to in turn, refused to undertake it. The search for the smaller blocks was nevertheless continued, although no one appeared to have any definite notion of the use to be made of them in the event of their discovery.

Under these unexpected difficulties, the formation of the pedestal was intrusted to an officer of the corps of cadets, who had already given proofs of his mechanical skill. A native of Cephalonia, he had been compelled, for an offence against the laws, to seek refuge in Russia, where he lived under the assumed name of Lascary. He had strenuously recommended the adoption of the original design; and a few days after his appointment, he received information from a peasant of a large rock lying in a marsh near a bay in the Gulf of Finland, about twenty miles from the city by water. An examination was immediately instituted: the stone was found covered with moss; and on sounding around it, the base was fortunately ascertained to be flat. Its form was that of a parallelepipedon, 42 feet in length, 27 feet in width, and 21 feet in height—dimensions sufficiently extensive to realise the conceptions of M. Falconet, the sculptor. But when the authorities, under whose direction the work was placed, saw the prodigious size of the rock, they again hesitated, and recommended its division into smaller portions. The fear of accidents, however, and the hardness of the stone, caused them to yield to the representations of the engineer, who was now favoured by the support and encouragement of the minister Betzky; and the intelligence of the empress being superior to the senseless clamour raised by the envious and the ignorant, she gave orders for the commencement of the work.

A working model of the machinery with which it was proposed to remove the rock from its situation was first made. M. Lascary resolved on effecting this removal without the use of rollers, as these not only present a long surface, which increases the friction, but are not easily made of the great diameter that would have been required, owing to the soft and yielding nature of

the ground on which the work was to be performed. Spherical bodies, revolving in a metallic groove, were then chosen as the means of transport. These offered many advantages. Their motion is more prompt than that of rollers, with a less degree of friction, as they present but small points of contact. Stout beams of wood, 33 feet in length, and 1 foot square, were then prepared. One side was hollowed in the form of a gutter, and lined, the sides being convex, to the thickness of two inches, with a compound metal of copper and tin. Balls of the same metal, five inches in diameter, were then made, to bear only on the bottom of the groove. These beams were intended to be placed on the ground in a line, in front of the stone, while upon them were reversed two other beams, prepared in a similar manner, each 42 feet long, and 1½ feet square, connected as a frame by stretchers and bars of iron 14 feet in length, carefully secured by nuts, screws, and bolts. A load of 3000 lbs., when placed on the working model, was found to move with the greatest facility; and the inventor hoped to satisfy the minister as well as the mechanicians by its public exhibition. The former was well pleased with the experiment, and expressed his belief in the possibility of removing the stone; while the latter raised absurd objections, with the cry of 'the mountain upon eggs.'

The first thing to be done, as the rock lay in a wild and deserted part of the country, was to build barracks capable of accommodating 400 labourers, artisans, and other persons required, who, with M. Lascary, were all lodged on the spot, as the readiest means of forwarding the work. A line of road was then cleared from the rock to the river Niva, a distance of six versts,* to a width of 120 feet, in order to gain space for the various operations, and to give a free circulation of air, so essential to the health of the workmen in a marshy district, as well as to the drying and freezing of the ground—a point of much importance, when the enormous weight to be removed is considered. In the month of December, when the influence of the frosts began to be felt, the operation of disinterring the rock from the earth, in which it was imbedded to the depth of 15 feet, was commenced: the excavation required to be of great width—84 feet all round—to admit of turning the stone, which did not lie in the most favourable position for removal. An inclined plane, 600 feet in length, was afterwards made, by means of which, when the stone was turned, it might be drawn up to the level surface.

Among the objections urged against the possibility of removing the rock, was the anticipated insurmountable difficulty of placing it upon the machine destined for its transportation. But the engineer was confident, and wisely preferring simplicity to complication, resolved on employing ordinary levers, known technically as levers of the first order; these were made of three masts, each 65 feet in length, and 1½ feet in diameter at the larger end, firmly bound together. To diminish the difficulty of moving these heavy instruments, triangles 30 feet high were erected, with windlasses attached near the base, from which a cord, passing through a pulley at the top, was fastened to the smaller end of the lever, which, being drawn up to the top of the triangle, was ready for the operation of turning: each of these levers was calculated to raise a weight of 200,000 lbs. A row of piles had been driven into the ground at the proper distance from the stone on one side, to serve as a fulcrum; and on the other a series of piles were disposed as a platform, to prevent the sinking of the mass on its descent. Twelve levers, with three men to each, were stationed at the side to be lifted, and the lower extremities being placed under the mass, the upper ends were drawn downwards by the united action of the twelve windlasses. When the stone rose to the height of a foot, beams and wedges were then driven underneath, to maintain it in that position, while the levers were arranged

* A verst is 3500 English feet.

for a second lift. To assist the action of the levers, large iron rings were soldered into the upper corner of the rock, from which small cables were passed to four capstans, each turned by 36 men, thus maintaining a steady strain; while the stone was prevented from returning to its original position when the levers were shifted. These operations were repeated until the rock was raised nearly to an equipoise, when cables from six other capstans were attached to the opposite side, to guard against a too sudden descent; and as a further precaution against fracture, a bed, six feet in thickness, of hay and moss intermingled, was placed to receive the rock, on which it was happily laid at the end of March 1769. As it was of great importance that all the workmen should act at one and the same time, two drummers were stationed on the top of the stone, who, at a sign from the engineer, gave the necessary signals on their drums, and secured the certainty of order and precision in the various operations.

Meantime the machinery for the removal had been made. Of the lower grooved beams already described, six pairs were prepared, so that when the rock had advanced over one pair, they might be drawn forward and placed in a line in advance of the foremost, without interrupting the movements. The balls were laid in the grooves 2 feet apart; the upper frame, intended as the bed for the rock, placed above: the mass, weighing in its original form 4,000,000 lbs., was then raised by means of powerful screws, and deposited on the frame, when it was drawn up the inclined plane by the united force of six capstans. The road did not proceed in a direct line to the river, owing to the soft state of portions of the marsh: in many places it was impossible to reach a firm foundation with piles 50 feet in length. This naturally added to the difficulties of the transport, as the direction of the draught was frequently to be changed. Piles were driven along the whole line on both sides, at distances of 300 feet apart: to these the cables were made fast, while the capstans revolved; two of which were found sufficient to draw the stone on a level surface, while on unequal ground four were required. The rate of motion was from 500 to 1200 feet daily, which, when regard is had to the short winter days of five hours in that high latitude, may be considered as rapid. So interesting was the spectacle of the enormous mass when moving, with the two drummers at their posts, the forge erected on it continually at work, and forty workmen constantly employed in reducing it to a regular form, that the empress and the court visited the spot to see the novel sight; and, notwithstanding the rigour of the season, crowds of persons of all ranks went out every day as spectators. Small flat sledges were attached to each side of the stone by ropes, on which were seated men provided with iron levers, whose duty it was to prevent the balls, of which fifteen on a side were used, from striking against each other, and thus impeding the motion. The tool-house was also attached, and moved with the stone, in order that everything might be ready to hand when required. Experiments were tried with balls and grooves of cast-iron; but this material crumbled into fragments as readily as if made of clay. No metal was found to bear the weight so well as the mixture of copper and tin; and even with this the balls were sometimes flattened, and the grooves curled up, when the pressure by any accident became unequal. The utility of rollers was also tried; but with double the number of capstans and power, the cables broke, while the stone did not advance an inch.

The work went on favourably, when it was suddenly checked by the sinking of the stone to a depth of 18 inches in the road, to the great chagrin of the engineer, who was suffering under a severe attack of marsh fever. He was not, however, disheartened, and speedily remedied the accident, spite of the idle clamours of the multitude; and in six weeks from the time of first drawing the stone from its bed, he had the satisfaction of seeing it safely deposited on the temporary wharf built for the purpose of embarkation on the banks of the river.

when the charge fell into the hands of the Admiralty, who had undertaken the transport by water to the city.

A vessel or barge 180 feet in length, 66 feet in width, and 17 feet from deck to keel, had been built with every appliance that skill could suggest, to render it capable of supporting the enormous burden. Great precautions were now necessary to prevent the possibility of the falling of the rock into the stream: water was let into the vessel until she sunk to the bottom of the river, which brought her deck on a level with the wharf; the rock was then drawn on board by means of two capstans placed on the deck of another vessel, anchored at some distance from the shore. Pumps and buckets were now brought into use to clear the barge of the water with which she had been filled; but to the surprise and consternation of those engaged, she did not rise equally: the centre, bearing most of the weight, remained at the bottom, while the head and stern, springing up, gave to the whole the form of a sharp curve: the timbers gave way, and the seams opening, the water re-entered rapidly: 400 men were then set to bale, in order that every part might be simultaneously cleared; but the curve became greater in proportion to the diminution of the internal volume of water.

M. Lascary, who, from the time the rock had been placed on the deck of the vessel, had been a simple spectator of these operations, which occupied two weeks, now received orders to draw it again upon the wharf. He immediately applied himself to remedy the error—which had been committed in not distributing the weight equally—without removing the stone. He first caused the head and stern of the barge to be loaded with large stones, until they sank to a level with the centre; the rock was then raised by means of screws and beams of timber, diverging to every part of the vessel, placed under and against it; and on the removal of the screws, the pressure being equal in every part, she regained her original form. The water was next pumped out, the stones removed from the head and stern, a ship lashed on each side of the barge, which, on the 22d September, arrived opposite the quay where it was intended to erect the statue.

Not the least difficult part of the work, the debarkation, remained to be done. As the river was here of a greater depth than at the place of embarkation, rows of piles had been driven into the bottom alongside the quay, and cut off level at a distance of eight feet below the surface: on these the barge was rested; and, to prevent the recurrence of the rising of the head and stern when the supports should be removed, three masts, lashed together, crossing the deck at each extremity, were secured to the surface of the quay. It was then feared that, as the rock approached the shore, the vessel might heel and precipitate it into the river. This was obviated by fixing six other masts to the quay, which projected across the whole breadth of the deck, and were made fast to a vessel moored outside; thus presenting a counterpoise to the weight of the stone. The grooved beams were laid ready, the cables secured, and at the moment of removing the last support, the drummers beat the signal: the men at the capstans ran round with a cheer; the barge heeled slightly, which accelerated the movement; and in an instant the rock was safely landed on the quay.

Such was the successful result of an undertaking, extraordinary in its nature and the circumstances in opposition to it.* An example is here afforded to those who may have to struggle with difficulties in mechanical art, that will stimulate them to attempt what may appear impossible to the timid and unreflecting. He who contends successfully with the adverse opinions of men of learning, and the blind prejudices of the multitude, achieves a moral as well as a physical triumph, deserving of high praise and imitation.

* The whole expense of the removal did not exceed 70,000 roubles, or £14,000; while the materials which remained were worth two-thirds of the sum.

It is to be regretted that the effect of this unrivalled pedestal was marred by the diminution of its size. Under the directions of the artist who had so successfully formed the statue, it was pared and chiseled, until the weight was reduced to 8,000,000 lbs.; and the outline, instead of being left bold and broken, as best suited the character of the group, was made smooth and uniform. It forms, however, one of the chief attractions of St Petersburg, standing 'in the square opposite the Isaac Bridge, at the western extremity of the Admiralty. Here the colossal equestrian statue of the founder of this magnificent city, placed on a granite rock, seems to command the undivided attention of the stranger. On approaching nearer, the simple inscription fixed on it, in bronze letters, "Petro Primo, Catharina Secunda, MDCCCLXXXII," meets the eye. The same inscription in the Russian language appears on the opposite side. The area is enclosed within a handsome railing, placed between granite pillars. The idea of Falconet, the French architect, commissioned to erect an equestrian statue to the extraordinary man at whose command a few scattered huts of fishermen were converted into palaces, was to represent the hero as conquering, by enterprise and personal courage, difficulties almost insurmountable. This the artist imagined might be properly represented by placing Peter on a fiery steed, which he is supposed to have taught, by skill, management, and perseverance, to rush up a steep and precipitous rock, to the very brink of a precipice, over which the animal and the imperial rider pause without fear, and in an attitude of triumph. The horse rears with his fore-feet in the air, and seems to be impatient of restraint, while the sovereign, turned towards the island, surveys with calm and serene countenance his capital rising out of the waters, over which he extends the hand of protection. The bold manner in which the group has been made to rest on the hind legs of the horse only, is not more surprising than the skill with which advantage has been taken of the allegorical figure of the serpent of envy spurned by the horse, to assist in upholding so gigantic a mass. This monument of bronze is said to have been cast at a single jet. The height of the figure of the emperor is 11 feet, that of the horse 17 feet. The bronze is, in the thinnest parts, only the fourth of an inch, and one inch in the thickest part; the general weight of metal in the group is equal to 36,636 English lbs.*

MISCELLANEA.

A justifiable pride is felt in the beautiful public buildings of our cities, and the handsome residences of the higher classes in both town and country. But, as some one has remarked about the magnificent ceremonial religion of the middle ages, that it co-existed with barbarism in the people, so may it be observed of our fine buildings, that they—disgracefully to us as a community—stand side by side with dwellings for the humbler classes, which are hardly advanced from those of the most primitive state of society. Read on this subject the following remarks by Professor Low, in his recent work on the Management of Landed Property:—

'The subject of the dwellings of the rural population, whether they exist as detached cottages, or as groups of houses, in the form of hamlets or villages, merits more regard than has hitherto been paid to it. They who have been used to see only the decent habitations of the peasantry of many parts of England, can have but a faint conception of the state of the same class of dwellings over the larger part of the British islands. If we shall pass into Ireland, we shall find the country covered from end to end with huts and cabins of mud, even more wretched within than their ragged exterior indicates. The damp earth generally forms the floor, a hole in the roof allows the smoke to escape, the windows are holes usually stuffed with rags, and wood is wanting in every part. One wretched chamber contains the inmates, without distinction of age or sex; some huddled in filthy pallets, or on rude benches of planks, nay, on straw or heath spread on the ground. The fire of

*turf on the ground fills the shed with dust and smoke; while the refuse of wretched repasts, heaps of rags, nay, the filth of pigs and fowls, poison the air within. In such dens as these, fitter for the abodes of beasts than of men, dwell millions of peasants who have known no better lot. Can we wonder that, under such a condition of life, gross habits should prevail, and men be rude and reckless! * **

'Scotland, with respect to the habits of the peasantry, is in a somewhat different condition, although the dwellings of this class are in many cases as mean and wretched as those of the sister country. In Scotland, two very distinct races of peasants exist, the one of mixed lineage, but chiefly of Teutonic blood, inhabiting the lowland countries, and the other of Celtic descent, possessing the countries of the higher mountains. The lowland peasants are generally labourers employed upon the farms. In the southern counties, as well as in the north-eastern part of England, the principal servants of the farm are married persons, who engage their services for a specified time, almost always twelve months, and who receive wages partly in money, but chiefly in the produce of the farm, together with the use of cottages, small gardens, cows kept upon the farm, and other conveniences. The persons thus treated form the best class of farm-labourers of the British islands. They are hard worked from an early age, but they have all been educated, thoroughly understand the duties of their condition, and lead a life more tranquil and contented than the same class of labourers in any other part of the country. To the establishment of this admirable system of farm-economy, is due that practice of steady and regular labour by which the works of the farm are conducted with order throughout the year. The system prevails more or less throughout all the lowlands of Scotland, although with far less regularity in the northern than in the southern counties, where it has been the established practice of the farms time out of mind.

'But the existence of the system has led to certain peculiarities, and great defects, with respect to the construction of the dwellings possessed by the labourers. For carrying it into effect, it has sufficed that the cottagers should receive merely a rude room, sometimes with, but oftener without, a loft above. The labourers themselves possess a simple kind of furniture, which they call plenishing, consisting of large box-beds with sliding doors, chests for clothes, and shelves for plates and dishes. This furniture, with the common utensils of the household, as blankets and coarse linen, constitute, together with the cow, which is to supply the family with a great part of their food, the little stock or capital of the inmates. Until this can be obtained, the young peasant is not regarded as in a condition to enter into the state of matrimony and begin house-keeping; and this simple check, itself an inducement to habits of frugality, does more to prevent reckless unions than many moral lessons could effect. By the possession of their homely furniture, the married pair are enabled to fit up their rude room in a manner more consistent with humble comfort and decency than could be imagined. The closed box-beds are so large, that they serve in part for dressing and wardrobes. They are usually disposed in such a manner across the room, that it can be divided into two, and in this manner the separation of the members of the family is better promoted than, from the smallness of the apartments, would seem to be attainable. Yet the houses are exceedingly mean, ill fitted up, and comfortless. The floor is generally unpaved, consisting of an imperfect composition, or often merely of earth rammed hard. The fire is, for the most part, on the hearth, underneath a large chimney, too wide for allowing the apartment to be warmed, or even for carrying up the smoke. The windows are ill-constructed either for ventilation or warmth, and the doors are hung in such a manner as to allow the cold winds to penetrate the little chamber; and often the roofs are so ill formed or decayed as to admit the rain. Since the commencement of the present century, however, considerable attention has been paid to the improvement of this class of buildings, and almost always when the old ones have been taken down, new ones have been substituted, superior with respect to size, materials, and fitting up. Nevertheless, there are great numbers of the old buildings still in existence, and of the new ones, the greater number have received nothing like the improvement of which, by a slight pecuniary sacrifice, they are susceptible. The general defects of these new cottages are the want of proper flooring and lofting. If the practice before recommended were adopted, of raising the side walls, so that space for sleeping

* Granville's Travels to St Petersburg.

were to be given above, a great degree of additional accommodation could be afforded, and it may be said all the humble desires of the inmates, with respect to their dwellings, would be fulfilled. When we consider the high importance of preserving, to the peasantry of Scotland, the system of household economy which has been so happily established amongst them, the owners of estates should not begrudge the little sacrifice required of them to render this class of buildings suited to the modest wants of their peasantries.

While the system of married labourers residing in their separate cottages, is beyond all question that which is the best adapted for maintaining the character which has hitherto distinguished the lowland peasantry of Scotland, it is to be regretted that considerations of ungenerous economy have, in many parts of the same country, introduced a different system, which has had the effect of destroying the older hamlets and farm-cottages, without providing a substitute. Under this system, the married labourers are as much as possible dispensed with, and lads only are taken, for whom a single cottage is built, termed a boothie or bothy. In this the poor youths are placed, free from all the restraints which should surround them in early life, mixed together, of every character, obliged to prepare their own food, and attend to their own wretched household. What can be expected under such a system but contamination of the youthful habits, and the neglect of all those decencies which may become the charm of the humblest cottage? There is a little saving in wages to the farmer, but the real gain is to the landlord, who avoids the erection of the necessary buildings. If there were suitable cottages, the young lads could board themselves in them as members of the family; or why should the decent, farmer-like, and honest practice be abolished, so general in England, of allowing the young labourers to live in the farm-house? But whatever be the course pursued, it will be scandalous to the landed proprietors of Scotland to permit the youthful peasants of their country to be corrupted by the want of a few decent cottages upon the farms.

The two following anecdotes were found literally following each other, apparently by accident, in a newspaper:—

NAPOLÉON CROSSING THE ALPS.—Artists have delineated him crossing the Alpine heights mounted on a fiery steed. The plain truth is, that he ascended the St Bernard in the gray surtout which he usually wore upon a mule, led by a guide belonging to the country, evincing, even in the difficult passes, the abstraction of a mind occupied elsewhere, conversing with the officers scattered on the road, and then, at intervals, questioning the guide who attended him, making him relate the particulars of his life, his pleasures, his pains, like an idle traveller who has nothing better to do. This guide, who was quite young, gave him a simple recital of the details of his obscure existence, and especially the vexation he felt because, for want of a little money, he could not marry one of the girls of his valley. The first consul, sometimes listening, sometimes questioning the passengers with whom the mountain was covered, arrived at the Hospice, where the worthy monks gave him a warm reception. No sooner had he alighted from his mule than he wrote a note, which he handed to his guide, desiring him to be sure and deliver it to the quarter-master of the army, who had been left on the other side of the St Bernard. In the evening, the young man, on returning to St Pierre, learned with surprise what powerful traveller it was whom he had guided in the morning, and that General Bonaparte had ordered that a house and a piece of ground should be given to him immediately, and that he should be supplied, in short, with the means requisite for marrying, and for realising all the dreams of his modest ambition. This mountaineer died not long since in his own country, the owner of land given to him by the ruler of the world. This singular act of beneficence, at a moment when his mind was engaged by such mighty interests, is worthy of attention. If there were nothing in it but a mere conqueror's caprice, dispensing at random good or evil, alternately overthrowing empires or rearing a cottage, it may be useful to record such caprices, if only to tempt the masters of the earth to imitation. But such an act reveals something more. The human soul, in those moments when it is filled with ardent desires, is disposed to kindness; it does good by way of meriting that which it is soliciting of Providence. —*Thiers' History of the Consulate and Empire.*

NELSON'S KINDNESS OF HEART.—Nelson's kindness of heart exhibits itself everywhere. Scarcely can a page of

his correspondence be opened without some evidence of his affectionate disposition. Habitually, he treated all under his command, down to the very powder-monkey, as his children; and they had for him a love as for a father. In a private letter to his brother, speaking of his midshipmen, he calls them by the very name—"all my children are well," he says. A letter from Lady Hughes, describing a scene on board the Boreas, in which she was a passenger, is beautiful:—"I was too much affected when we met at Bath to say every particular in which was always displayed the infinite cleverness and goodness of heart of our beloved hero. As a woman, I can only be a judge of those things which I could comprehend—such as his attention to the young gentlemen who had the happiness of being on his quarter-deck. It may reasonably be supposed that, among the number of thirty, there must be timid as well as bold; the timid he never rebuked, but always wished to show them he desired nothing of them that he would not instantly do himself; and I have known him say, "Well, sir, I am going a race to the mast-head, and beg I may meet you there." No denial could be given to such a wish, and the poor fellow instantly began his march. His lordship never took the least notice with what alacrity it was done; but, when he met in top, instantly began speaking in the most cheerful manner, and saying how much a person was to be pitied that could fancy there was any danger, or even anything disagreeable, in the attempt. After this excellent example, I have seen the timid youth lead another, and rehearse his captain's words. How wise and kind was such a proceeding! In like manner he every day went into the school-room, and saw them at their nautical business; and at twelve o'clock he was first upon deck with his quadrant. No one there could be behind-hand in their business when their captain set them so good an example. One other circumstance I must mention, which will close the subject, which was the day we landed at Barbadoes. We were to dine at the governor's. Our dear captain said, "You must permit me, Lady Hughes, to carry one of my aides-de-camp with me;" and, when he presented him to the governor, he said, "Your excellency must excuse me for bringing one of my midshipmen, as I make it a rule to introduce them to all the good company I can, as they have few to look up to besides myself during the time they are at sea." This kindness and attention made the young people adore him; and even his wishes, could they have been known, would have been instantly complied with.—*Despatches and Letters of Admiral Lord Nelson.*

How curious thus to learn at length of traits of simple kind feeling in two men of whom, in our youth, while they were living, we used to hear only of their powers as agents of destruction among their fellow-creatures! Much less could these two 'heroes,' while pitted against each other like savage animals, conceive that in each other's bosoms there beat, after all, hearts that responded to the voice of social and domestic kindness. Above all, how sad to reflect that circumstances should ever be such, that men know each other only as deadly enemies, and devote their whole faculties to do each other injury, who, under happier auspices, would doubtless have gladly joined hands and hearts, and done what they could to promote each other's happiness, and that of all in whom they respectively felt interested!

BAD BREAD.

At a recent meeting of the members of the Devon and Cornwall Natural History Society, Dr Tripe read a paper on 'ropy bread,' in the course of which he stated that the state of bread termed 'ropy' was generally admitted to depend on the presence of fungi. Recent writers on the subject agreed in attributing the ropy state of bread to the presence of fungi. And they all accounted for the presence of fungi on the ground of the quality of the flour; but he thought it might in all probability originate from three causes—that of atmosphere, from yeast, which he thought the main cause, and from the flour. With respect to yeast, he said it appeared, from a microscopic examination of a mass of yeast, that it consists of minute disconnected vesicles, that appear to constitute one of the simplest forms of vegetation. These, like seeds, may remain for any length of time in an inactive condition without losing their vitality; but when placed in a fluid in which any kind of sugary matter is contained, they commence vegetating actively, provided the temperature be sufficiently high, and they assist in producing that change

in the composition of the fluid which is known under the name of fermentation. Having referred to several opinions on fermentation, the learned gentleman went on to say, that if a small portion of the fermenting fluid be examined at intervals with a powerful microscope, it is observed that each of the little vesicles at first contained in it puts forth one or more prolongations, which in time become new vesicles like their parents. These organs perform the same office, so that in a few hours the single vesicles have developed themselves into rows of five or six. This is not the only way, however, in which they multiply; for sometimes the vesicles burst, and emit a number of minute granules, which are the germs of new plants, and which soon develop themselves into additional cells. By the time that five or six vesicles are formed in each group, the fermentation is sufficiently far advanced for the purposes to which it is to be applied, and measures are then taken to check it, by which the vegetation of the yeast plant is checked. If they could suppose any circumstance to arise by which the vegetation of the yeast was not suspended, or after it was checked and the yeast amalgamated with the flour, for the vegetation again to be active, they would have a sufficient cause for the origin of fungi in bread. The progress of the disease, as it may be called, in bake-houses, from one lot of bread to another, was elaborately gone into and pointed out, and instances were cited in which its ravages had prevailed to the extent of even ruining the bakers. As a remedy, he suggested ventilation, fumigation with chlorine, and the application of cold instead of hot washing. At the conclusion of the reading of the paper, a committee was appointed to inquire and report upon the subject.—*Plymouth Times*.

THE QUEEN'S PAPER AND INK.

Under this title certain new inventions have been patented, which combine in a remarkable degree utility with elegance. The ink is a limpid and colourless liquid, and not distinguishable by the eye from pure water. The paper is of two kinds, both like common writing-paper in appearance, and the ink is used with a quill or metallic pen in the ordinary way. If the one species of paper is employed, the writing executed with the colourless liquid is of a tint approaching to black; if the other species of paper is employed, it is a clear blue. The liquid has the farther advantage, that it does not stain the fingers, or anything with which it comes in contact. Having tried the mode of writing with these articles, we can bear testimony to its cleanliness and elegance, and we are not surprised that her majesty, after using them, permitted them to be styled 'her majesty's paper and ink.' The same ingenious person has invented an 'indelible ink' for records, which promises to be very valuable. Other inks so named only profess to protect the writing from obliteration by long exposure to the elements, but the ink we are now speaking of resists even chemical agents.—*Newspaper paragraph*.

ARTIFICIAL LIMBS.

At the Academy of Sciences in Paris lately, M. Magendie read, in the name of the committee of the academy, composed of MM. Gambey, Rayer, Velpeau, and himself, a report on an artificial arm, the invention of M. Van Petersen, a Dutch sculptor, and presented by him to the academy. The report was highly favourable to the ingenious and benevolent inventor. The members of the committee state that they had seen the apparatus tried upon five mutilated persons, and that it answered in every case admirably. One of these persons was an invalid who, in the wars of the empire, lost both arms, retaining only the mere stumps. With the aid of two of these artificial arms, he was able to perform many of the functions which had hitherto been performed for him by others. In presence of the committee, he raised, with one of the artificial hands, a full glass to his mouth, drank its contents without spilling a drop, and then replaced the glass on the table from which he had taken it. He also picked up a pin, a sheet of paper, &c. These facts are conclusive as to the mechanical skill evinced by M. Van Petersen, and which is particularly shown in the lightness of his apparatus, each arm and hand, with all its articulations, weighing less than a pound. The mode in which the motion is imparted to the articulations of the apparatus is exceedingly ingenious. A sort of stays is fixed round the breast of the person, and from this are cords made of catgut, which act upon the articulations according to the motion given to the natural stump of the arm. The invention fails only when the mem-

ber that is wanting has been entirely removed from the socket, which is of comparatively rare occurrence. The report ends by stating that M. Van Petersen's invention is superior to any substitute for the natural arm hitherto made, and expresses a hope that he will be able to get his artificial arms manufactured at so low a cost as to be accessible to poor persons and mutilated soldiers.—*From a French newspaper*.

ADVANTAGES OF A BOOK.

Of all the amusements which can possibly be imagined for a hard-working man, after his daily toil, or in its intervals, there is nothing like reading an entertaining book—supposing him to have a taste for it, and supposing him to have a book to read. It calls for no bodily exertion, of which he has had enough, or too much. It relieves his home of its dullness and sameness, which, in nine cases out of ten, is what drives him out to the alehouse, to his own ruin and his family's. It transports him into a livelier and gayer and more diversified and interesting scene; and while he enjoys himself there, he may forget the evils of the present moment fully as much as if he were ever so drunk, with the great advantage of finding himself the next day with his money in his pocket, or at least laid out in real necessities and comforts for himself and his family, and without a headache. Nay, it accompanies him to his next day's work, and if the book he has been reading be anything above the very idlest and lightest, gives him something to think of besides the mere mechanical drudgery of his every-day occupation—something he can enjoy while absent, and look forward with pleasure to return to. But supposing him to have been fortunate in the choice of his book, and to have alighted upon one really good and of a good class, what a source of domestic enjoyment is laid open! what a bond of family union! He may read it aloud, or make his wife read it, or his eldest boy or girl, or pass it round from hand to hand. All have the benefit of it—all contribute to the gratification of the rest, and a feeling of common interest and pleasure is excited. Nothing unites people like companionship in intellectual enjoyment. It does more, it gives them mutual respect, and to each among them self-respect—that corner-stone of all virtue. It furnishes to each the master-key by which he may avail himself of his privilege as an intellectual being, to

Enter the sacred temple of his breast,
And gaze and wander there a ravished guest—
Wander through all the glories of the mind,
Gaze upon all the treasures he shall find.

And while thus leading him to look within his own bosom for the ultimate sources of his happiness, warns him at the same time to be cautious how he defiles and desecrates that inward and most glorious of temples.—*Sir John Herschel*.

MENTAL CONTROL.

When we turn our serious attention to the economy of the mind, we perceive that it is capable of a variety of processes of the most remarkable and most important nature. We find also that we can exert a voluntary power over these processes, by which we control, direct, and regulate them at our will; and that when we do not exert this power, the mind is left to the influence of external impression, or casual trains of association, often unprofitable, and often frivolous. We thus discover that the mind is the subject of culture and discipline, which, when duly exercised, must produce the most important results on our condition as rational and moral beings; and that the exercise of them involves a responsibility of the most solemn kind, which no man can possibly put away from him.—*Abercrombie*.

CENSURE.

Censure, says an ingenious author, is the tax a man pays to the public for being eminent. It is folly for an eminent man to think of escaping it, and a weakness to be affected with it. All the illustrious persons of antiquity, and indeed of every age in the world, have passed through this fiery persecution. There is no defence against reproach but obscurity; it is a kind of concomitant to greatness, as satires and invectives were an essential part of a Roman triumph.—*Addison*.

STYLE.

WHAT is worth doing at all, is allowed to be worth doing well; and so fully is this maxim recognised in life, that the performance of anything in an inferior or *shabby* manner is always supposed to be indicative of a certain meanness of mind. In English ethics, therefore, shabbiness bears a very contemptuous interpretation, while its opposite—a disposition to do things handsomely, or in style—commands universal applause. Nor can there be anything unreasonable in this view of matters, looking at appearances as the exponent of internal convictions. It may be generally observed, that the man who performs an act in a handsome manner, is also the most generous and estimable. No man was ever truly great who attempted to do things by halves.

So inextricably interwoven with the framework of our ideas is this estimate of *manner*, that the doing of a thing 'in style' has become, in common speech, synonymous with excellence itself. My friend Jackson is so thoroughly imbued with this notion of style, that with him it has become a ruling principle of life. He has faith in style, and would as soon forego belief in the thing itself, as in the potency of the manner in which it appears. He keeps house in style, and certainly a more elegant or more comfortable mansion does not exist. Dwellings there may be more gaudy and expensive, but none, we are confident, in which there are more substantiality and taste, without any attempt at lacquering, or effort in getting up. To crown the whole, there is a certain style about his beautiful wife and children which makes one almost feel envious; and envious we would most decidedly be, did not we know in our hearts that they belong to a man most perfectly deserving of such a treasury of happiness. As with his house, so with his establishment in the city; for my friend is not above the necessity of applying his head to business. This place is a model of elegance and strength: the grounds are laid out in green-sward and shrubbery, and gravelled walks, albeit they lead to a four-storeyed factory. Enter this cotton palace, and the entire arrangements, the aspect of the machinery, and the conduct of the men and women, strike you at once that the whole is under the presiding genius of one who is fully determined 'to do things in style.' Follow his employés to the streets and to their homes, and you will find alike from their demeanour, their dress, and their residences, that they have caught, as it were by inoculation, the spirit of their master, and are equally actuated by the principles of style. If there are fewer tattered garments and filthy apartments among them than among any other equal number of the population, rest assured that style is at the bottom of the reformation; so true is it that like begets like, and that there is no surer mode of

raising a man's moral nature than by cultivating his perception of the chaste and beautiful. It is not, however, in what may be considered mere economical arrangements that Jackson's faith in manner predominates; he is equally guided by it in feeling and conduct. If he be called upon to subscribe for a distressed family, let him only be assured of their deserving necessity, and he hands his cheque for ten pounds with a willingness and sincerity of feeling that makes the gift doubly valuable. There is no hankering, no grumbling about the frequency of calls of this nature, no complaint of bad times, no prying inquisitiveness into circumstances, no railing at the improvidence of the poor; none, in short, of those obstacles which overwhelm the generosity of little souls, who have no notion whatever of the beauty of doing things in style. Again, let him be called upon in public meeting to subscribe for some city improvement, and his name goes down at once for one hundred or two hundred guineas, as the case may be; he hands the paper to his neighbours without boast or comment, leaving them to the conviction that, as usual, Jackson has done the thing in style. Nor is there any vanity in all this. To say that there is no pride, would be to talk absurdity; for a just and honourable pride must ever be at the foundation of self-respect; and it is self-respect that raises us above all that is mean, and heartless, and contaminating.

The public usually show a keen appreciation of style, and their verdict on this point is decisive for or against the individual who aspires to their favour. Let the premier come forward with a measure in which some great principle is involved—no matter what it be—if he present it boldly and frankly, without any equivocation or reserve, without any frittering or chopping which can lead to the suspicion of insincerity, then he is sure to be hailed with the merit of having done it in style. Be it a boon to be granted, or a necessity to be met, John Bull is equally indifferent, provided the thing be given or taken in a gentlemanly way. It is not the matter so much as the manner that puts him out of humour; he naturally hates all meanness and snivelling, but gloriously delights in affairs that are managed in style. The same standard he carries with him into private life. The heir who recently came to his estate, who keeps a fine equipage, converses with his tenants, improves his lands, and employs the peasantry, is applauded for living in style. The spendthrift or cheat may keep as gay an equipage, may have as many dogs and hunters; but the populace are not led to a false judgment by such appearances. We may hear of such a one living in 'grand style,' or in 'gay style;' but we never catch an echo of the satisfactory verdict that the spendthrift 'does it in style.' So it is with every other phase of conduct: a 'stylish' man is sure to be an elegant well-dressed person of gentle-

manly demeanour; as far removed above foppery and tinsel as he is above rage and vulgarity; and a man of this stamp, if requested to confer a favour, would rather frankly decline doing it at all, than be suspected of the meanness of not doing it in style. To be sure we occasionally hear of this or that person being 'quite in style,' or of certain things being 'rather stylish;' but these are mere satirical applications of the term, intended to ridicule that aping vanity which would take upon itself the airs, and dress, and qualities of a rank incompatible with its situation.

We are now called on to observe, that this idea of style relates to something deeper than externals. It is indeed a principle—a reality in mind, and a characteristic of things as essential to their excellence as the substance of which they are composed. The stones and blocks which constitute a house are still the same materials, whether they are piled as taken from the quarry, or chiselled and arranged with reference to form and symmetry; but no one will hold for a moment that they are quite as good and apt in the one case as they are in the other. View them in the humblest light, as merely affording shelter from wind and rain, the blocks that are compactly and symmetrically arranged will answer that purpose infinitely better than those which are rudely thrown together. But, besides the elements of simple utility, we have an eye to be pleased, and a sense of beauty and form to be gratified. To withhold from these the legitimate objects of their desires, is to degrade man to the level of the brute, or at all events to prevent him from rising above the lowest state of savage existence. The acquirement of styles and modes of form is but the cultivation of intellectual tastes; and as these are elevated, so rise men in civilisation and refinement. The cultivation of refined tastes may not be virtue itself, but it is undoubtedly one of her most potent allies: beauty, rectitude, and chastity of mind, can expand nowhere so freely as when surrounded by beauty, and rectitude, and chastity of external forms. The acquirement of mere materials cannot therefore be the ultimate object of our pursuit; we ought only to rest satisfied when we have adjusted and arranged them in proper form; in other words, when we feel that, according to the popular phrase, we have done what we designed to do, in style. So also it is with matters of conduct. Men do not estimate actions solely by their intrinsic or abstract value; *manner* at all times constitutes a notable proportion of the estimate. Thus, though the ten pounds given willingly, frankly, and kindly in charity, is worth no more at the banker's than the ten pounds given grudgingly, sourly, and upbraidingly, yet in the wide world of humanity it is doubly and trebly valuable. Think you that the example of the man who acts handsomely and kindly is lost upon his fellow-men? Are we not creatures of imitation, prone not only to admire, but to follow a generous line of conduct? Even when some unworthy feeling creeps across the mind, how instantaneously is it dispelled by the sunshine of better example. It is thus that a Jackson's ten pounds may produce a hundred, stimulating the thoughtless to consideration, and shaming the niggard into liberality. But beyond this pecuniary view, there is a higher still. The object of our charity has thoughts and feelings keen as our own, and our respect for these is as imperative as our charity. We are commanded not only to bind the wound, but to drop the balm of consolation; not only to act justly, but to love mercy; and it is thus that the widow's mite becomes as valuable as the rich man's talent. So it is with all other doings—friendly, hospitable, charitable; with de-

meanour personal and with demeanour public: it is not enough that we say, and give, and do; if we wish to reap the respect of others, and enjoy satisfaction, we must be equally careful that these things be said, and given, and done in style.

Such an estimate and appreciation of style could not take place among any save a refined and civilised people, and to such a character—with all our faults—we may safely be allowed to lay claim. Were we less elevated, we would be less swayed by this idea; the 'doing of things in style' would never have become synonymous with excellence itself. But, independent of the high standard of value to which the phrase points, there is something exhilarating in its very tone. Let me only hear of a man who 'does things in style,' and I invariably ascribe to him a certain goodness of heart, affability of manner, and manliness of nature, which is quite delightful. I feel that everything connected with him must be first-rate of its kind; and I know, too, that if required to do an act of kindness or charity, that act would be done in a liberal and genial spirit. Nor is the doing of things in style confined to any rank or class: the man of £40 a-year may act within his own sphere equally well with him who has £4000. If he cannot afford Brussels carpet, he can at least keep his floor well polished and clean; if he cannot drink out of silver, he can at least have elegant delf; and though his coat be less costly, it may at least be clean, and neatly put on. It is taste, in fact, that regulates the whole matter; and that attribute of mind may be more exalted, purer, chaster, in a poor mechanic than in a pampered lordling.

HEALTH OF TOWNS IN LANCASHIRE.

THE Health of Towns' Commission has issued another of its reports on the sanitary condition of the large towns in Lancashire, consisting of a return laid by Dr Lyon Playfair before this useful board of inquiry. So much has now been accumulated and published on this subject by different bodies of commissioners, that it may appear needless to collect any more facts, or draw any new conclusions. Parliament, it may be said, ought now to be thoroughly indoctrinated with the necessity for legislating on the health of towns: and this is true; but the public at large are still very ignorant of what is required; a prejudice in favour of all sorts of abominations—burial within towns, and even within chapels, slaughter-houses in the midst of a dense population, disregard of ventilation and cleanliness—is almost universal; and we can only hope, by a more general enlightenment, to prepare the way for that species of legislation which is so very desirable. To aid this good cause, we offer a few gleanings from Dr Playfair's report.

The places which the doctor selects as illustrative of the general state of large towns in Lancashire, are Liverpool, Manchester, Preston, Bolton, Wigan, Ashton-under-Lyne, Bury, and Rochdale, all with a large population engaged chiefly in manufactures and trade. In these places, and some others, there is much defective drainage and sewerage, seriously affecting the public health. Yet not a little has lately been done in various towns to effect improvements in these respects. In Manchester, since 1830, more than thirty-two miles of sewers have been constructed, and some hundreds of small streets paved and rendered approachable. Whenever such improvements have been effected, the medical examiners 'express their astonishment at the better

appearance of the inhabitants and of the physical condition of these districts.' In Liverpool, the commissioners of sewers have expended above £100,000 in new sewers and paving during the last few years; but very much remains to be done. 'There are thousands of houses,' says a witness examined in Liverpool, 'and hundreds of courts in this town, without a single drain of any description; and I never had anything with greater delight than I do a violent tempest or a terrific thunder storm, accompanied by a heavy rain; for these are the only scavengers that thousands have had to cleanse away the impurities and filth in which they live, or rather exist.'

While most of the towns have very defective underground drainage, few if any can be said to be properly swept. It may be laid down as a principle, that every large town should be swept once a day; but few enjoy this advantage. Dr Playfair presents tables showing the comparative extent of scavenging in different towns in Lancashire and Scotland. Liverpool has 65 scavengers; its chief streets are swept once a-week; the cost of scavenging is £4820; the amount obtained per annum for refuse is £1150. Manchester has 78 scavengers; its streets are also swept weekly; the annual cost is £5600; the amount obtained per annum for refuse is £800. Edinburgh has 115 scavengers; its streets are swept every day; the annual cost is £12,000; the amount obtained for refuse is £10,000. Glasgow has 64 scavengers; the principal streets only are swept daily, the others less frequently; the annual cost is £2759; the amount obtained per annum for refuse is £1100. Aberdeen has 51 scavengers, and is swept daily. Saving off this branch of civic economy is far from wise. 'In the preservation of streets and roads, frequent scavenging proves a positive and direct economy of public money, and in the prevention of disease, an evident, though no less certain, saving of public burdens.'

Some very conclusive evidence is presented respecting the uncleanly habits of the poorer classes. 'Asses, hens, and pigs, are not unfrequently kept in dwellings, and I have seen them even in the sitting-rooms of the poor. Fever is induced by the filthy state of the interior of the house, and being communicated to other persons in the vicinity, becomes an extensive source of general disease and misery. One house is depopulated by fever, or the head of the family being cut off, the remainder remove: new tenants enter the infected house; they also become victims, make way for more, and thus fever becomes extended and perpetuated, because the authorities do not possess the powers contained in the Metropolitan and Liverpool acts—powers, however, not sufficiently summary—for cleansing the interiors of private houses.' We may add, that it is the opinion of Mr Ramsay, late of the Edinburgh police, that it would be a wise expenditure of public money to lime-wash every year all the houses under £4 rental which might require it; the number he estimates at three-fifths, and the utmost expense for the whole tenement would only be 7d.

By laying out a precautionary 7d. annually on every dwelling of the poor, thousands of lives would be saved, and consequently much public and private distress prevented. It is not believed that this cleansing process would be resisted by those to whose houses it was applied; the bulk of the humbler classes having no objection to be made objects of solicitude without cost to themselves. When nuisances, such as obstructions to drainage, or injurious manufactures, involve private interests, they cannot be so easily dealt with. The following may be cited as an example:—'Opposite the Manchester Royal Infirmary, and within the grounds attached to it, is situated a deep excavation, now filled with water. Formerly, erysipelas in an aggravated form, nearly allied to hospital gangrene, prevailed to a great extent amongst the patients in the infirmary. This excited the attention of the medical officers of that institution, who instituted an inquiry into the cause, and

after mature deliberation, recommended that the stagnant pond alluded to should be kept constantly filled with water, to be renewed at stated periods. Since the introduction of this plan, and that of dry rubbing the floors of the building, the erysipelas has much abated, but has not yet disappeared. The pond could easily be filled up, but in this case the lord of the manor, and another party, might claim the ground, and, by building on it, encroach on the proper space for the infirmary.' This, we think, is a pretty broad hint to those who suffer stagnant water near their dwellings.

The smoke nuisance is cited as another instance of the opposition of individual interest to public benefit; 'and here, it is to be remarked,' says Dr Playfair, 'that those who occasion the nuisance, do so in ignorance of the benefits to be derived to themselves from a consumption of smoke. It has been clearly demonstrated by every well-conducted experiment on smoke-burning, that there is a saving of fuel varying from 5 to 20 per cent., and in some cases even more.' Serious vitiation of the air, injurious to health, is caused by the smoke of large towns; the smoke nuisance also causes much needless expense to the inhabitants. 'The pecuniary annual loss to the community of Manchester for the excess of washing rendered necessary by its smoke, is above £60,000; for it has been found that a penny weekly per head of the population forms a very low estimate of the increased expense, when contrasted with the average expense of washing in towns free from smoke. By introducing into the calculation the excessive expense of renewed painting and whitewashing, it appears, by very low estimates, that the annual loss to Manchester by its smoke is double the amount of its poor rates.'

So much has been said of the dwellings in cellars and confined courts in Liverpool, that we need not here recur to the subject, but pass on to some observations on the motives for selecting such abodes. We are told that it would be an error to suppose that poverty was the sole cause of the selection. 'I know numerous instances of families,' says Dr Playfair, 'whose united wages amount to 40s. or 50s. a-week, yet possessing only one sleeping room.' Several cases of this kind are mentioned, but they cannot be extracted. The natural consequences of such overcrowding are great moral depravity, disease, and premature death. Dreadful as are the scenes observable in many private dwellings, they fall short of what are occurring in the lodging-houses for strangers, which all medical men concur in representing as the foci of malignant disease. The only remedy would be to place such houses under the cognisance of a medical police, with power to enforce sanitary regulations.

Strangely enough, bad ventilation is found in much higher establishments than lodging-houses for the poor and dissolute. The public schools of Lancashire are described as too frequently defective in this respect, the architects of such edifices having considered it quite sufficient to provide a certain number of doors and windows, without also furnishing atmospheric purity. Of 75 schools examined in Manchester, 35 were badly ventilated. When the pupils come from houses of a respectable order, the injury they sustain in school is not very observable; but those who live in cellars, or other badly ventilated dwellings, suffer prodigiously from the bad ventilation in their schools. In one school in Manchester, 70 per cent. of the infants living in cellars are always absent from sickness. In another, 27 per cent. of the cellar occupants are absent from sickness, while only 3½ per cent. of those who live in houses are absent from the same cause. In all the schools the average allowance of space to each child is about 5·9 cubic feet; 'and when it is considered that nearly double this amount of air passes through the lungs of a child, and is vitiated every hour, it cannot be considered surprising that the inmates of public schools, thus deprived of an adequate supply of fresh air, should suffer such a large amount of sickness, or that they should exhibit in

their outward appearance the signs of a weakly and puny childhood. It is quite amazing to observe the difference in the appearance of children attending a well-ventilated and well-regulated school, and of those who attend schools of an opposite description, especially such as are usually denominated cottage schools. The sanitary disadvantages under which children labour in most of our schools, are so much opposed to their mental progress, that nothing would be more conducive to the rapid advance of education than attention to structural arrangements.

With respect to the supply of water in the Lancashire towns, we have some useful observations. In Manchester, Liverpool, Bolton, and Wigan, the supply is intermittent; in Preston, Ashton, Oldham, Bury, and Rochdale it is continual. Intermittence of supply arises from a deficiency of water, and causes the parties receiving it to erect cisterns in their houses; the cost of a cistern and apparatus connected with it being from L.2 to L.4. When the supply is abundant, no cisterns are required; the water is continually on, and nothing more is wanting than a turn-cock on the pipe. In consequence of the expense of erecting and keeping cisterns in order, the charges of landlords on tenants in Liverpool for a stinted and intermittent supply of water are nearly double those charged for a constant and unlimited supply in Nottingham, Ashton, and some other towns. It ought to be a matter of first importance to give such an abundant supply of water to a town that no cisterns will be necessary, not only for the purpose of saving expense, but because water is more cool, pleasant, and healthful when taken from pipes than from any kind of in-door tank. We cordially agree with the following observations:—'There ought to be no limit put to the supply of water for domestic purposes, but on the contrary every facility should be afforded for its unsparring use. I have spent many days in visiting the houses of artisans in towns, both well and ill supplied with water, and I can state as an invariable rule, that there is a marked difference both in the moral tone and in the physical condition of the inhabitants of those towns; and this difference is even perceptible, though in a less degree, in the houses of the same town, according as they are or are not freely supplied with water.' It is mentioned, that in consequence of the water supplied to Manchester being somewhat hard, the inhabitants are put to an additional expense for soap; their loss in this way is estimated at L.49,363 annually, a sum nearly double the present gross water rental. So much for not procuring a perfectly soft water.

Dr Playfair presents a distressing body of facts illustrative of the havoc committed on infant life by the administration of opiates. But this subject we reserve for a separate paper.

We are furnished with some remarkable evidence on the general ratio of sickness and mortality in the county; the result given by a number of tables is, 'that there are every year in Lancashire 14,000 deaths and 398,000 cases of sickness which might be prevented; and that 11,000 of the deaths consist of adults engaged in productive labour. It further shows that every individual in Lancashire loses 19 years, or nearly one-half of the proper term of his life, and that every adult loses more than 10 years of life, and from premature old age and sickness, much more than that period of working ability. Without taking into consideration the diminution of the physical and mental energies of the survivors from sickness and other depressing causes; without estimating the loss from the substitution of young and inexperienced labour for that which is skilful and productive; without including the heavy burdens incident to the large amount of preventible widowhood and orphanage; without calculating the loss from the excess of births, resulting from the excess of deaths, or the cost of the maintenance of an infantile population, nearly one-half of which is swept off before it attains two years of age, and about 59 per cent. of which never become adult productive labourers; and with data in

every case much below the truth, I estimate the actual pecuniary burdens borne by the community in the support of removable disease and death in Lancashire alone at the annual sum of five millions of pounds sterling.

THE INDIAN FARM.

BY PERCY B. ST JOHN.

EDWARD WILSON was the son of a substantial farmer in the west of England, who had nurtured him with the greatest kindness, and set him out in the world under as advantageous circumstances as possible. Having afterwards failed in health and in wealth, the old man came to reside with his son, who then endeavoured to repay his paternal care by using every effort and making every sacrifice for the promotion of his comfort. Edward was a very small farmer, and his farm was upon an ungenial soil. But he was hardy and persevering to an uncommon degree, and early and late he strove to make amends for the natural difficulties under which he laboured. The desire of success in life, and a wish to smooth the few remaining years of his much revered parent, were powerful incentives to action; but perhaps the hope of one day seeing pretty Amy Walcot the inmate of his humble dwelling acted as a more powerful stimulus.

Amy was the daughter of one in exactly the same station of life as himself, but who, in equally moderate circumstances, and with much exertion keeping from debt and embarrassment, had the disadvantage of being so at a later period of life. Edward Wilson was young, with a fair prospect of many days before him; but Walcot was a more than middle-aged widower, with one only child Amy. The young people had known each other from early youth, and to know with them was to love; their affection, at first that of children, had grown with their growth and strengthened with their strength, until, taking the character of warm and earnest love, their union was delayed only until the clouds of doubt and difficulty should cease to dim their horizon. Like many others, Amy and Edward waited for better days. But the times, instead of mending, seemed to grow more adverse: the crops were one season unusually scant, and Edward for a time grew moody and sad.

Walcot's farm—of which he was a freeholder—was situated on the verge of the great highway to London, just opposite to where a green lane opened upon the dusty road. It was an evening towards the latter end of September; the toils of the hot day were over, and Amy and her father stood in the gentle warmth of the setting sun, looking out upon the scene before them. It was a still quiet English landscape; a road lined by green hedges, with here an opening and there a clump of trees, over which in the distance rose the spire of a humble village church, while all around at intervals wreathed columns of smoke denoted the presence of the scattered homesteads of the people. At length the sun set in a bank of blood-red vapour, just as a figure was sharply relieved against the sky in the act of crossing the unusually high stile that terminated the lane which led from Farmer Wilson's abode. Standing in the very centre of the dying glory of day, it looked like some fantastic creation of the brain.

It was Edward himself.

The young man was received, as usual, with a hearty welcome, and entered the quiet tenement where dwelt his betrothed, to spend the evening with the father and daughter. His own father retired to rest at twilight. Edward Wilson's visits were always matter of congratulation.

tulation. Walcot had an affection for him quite paternal, while Amy loved him with a truth and sincerity which she was at no pains to conceal. Upon the present occasion, however, their neighbour was moody and silent; some weight seemed to hang upon his spirit, while he was loath. it seemed, to get rid of the burden.

'Why, lad, what is the matter with thee?' at length said Walcot; 'thee's most uncommon silent to-night.'

'I have good cause for being so,' replied the more polished and better educated Edward, glancing with uneasiness at the wondering Amy.

'Why, lad, thee's got nothing new, I hope,' continued the elder farmer; 'times is dreadful bad already.'

'So bad, Farmer Walcot,' exclaimed Edward Wilson, 'that I have solemnly resolved upon selling off all I have, farm and all, and leaving old England for ever.'

A dead silence followed this announcement. Amy turned pale, and seemed ready to burst into tears: it was not the first time she had heard of it. Walcot looked astonished; but giving time for neither of them to speak, Wilson opened his views at length to his friends, informing them that the United States of America was the country he intended to be that of his adoption. He explained how land was to be had there in hundreds of acres, well wooded and watered, for a mere trifle; expounded every advantage which might or could accrue from the change; and, growing eloquent, painted the land of promise in all the colours in which emigrants view the spot they are about to select for a home. He spoke for more than an hour in warm and glowing language, neither Amy nor her father interrupting him save by an occasional question.

'Well!' said Walcot, when he at length paused, 'if thee's quite made up thy mind to go, Edward, why I and Amy must just do likewise, since I fancy that's what thee's driving at. Things is dreadful bad, and they can't be worse over yonder, and mayhap they'll be better.'

Amy's countenance brightened up; a temporary shade was effaced from that of Edward; and during the rest of the evening their future arrangements were discussed with zest and animation.

About eight months after the conversation between Walcot and Edward Wilson, a cavalcade entered one of the dense forests of the most northern part of Kentucky. It was composed of several wagons, and owned by a young man and his smiling wife, and two males of a more mature age. Four young farm-labourers with two of their wives from the old country accompanied the emigrants, while a kind of half-witted boy, who hung about the extreme border town, served as guide to the land of which the new settlers had become the owners by right of purchase. Edward and Amy were now man and wife, and they were entering upon the dangers and difficulties of their forest life with good hopes, but at the same time with a firm resolution to shrink from none which were at all surmountable.

The journey through the wilderness was trying in the extreme to man and beast. No road existed, and the wagons of the emigrants were dragged through the forest over fallen logs, through brush and brier, at the rate of from three to five miles a-day. Now a huge tree had to be removed from their path, then a dense mass of thicket had to be cut through, and next a deep hole would force them to make a long and fatiguing circuit. Two of the oxen died in the struggle, and the settlers had an early specimen of the difficulties to be overcome in a new country. At length, however, their five hundred acre lot was reached, and the whole was found to be covered with the same heavy growth of timber they had all along contended against.

Wilson, however, was not of a nature to be discouraged. Unyoking his oxen, the wagons were left upon the side of the sloping hill where the emigrant

had decided upon pitching his tent, not figuratively, but in reality, until a more substantial dwelling could be erected. This done, he returned to the frontier town, and hired two of those well-known workmen, who, with the American axe in hand, will lay low acres of forest in one-tenth the time that the European would take to do so. Their wages were high, but, as do all Yankees when once employed, they did their duty; and before the winter came on, a space of about eight acres was cleared, a house built, and the refuse of the timber, all but the solid logs, burnt to ashes. The space gained from the forest was small and unsightly—the trees which had been removed having been cut away two feet from the ground, and the stumps encumbering the fields—but it was still fields, and in due season they were filled with Indian corn, sweet potatoes, pumpkins, and all the usual agricultural produce of an American farm. Game, however, was the principal food of the settlers, who, despite the rudeness of their life and accommodation, were yet full of hope and energy.

The first discouraging symptom was manifest in the rainy season. The house was built half way down the slope of a hill, and nothing at first could be devised to keep it from being overflowed with water. A ditch, however, above the house, and trending away on each side, at length obviated this inconvenience. The spring came, and with it a trying time for the emigrants. The warmth of the weather, and the dense vegetation of the surrounding forest, brought sickness, and old Wilson died of the seasoning fever, while the young wife, who was about to make Edward a father, was within a hair-breadth of following the old man's example. One of the women lost her child; and to crown all, from inexperience in the practice of American agriculture, and from a sudden flood, their crops were utterly unproductive. The cattle, too, were sickly, and even some perished in consequence of the want of open pasture-ground.

From the anguish of mind and disappointment consequent on this series of calamities, Edward Wilson was awakened by the birth of a son. Still nothing seemed to prosper with him, and the second winter approached with little sign of amendment. The capital of both Edward and Walcot, the produce of the sale of their farms, was broken in upon more and more to supply the wants which disease and bad crops created. Neither of them, however, relaxed his efforts, and several additional acres were taken from the surrounding wilderness.

One evening, nearly two years after the first time when the several characters in this simple chronicle were introduced to our readers, the whole family were collected within the spacious log-hut, which, divided into several subdivisions, was the sleeping apartment of all. Wilson sat on one side of the huge and blazing fire, Walcot on the other, while Amy was near her husband, occupied in certain feminine offices respecting her babe, that slept in a wicker cradle at her feet. The labourers were fashioning rude handles for various farm implements, and the women were equally busy in sewing together the skins that with all served the purpose of outer garments. Edward was reading aloud from a newspaper, which had penetrated to this distant settlement, such scraps of news as were likely to prove interesting to his listeners.

While yet he read, a low knocking was heard at the door; the latch was then raised, and an unarmed Indian stood before them, panting for breath, and bleeding from many and fresh wounds. It was an aged Penobscot, but utterly unknown to all present.

'Indian wounded—saint—hungry—Sioux thirst for blood. Will white man give him meat and sleep?'

Wilson hesitated, Walcot half shook his head; but Amy at once settled any doubts which might have risen in the mind of her husband.

'Come to the fire, Indian,' said she kindly; 'and as soon as you have eaten, let us know what you have to

say of the Sioux. Methinks if they be in the woods, we must look to ourselves; and Amy gave a terrified glance at her sleeping babe.

'One, two, three,' said the Indian, gazing at the woman gratefully; 'ten, twenty bad Indian in woods. But squaw very good tell Indian welcome. Will white chief say so too?'

'Ay, that I will,' exclaimed Wilson warmly, his generous nature at once asserting its empire; 'eat, drink, and be glad, and then let us hear all that is needful to guard us against the enemy.'

'Guard first, eat after,' said the Penobscot with dignity. 'Sioux close at hand, chase Wan-ti-mo through woods all day. Wan-ti-mo kill two,' added he, exhibiting the usual trophies of victory, 'but can't kill twenty.'

The old chief then left the hut, returning next moment with his rifle, tomahawk, and powder-horn, which he shook mournfully, exhibiting its empty condition. No sooner was he once more within the walls of the hut than he told Wilson to bar the door, and make every other preparation for defence against the Sioux. Edward complied, and with speed all the arms they could muster were brought out and prepared for use, while one of the labourers, who was considered unusually sharp, ascended a ladder leading to a hole in the roof, and blocking himself against the chimney, watched all around that the Sioux approached not unawares.

Meanwhile Amy busied herself bathing and dressing the wounds of the Penobscot, who also ate eagerly and drank sparingly from a flask of brandy which was placed at his disposal; so sparingly indeed as to cause Edward to press it upon him.

'When sick,' replied the Indian, 'fire-water good, little so much,' pouring a small quantity into the palm of his hand; 'but much take away head—man no fight then—like hog.'

Amy smiled, temperance views being unfortunately little in vogue in those days, and Edward and Waloot, though moderate men, sometimes indulging so far as to be slightly elevated. They, too, smiled, but no longer attempted to press the liquor upon the Penobscot, who now intimated his intention of taking up the position occupied by the young labourer. Ascending the ladder, he glided beside him, and then sent him below.

The white men were now left alone; the house was prepared for defence; the doors and windows were carefully and securely barred; the lights, by the Indian's suggestion, extinguished; and the fire nearly smothered. Then certain loopholes, previously stopped up, were opened in several parts of the hut. This duty had scarcely been performed, when the Indian came stealthily down the ladder with a finger upon his lips. As soon as he was on the earthen floor of the hut he seized his rifle, and motioning to the others to do so likewise, pointed it through one of the loopholes, and as soon as the others were ready, fired. A loud wailing cry followed a fierce whoop, and then all was still.

'Indian,' said Amy fervently, while she pressed her babe to her breast, 'you have saved my child, my husband, my all; ask me for what you will that is mine, and you shall have it.'

'White squaw give Indian welcome—that enough,' replied the Penobscot proudly.

A conference was now held, after which Wan-ti-mo returned to his post above, accompanied by Edward. Peering cautiously around, the white man and the red skin strove both to penetrate the deep darkness of the night. Before them lay the forest, and between a field, the fair surface of which was much deformed by the presence of the black stumps above alluded to. Habit had made Edward aware both of the number and situation of these, and his eye at once detected the appearance of what seemed several additional ones.

'Hist!' said he to the Indian; 'in yonder field are fourteen blackened stumps where this morning these eyes saw but six. This is some device of the Sioux.'

'Good,' said the Penobscot, in a tone of deep satis-

faction. 'White man got sharp eyes'—and the two took simultaneous aim—'make good scout.'

The red skin and his companion fired both at the same time: a yell of rage and pain followed, and then there were but six of the unsightly objects which had before crowded so thick in the little field. From that moment all sign of the presence of an enemy disappeared, and the settlers reposed within their little castle, under the watch of the Penobscot, who, despite his wounds and fatigue, appeared yet the most active of the party. Day was just about to dawn when the Sioux again made their appearance, whooping and yelling like demons, upon the skirt of the wood. In numbers they were about forty, dividing which body into two, they boldly charged the hut. They were, however, met warmly, and repulsed; upon which they retired within the deep and sombre shelter of the forest, and all sank into a silence as deep as that which had prevailed before the white man laid bare a portion of its space to the light.

That the Indians had departed no one believed; and all therefore looked forward with horror to the protracted siege which it was evident they had determined on, and which, if conducted with any of the usual patience and energy exhibited by the savage, could not but terminate in his victory. No attack was made during the day, which passed to all wearily and slowly. Amy was sick at heart: the horrid fate which menaced her husband and child was ever before her eyes; while Wilson's more stern nature was also deeply moved. The Indian meanwhile laid him down and slept until the shades of evening again fell upon the scene, when he once more ascended the ladder, which enabled him to command a view of all around.

With the darkness came all these undefinable apprehensions which present themselves in such circumstances even to the strongest minds. For some time not a sound was heard, until one of the watchers at the loops announced the approach of the enemy. A straggling fire at once commenced, which lasted some time, the Penobscot's rifle being all the time silent. Edward was puzzled at the red skin's inaction, and leaving the rest to conduct the defence, ascended the ladder to question Wan-ti-mo. He was gone! This was a new source of fear and apprehension. Their assailants were proportionably stronger as they were weakened, though certainly the presence of a traitor was far from being desirable.

Edward descended with a heavy heart, and communicated his intelligence, which was heard by all with alarm, though Amy strongly asserted that, while they might have had a friend, she was sure they had not found an enemy. Edward replied not, but once more took up his post as commander of the little garrison. For hours the contest continued with small success on the part of the enemy, who, at length exasperated at the obstinacy of the defence, brought a new element to bear upon the besieged. The first intimation they received of this dreadful danger was the flight of a burning arrow which fell upon the dry and inflammable corn-houses and barns, and instantly wrapt them in flames. A loud yell proclaimed the delight of the savages—a groan the anguish of the owners of the habitation.

As soon as Edward recovered from the astonishment into which this terrible event threw him, he commanded the men to grasp their arms and prepare for a more deadly struggle than had yet taken place, as well as to neutralise the object of the Indians. At a short distance from the house was the pile of logs which served for fuel, three heaps, forming three sides of a square. To this the women and children went, and while two men kept watch lest the Indians should rush upon them, the others were occupied in removing their valuables from the house into the open air. The burning, meanwhile, extended in force, and presently cast so brilliant a light that the white men were forced within their rude breast-work. Dawn broke upon them in this position, and

then the Indians came whooping and yelling on, as if determined to take them by storm. Each man clutched his weapon, and as the foe neared them, rose and fired. The Indians paused, when the deadly discharge of twenty rifles in their rear, and the shadow of a dark line of men bursting over the fields headed by the Penobscot, sent them flying with their utmost speed over the expanse which lay between them and the forest, in whose recesses they concealed themselves.

Three hours after, Edward Wilson and his family stood gazing upon the ruins of his new home as it lay smouldering before him, in utter dejection of spirit. The allies from around whom the Penobscot had collected had plunged into the woods in chase of the Sioux. Silent and sad the emigrant leaned against the wood pile, his wife nursing her babe at his feet, and Walcott looking on sternly and gloomily. At this moment Wan-ti-mo and the white men returned, the latter at once offering to aid in the reconstruction of their neighbour's home. The Penobscot, however, now approached Edward while the others ate, and called him and his wife aside. Amy followed with her child in her arms. As soon as Wan-ti-mo had led them out of sight he turned to Edward.

'White man good to Indian—Indian got heart—heart feel,' said he; 'white man no think it, but Wan-ti-mo make him much happy. Follow Indian,' continued the Penobscot, pointing to the woods.

'No, Wan-ti-mo,' said Edward, 'I must look to the reconstruction of my home. I have not a moment to waste.'

The Indian was puzzled, though he would not own it; he was unable to express his intentions in English, still he urged Edward to follow him, but Wilson was inflexible. At length his eloquence being exhausted without avail, Wan-ti-mo turned towards Amy, and seizing the child with as much gentleness as possible, leaped away laughing to a distance from the astonished and alarmed parents. As soon as the Penobscot had gained a position about twenty yards from them, he halted, and holding up the child, motioned them to follow. This done, he turned round, and now Edward and his wife, treading forcibly in his footsteps, walked away through the forest at a slow pace. The path he followed was rude in the extreme, and one of the difficulties of which had always deterred those connected with the farm from attempting it.

In about half an hour Wan-ti-mo halted and allowed Edward and his wife to reach his side, while he pointed exultingly to an open space beyond. It was a lonely forest glade of some thousand acres, an interior prairie, which by some accident had never, though fertile in the extreme, been overrun by the dense growth which prevailed around. Edward at once understood the Indian's motive in bringing them to this spot, which was perhaps the very best locality for a settlement of any within twenty miles.

'White man's farm gone—Sioux dog burn up,' said Wan-ti-mo, placing the child in its mother's arms; 'that bad down there—too much tree—too much wet—too hard work; here tree plenty—land plenty—this Indian farm!'

Wilson clutched the hand of the Penobscot, and thanking him warmly, intimated his resolve to remove at once. They returned to their ruined home, and Edward signifying his intention, those who had so opportunely saved him from destruction now joined in aiding his plans for renovating his position. The removal was effected, but not without much arduous toil and difficulty. It proved, however, a happy and most fortunate change, and from that hour all prospered with the emigrants. They had fertile fields and grazing land in abundance, with wood in equal plenty. A congregation of log-houses arose. The capital of the settlers enabled them to improve their location, and to purchase it. A village ere long occupied the space round what had once been Wilson's solitary hut. The Penobscot became a hired hunter, and when age came upon him

was well cared for, Amy ever rejoicing, when she gazed upon her many prosperous and happy children, that she had protected the poor fugitive. She had saved him from his enemies, and all her subsequent happiness, and the success of those she loved, took its origin in the INDIAN'S GRATITUDE!

COUNTRY LIFE FOR LADIES.

It is a remark we believe of Joseph Lancaster's, that if you wish boys educated speedily and pleasantly, set boys to teach them. The same remark may with equal justice be applied to 'children of a larger growth.' If, for instance, you want ladies instructed in any science or accomplishment—whether it comes immediately within their own sphere of duty, or belongs rather to that of the other sex—by all means set a lady to teach them. Should the requirement come under the latter category, its masculine aspect will in a great measure be softened down by the treatment of a female mind; and should it come under the former, then who so well qualified both by feeling and habit to discharge a duty strictly feminine? The subject that might be treated by man in a severe, concise, and generalising spirit, would be managed by a woman's pen fluently and diffusely, and, with a regard to particulars, in a manner especially enticing to the fairer sex. Woman possesses a keener perception of the lovely and delicate, a nicer handling of minor topics, and discovers the inroads to her sisters' attention with a tact peculiarly her own. On such a theme as Country Life, where the management of the house, the garden, domestic animals, and the like are assigned to the ladies, no one could be more expert, or more likely to be successful than a lady instructor. She has studied and practised these duties as exclusively her own, and man, were he to attempt the task, would make but a very sorry preceptor in comparison.

Among the many treatises on rural subjects written expressly for ladies, those of Mrs Loudon take a high position, alike for the variety and accuracy of their matter. Her works on Botany, on Gardening, &c. are already well known, and we are gratified to find another recently addressed to the fair sisterhood, which is still more directly applicable to their country duties and avocations.* 'This work,' says the author, 'is intended principally for the use of ladies who have been brought up in a town, but who from circumstances have been induced to reside in the country. Persons so situated are generally at first delighted with the change; but they soon become full of complaints of the inconveniences of a country life, particularly of the difficulty they have in getting what they want, without sending to a great distance. This last inconvenience, however, is easily obviated by a little forethought and management; and dullness and monotony will only be felt by those who take no interest in country pursuits. Having lived in the country myself, I know both the inconveniences and the enjoyments of a country life; and in the following pages I have endeavoured to save my readers the pain of buying their own experience, by giving them the advantage of mine.' Such is the intention of the 'Lady's Country Companion;' and after a perusal of its pages, we are led to the conclusion that Mrs Loudon has left few subjects untouched which relate either to the duties or recreation of the lady of the manor. The work is composed of a series of letters, addressed to an acquaintance who has been recently married to a country gentleman of ancient family—the author assuring us 'that Annie is not an imaginary being, but a young lady I have known from her birth, and to whom I am sincerely attached.'

These letters embrace a wide field of duty; but before

* The Lady's Country Companion; or How to Enjoy a Country Life Rationally. By Mrs Loudon, author of 'Gardening for Ladies,' &c. London: Longman and Co. 1845.

entering upon minutiae, some salutary advice of a general nature is tendered. Thus, there is nothing more natural than that a person accustomed to the town should, on removing to the country, begin to experience a certain dulness and monotony; and, compared with the gaiety and bustle they have left, there is no doubt cause for the complaint. But if circumstances have cast one's lot in the country, it is obvious weakness in that individual—whether lady or gentleman—if he does not endeavour to find employment and amusement whereby not only to fill up his own time, but to make others happy around him. Thrown apart, to a certain extent, from society, we must look to ourselves and to surrounding objects for our pleasure; and on this point Mrs Loudon tenders her young friend some excellent advice:—'Happiness, I suspect, in most cases depends more upon ourselves than we are generally willing to allow; and I am quite sure that young married people who are attached to each other, and have a competency, may be happy if they will, particularly in the country, where their principal amusements must all centre in home. You will, perhaps, be surprised to find that I think this a cause of happiness, but you will find in time that I am right; and that our chances of being happy decrease in proportion as we depend upon others for our enjoyments. I cannot conceive a more miserable life than that of a beauty who has no pleasure but in being admired; and who, consequently, must pass her time in fits of alternate depression and excitement. It would give me the greatest pain to see you plunge into this species of mental intoxication, and I rejoice that you are placed in a situation where you will not be exposed to the temptations arising from bad example. In this respect your present abode seems to be everything I could wish; as, from the description you have given me of the difficulties attending visiting your neighbours, they seem to be enough to cure the most ardent lover of dissipation; and, unless the neighbours be more than commonly agreeable, I think you will not feel inclined,

—'Frequent visits to make
Through ten miles of mud for formality's sake,
With the coachman in drink and the moon in a fog,
And no thought in your head but a ditch or a bog.'

Do not suppose from this that I think you should be unsociable; on the contrary, I think it a duty to mix occasionally with the world, as, unless we do so, we should soon learn to set a false value upon ourselves and upon everything around us. The society of persons in our own rank in life is, therefore, essential to teach us our true level; and I have no doubt you will find some agreeable persons among your neighbours when you know them better, whose friendship you will think worth cultivating.'

Having thus counselled her friend, the author proceeds to the more practical duties of the House and Kitchen. These, as every one well knows, are numerous and varied, and here they are spoken of sensibly, and just as one lady should discourse of them to another. Fires, ventilation, furniture, harmony of colours, ornaments, and so on, are separately discussed as belonging to the house: the making of wines and liqueurs, baking and cooking, with their numerous recipes, rank under the kitchen. We are at all times averse to trench on the prerogative of the ladies, and therefore dismiss this section with an expression of our belief, that Mrs Loudon's instructions, if followed, will produce not only an elegant and comfortable house, but a substantial and delicious dinner table. The Larder and Dairy are also very cleverly treated; and what little heterodoxy may appear under the latter head, is not to be wondered at. The author is not infallible more than any other person; and many of higher pretensions than she, are on this matter still widely at variance. After all, it signifies very little; for during the whole of our acquaintance with the country, we have never found a couple of ladies agreed on the subject of the dairy, nor did we ever know one who did not think her own method the best.

Passing from these topics, the author takes up the Garden, the Greenhouse, the Park and Lawn; and here, as the widow of one of the first botanists and landscape gardeners of the age, she is perfectly at home. This is undoubtedly the most delightful, as it is the most instructive, section of the book; it is not a mere dry calendar of operations, but an essay full of good taste and sound judgment. Any lady who will attend to these directions—and they are given in plain and familiar language—may, in a few years, establish one of the finest gardens; and may also, now that the glass duties are abolished, rear the most delicate exotics at very little cost.

On the subject of the pleasure-grounds, Mrs Loudon's remarks strike us as in admirable taste; and as country ladies must spend so much of their time in and around their mansions, we cannot see how this department should not be almost exclusively intrusted to their care. 'An ancient mansion,' says she, 'embosomed in tall trees, with a fine broad terrace at the back, having a piece of still water lying like a liquid mirror below it, and a large park beyond overgrown with majestic trees, whose lower branches repose upon the turf beneath them, form a scene which sounds exceedingly well in description, but is very wearying to the eye which is destined continually to rest upon it. It is also not very healthy, as chilly vapours are sure to rise from the water, while the mass of trees beyond will obstruct the free current of air. You must not suppose from this that I admire a house in an open exposed situation, as I think nothing can have a more bleak and naked appearance. Besides, a house entirely unsheltered by trees is sure to be a very uncomfortable residence, from its exposure to the heat in summer and the cold in winter. It is, therefore, most desirable to have a sufficient quantity of trees near the house to shelter it, and yet to have numerous openings through those trees to admit distant prospects, and a free current of air. If a few openings could therefore be made in the plantations near your dwelling, I do not think there would be any danger in leaving the water in its present position; as, from your description, the house is elevated very much above it, and as, notwithstanding its appearance of stillness, there is a current through it. As to your house being on the ridge of a hill, I do not think that is any objection, as the rise is not very great on either side, and it is a proof that the prospect would be good if you would only cut down a sufficient number of trees to show it. Houses quite in a valley are frequently damp, and if on the summit of a high hill they are apt to be bleak; so that the side of a hill, or the ridge of a knoll, is in fact the best situation that can be imagined. Our ancestors, indeed, rarely went wrong on this subject; and it is quite an extraordinary case to find an old house badly placed. In the old times the country gentry lived in their mansions all the year, and only visited London occasionally, so that they were more anxious to make their homes comfortable than persons of the same rank at the present day, who live in London and only visit the seats of their ancestors as they would a watering-place.'

Again, in combating the young lady's objections to the 'monotony of foliage,' Mrs Loudon explains how the surrounding woods must have vistas and glades cut in them so as to open up distant prospects; and also shows that the sameness arises from the want of variety among the trees already planted. Woodland scenery can never be monotonous where there are different kinds of trees; for every genus has its own colours, and shapes, and styles of growth, presenting to the eye, when well arranged, a beauty and complication which is truly enchanting. Observe how charmingly this topic is handled. 'Forest scenery is extremely beautiful in itself, and principally from the great variety it presents in the same objects. A fine tree, even when bare of leaves in winter, is beautiful from the delicate tracery presented by its branches, which look like the masts and rigging of a large ship, intricate, yet without confusion. In

snow, trees assume a new character; the weight sustained by the branches makes them droop, and a thousand graceful and elegant forms take the place of what was before a stern and rigid outline. In hoarfrost, trees glisten with a thousand gems, reflecting the rays of light in so many different colours, that they remind one of the description of Aladdin's magic garden. In spring they present vivid ideas of youth and fertility, and all nature appears awaking into new and vigorous life: the buds swell, their coverings burst, and the young leaves display their tender and delicate green; at first only half-unfolding their beautiful forms, and reminding one of a young and timid girl half-wishing and half-fearing to make her first appearance in the busy world. Trees now begin to assume each a new and decided character of its own. The leaves of no two trees are alike: those of the beech are of clear dark green, and so thin that they are almost transparent, and yet they are deeply marked with a strongly indented feather-like set of veins. The bark of the beech is clear and smooth, as though nature had intended it for the use to which it has so often been applied by lovers—to carve on it a fair one's name. The leaves of the elm are of a thick coarse texture, rugged and distorted, wrinkled, and of a dingy green; and the bark of the tree is cut into a thousand furrows. The leaves of the ash are light and pendulous, and cut into numerous leaflets; those of the oak are deeply indented, and generally grow in tufts. The palmate drooping leaves of the horse-chestnut contrast with the long, slender, and nearly erect leaves of the white willow; and those of the black poplar, which present a smooth outline, with those of the sweet chestnut, which are remarkable for their finely indented edges. In short, the leaves of every tree have beauties peculiar to themselves, in form as well as in colour. In autumn these colours become more decided: the lime trees take a yellowish tint, and the oak a reddish brown; the liquidambar becomes of a rich purplish crimson, and the maples and American oaks show a thousand varied dyes. Yes, my dear Annie, I repeat, the fault is not in the trees, for they are beautiful; you dislike them only because they are so crowded that you cannot see their beauties.

The consideration of the Domestic Animals next engages attention, and under this section ponies, cows, pigs, poultry, and bees are treated in a style that will gladden the heart of the most ardent housewife. Nor is it all utilitarianism, for deer, pheasants, partridges, and other wild animals which are the ornaments of woods and pleasure-grounds, come in for an ample share of the country ladies' attention. The natural history of Rural Walks is also descanted upon, and the lady shown how every object around her may become one of interest and instruction. But, it may be asked after a perusal of all this immensity of cares and duties, is the country life of ladies to be one only of toil and business? By no means; for, although it might be shown that there is enough of recreation, ay and amusement too, combined with the above avocations, yet Mrs Loudon has a keener appreciation of her sisters' wants than deny them the enjoyment of lighter amusements. Archery, sketching in the open air, swinging, pleasure-boats, skating, sporting, &c. are the subjects of a special chapter; recreations to which we only wish that our towns' beauties had readier and more frequent access.

Much as there may be in all that precedes to occupy the attention of a lady's country life, still is there something of paramount importance to follow. We live not only for ourselves but for those around us, and it is a poor and miserable spirit—all the more miserable that it has the means—which does not systematically endeavour to contribute to the welfare of others. This is particularly the case with the wife of a landed proprietor, whom circumstances place both as the patroness of, and the model to, the surrounding peasantry. On this topic Mrs Loudon's exhortations are given in good taste, and in a feeling and benevolent spirit:—'I have now, my dear Annie, a few words to say on a more im-

portant subject than those I have yet touched upon; I mean the duties which are imposed upon you by your residence in the country. As your husband is the last descendant of an ancient family, it is particularly incumbent upon him, and of course also upon you, to keep up as much as possible the kindly feeling which existed in the olden time between the lords of the soil and its cultivators, but which has, of late years, been too much neglected. The proprietor of a large estate ought to be regarded by the labouring cottagers in the light of a protector, to whom they can look up for advice and assistance in their troubles; and as a friend upon whose kindness they may confidently rely, and who they know will be interested in their welfare. When this is the case, the tenantry of a country gentleman will form his best body-guard; and, instead of ever attempting to injure his property, they will do all in their power to protect it.

'I think it highly desirable that you should be personally acquainted with the poor people in the vicinity of your husband's mansion, that you may know how to afford them the most acceptable assistance, and who are most deserving of it. For this reason I think you should occasionally walk through the village, instead of confining your rambles exclusively to the park, and call frequently on your poorer neighbours; not with the apparent wish of dictating to them how they should live and how they should manage their families, but with the ostensible appearance of employing them in some little work, and in reality to see how you can best be serviceable to them, and how you can do them the most positive good. It is the blessed privilege of wealth and rank that they give us the power of making our fellow-creatures happy, with very trifling inconvenience to ourselves. A word or a kind look from the rich to the poor speaks volumes, and carries with it encouragement and pleasure, which no efforts of persons in their own rank in life can give. It is, however, difficult for the rich to know how to be of real service to the poor, as giving alms seldom does good except in cases of sudden and unforeseen distress. The best charity is first to teach the poor how to maintain themselves, and next to give them employment; and when they have this, they have a better chance of happiness than any riches could bestow combined with idleness. Perhaps, indeed, there is no state of existence more happy than that of a person who is usefully and profitably employed, and whose employment is of such a nature as to exercise moderately the faculties both of the body and the mind.

'Establishing schools is an important duty which the rich owe to the poor. Every girl ought to be able to sew neatly and well, and to read, write, and keep accounts. I think also it would be a great advantage if all the girls who have attained the age of fourteen were to receive a few lessons in dress-making, and making waistcoats and boys' clothes, from the regular mantua-maker and tailor of the village; or you might pay for this out of your own pocket, and make it a reward for good conduct. It is particularly useful to the wife of a labouring man to know how to cut out and make or alter clothes, as work of this kind can be taken up and laid down while the mother is nursing her children, or watching the boiling of a pot, or some similar kind of simple cookery.'

Mrs Loudon also advises teaching the daughters of the peasantry the best modes of cooking suitable to their rank in life—a subject at present very much neglected, and which, to the poor, is of great importance both dietetically and economically. She again diverges into the matter of employment, exhorting her young friend to teach the doctrines of self-reliance, and to help in furnishing the poor with something to do for their own permanent support, rather than to aid by mere temporary donations. 'In cases of illness,' she continues, 'I am sure you will be happy to assist your poor neighbours in every way in your power. When poor people are ill, their means of support are stopped,

and they have not only to labour through the pains of illness, but they are also exposed to the greatest privations for the want of food at the very moment when food of a more nourishing nature than usual is required for them. Then it is that the helping hand of the rich is of the greatest value to the poor, and that charity takes its most graceful form.

'Many ladies in the country employ a portion of their time in making clothes for the poor; but with the exception of permitting young people to make baby-linen, I question whether it is advisable that much should be done in this way. The feelings of the poor are often hurt by having it dictated to them, what they are to wear, and they are apt to look upon the clothes thus given to them, and which are probably quite different from what they would have purchased for themselves, almost as a badge of slavery which they are compelled to wear to please their patrons, but of which they hate the very sight.'

Such is an outline of the 'Lady's Country Companion,' which, upon the whole, is the best of its kind we have perused. The matter is exactly of the nature required for a young lady passing from a town to a country life. Of faults, we can only find inclination to denote those of diffuseness and occasional carelessness of expression. While the former may be a merit, as some subjects, like certain liquors, are rendered more palatable by a little dilution, we are altogether at a loss to invent an excuse for the latter in an author of Mrs Loudon's standing.

MRS STONE'S CHRONICLES OF FASHION.*

THIS book seems entitled to a respectable place among the lounging productions of the day. It assembles from all sources, accessible and otherwise, and strings up in a pleasant style, traits and anecdotes illustrative of the 'Cynthia of the minute,' in eating, dressing, and amusements, during the last two centuries. It is essentially a chronicle of that small body of people who, since Elizabeth's time, have been accustomed to assemble in London for a portion of the year, and there live in each others' eyes a life of vanity and vacuity, seeking in mere frivolous amusement, and in the cultivation of fine external appearances, that excitement which affluent circumstances deny their finding in any of the common pursuits of the world. We cannot say that this is a subject much concerning any rational person, or of any absolute dignity or importance: were we inclined to speak strongly, we might say something to the contrary purpose, besides remarking on the indecencies which some of its chapters necessarily involve. But the real object is only to amuse, and we take the book as we find it.

A chapter on Banquets and Food, with which the work opens, runs rapidly along from the coarse revels of James I.'s court to the luxurious but still inelegant entertainments of the second Charles, and thence to more refined table affairs of the eighteenth century, introducing tea and coffee by the way. One reference to a peculiarly idealised kind of banquet, given by the Duke of Buckingham about 1626, we cannot overlook. 'Ballets, accompanied by beautiful music, were performed between the courses; and indeed the arrangements seem to have been so managed, that the very matter-of-fact services of moving and replacing dishes were poetised by being done by attendants in fancy dresses, made to assimilate in appearance, and possibly in some degree to tally in action, with the subject and scene of the ballet. After dinner, they proceeded to the hall by a kind of turning door, which, admitting only one at a time, prevented all confusion, and another ballet was exhibited. To this succeeded dancing, and

afterwards a supper of "five different collations" was served in beautiful vaulted apartments.' It may interest the reader to know the origin of the word toast, as implying the object of a health drinking. 'It happened that on a public day [at Bath in the reign of Charles II.] a celebrated beauty of those times was in the cross-bath, and one of the crowd of her admirers took a glass of the water in which the fair one stood and drank her health to the company. There was in the place a gay fellow, half duddled, who offered to jump in, and swore, though he liked not the liquor, he would have the toast. He was opposed in his resolution; yet this whim gave foundation to the present honour which is done to the lady we mention in our liquors, who has ever since been called a toast.

The next chapter, on Manners, gives a distressing view of the coarseness and essential vulgarity which have marked the 'fashionable' class in this country almost to our own time. Next follow chapters on Habitations and Carriages. Amusements, as might be expected, fill a large space, including theatricals, balls, masquerades, Vauxhall and Ranelagh, &c. The impression everywhere conveyed is, that an improvement, both in morality and in taste, has taken place since the days of our fathers. It will surprise many who think that our ancestors surpassed us at least in religion, to know that almost to the close of the last century the court received company, and fashionable people in London had card parties, on Sunday. Even Queen Anne, that stanch friend of the church, 'was in the habit of having prayers read in an outer room while she dressed in an inner one. On one occasion the door was ordered to be shut whilst the queen changed some linen, and the chaplain ceased to read; on Anne expressing surprise at this, he had spirit enough to say that "he would not whistle the word of God through a key-hole." It appears from the Spectator, that fashionables always saluted each other, and often interchanged words and snuff-boxes, in church.

'Almack's' took its rise at the close of the Seven Years' war, in consequence of the reduced state in which many of the upper classes were left by that contest, and to keep off the citizen class, who at the same time had been making rapid advances. Being no longer able to maintain their peculiar ground by expensive entertainments, they were obliged to resort to the expedient of a rigid exclusivism. At that time, and down till the close of the century, the minuet was a favourite dance—a slow and stately exhibition of a single pair in the midst of a circle of onlookers. 'At Bath,' we are told, 'each gentleman was expected to dance two minuets, and on the conclusion of the first, the master of the ceremonies led the lady to her seat, and conducted another fair one to the expecting gentleman, who stood awaiting her in *statu quo*, with his opera hat and his "dancing feet" in the most perfect position which the skill of his dancing-master or his own good taste enabled him to assume. Rather a nervous situation this, one should think; certainly quite enough to make a young man not thoroughly seasoned to the exhibition feel "rather all-overish." The young ladies of that day, too, must have had considerable nerves to brave the slow ordeal of a minuet with the eyes of a whole assembly of scrutinising dowagers, jealous-eyed young ladies, and quizzical men fixed upon them. But if to dance a minuet well required a degree of self-possession not always found in very young persons, it also entailed inevitably the cultivation of some degree of grace and dignity in manner and in movement—circumstances which, as every one knows, are by no means indispensable to the performance of the modern quadrille, or to the mazurka, or to the gallopade, or to the polka. No, it must surely be in the performance of the stately and graceful minuet—a descendant of the *pavan* of the knights and dames of chivalrous times—it must certainly be in the performance of the minuet that a woman dancing may claim the epithet which has been bestowed upon her—"a brandished torch of beauty."

* *Chronicles of Fashion*; from the time of Elizabeth to the early part of the nineteenth century, in *Manners, Amusements, Banquets, Costume, &c.* By Mrs Stone, authoress of 'The Art of Needlework,' &c. 2 vols 8vo. London: Bentley. 1845.

In the time of the minuet, a circle was the form which company always took in a drawing-room when not employed at cards or in dances where many couples were engaged. This was a dull and chilling mode, and seems to have been felt as an intolerable tyranny by at least the gentlemen. The custom was first broken through by a Mrs Vesey, than whom none was better qualified to venture on such a revolution, as she is said to have been 'the charm of every society.' The means adopted consisted in simply throwing the chairs into little dispersed groups throughout the room. 'Mrs Vesey's parties have been thus described:—"Mrs Vesey had the almost magic art of putting all her company at their ease without the least appearance of design. Here was no formal circle to petrify an unfortunate stranger on his entrance—no rules of conversation to observe—no holding forth of one to his own distress and the stupefying of his audience—no reading of his works by the author. The company naturally broke into little groups, perpetually varying and changing; they talked or were silent, sat or walked about, just as they pleased. Nor was it absolutely necessary even to talk sense. Here was no bar to harmless mirth and gaiety; and while perhaps Dr Johnson in one corner held forth on the moral duties, in another two or three young people might be talking of the fashions and the opera, and in a third Lord Orford (then Mr Horace Walpole) might be amusing a little group around him with his lively wit and intelligent conversation. In these parties were to be met with occasionally most of the persons of note and eminence, in different ways, who were in London either for the whole or part of the winter. Bishops and wits, noblemen and authors, politicians and scholars—

* Chiefs out of war, and statesmen out of place —

all met there without ceremony, and mixed in easy conversation."

We would here venture to remark, for the benefit of persons of mediocre rank who occasionally see company, that much more lies in the arrangement of the mere upholstery than they may be dreaming of. Two rows of sofas and chairs proceeding from the respective sides of a fireplace form too often the leading arrangement, the consequence of which is, that the company sits down in two still formal lines, where no one can speak to any but his next neighbours. And as changes in such a situation draw attention, it generally happens that each person is condemned to the society of two others only, for the whole evening. The ease becomes worse when, as is often seen, the ladies are preferred to the seats on the sofas by themselves; for then they exchange not one word with a person of the opposite sex for the whole evening. Let our friends of the middle classes adopt and act upon Mrs Vesey's ideas about furniture, and they will find their parties increase amazingly in popularity.

Stars of fashion, eminent beaux, and fashionable watering-places, fill up a few chapters agreeably, and finally we come to an elaborate section on costume. Here a few passages may be selected almost at random, as the whole is amusing. After an account of *etui-cases*, our authors thus proceeds:—

"It was in vain that Mr Isaac Bickerstaff intimates that he compelled or persuaded his sister, Mrs Jenny, to 'resign her snuff-box for ever,' on her marriage;* for all men and women, high and low, young and old, were inveterate snuff-takers during the last century; and indeed this dirty habit has only lately subsided, being upheld in the highest fashion by the practice and example of Queen Charlotte, and her son King George IV. At one time the same necessity which led to the adoption of strong perfumes might justify the use of snuff, otherwise fashion itself would hardly seem to account for its very general and excessive consumption. Of course the form and garniture of the snuff-box itself

became a point of importance to the critically-dressed leader of ton, and on nothing has a greater profusion of taste, fancy, expense, and skill been lavished, than on the snuff-box. They became an article of virtù, critically assorted by collectors, and a choice and *recherché* offering of compliment in every possible way, as much so as the Spanish embroidered gloves of Elizabeth's day. The freedom of cities was given in a snuff-box, the donations of the charitable were handed in a snuff-box, the portrait of majesty was bestowed on a snuff-box, and the right hand of fellowship was extended with a snuff-box. A snuff-box, erstwhile, has been a fatal gift.

'The fair one who was proof against a jewelled necklace could not resist a diamond snuff-box; nor could a patriot resist the conviction which flashed before his eyes on opening for nasal refreshment the "slight token of regard" which bore his royal master's portrait enamelled and jewelled on the lid.

'Edward Wortley Montagu, the eccentric son of Lady Mary, is said to have possessed more snuff-boxes than would suffice a Chinese idol with a hundred noses—a collection which perhaps was never equalled unless by that of King George IV., who was not less extravagant and *recherché* in snuff and snuff-boxes than in other things.

'Frederick the Great of Prussia had a magnificent collection of snuff-boxes; he carried one of enormous size, and took it not by pinches but by handfuls. It was difficult to approach him without sneezing; and it was said that the perquisites that came to the *valets-de-chambre* from the snuff they got from drying his handkerchiefs were considerable.

'Beau Brummell had a remarkable collection of snuff-boxes. He and his royal patron were both remarkable for a peculiar and graceful manner of opening the snuff-box with one hand only—the left. Probably in these latter days, when perfect repose and quietude are the essence of good breeding, any display with the snuff-box farther than a very slight "illustration" of the jewelled finger in raising the lid of the box might be considered as *trop prononcé* for elegance; but such was not the idea of our great-great-grandmothers and grandfathers. They seem to have displayed it most actively and elaborately, if we may judge from a satirical advertisement which appeared in the *Spectator*.

"The exercise of the snuff-box, according to the most fashionable airs and motions, in opposition to the exercise of the fan, will be taught with the best plain or perfumed snuff at Charles Lillie's, perfumer, at the corner of Beaufort Buildings, in the Strand; and attendance given for the benefit of the young merchants about the Exchange for two hours every day at noon, except Saturdays, at a toyshop near Garraway's coffee-house. There will be likewise taught the ceremony of the snuff-box, or rules for offering snuff to a stranger, a friend, or a mistress, according to the degrees of familiarity or distance; with an explanation of the careless, the scornful, the politic, and the surly pinch, and the gestures proper to each of them.

"N.B.—The undertaker does not question but in a short time to have formed a body of regular snuff-boxes ready to meet and make head against all the regiment of fans which have been lately disciplined, and are now in moti^{on}."

'A marvellous and spirit-stirring sight our grandmothers must have presented, with the fans which are represented as doing so much execution, and which were of a size to do execution, being often not less than a yard wide. The *Spectator* informs us, that "women are armed with fans as men with swords;" and we almost think it must have been so too, from the accounts we read of the various exercises and evolutions they performed with them, and the execution dire that was sometimes perpetrated by their means. The most effective exercise of the fan, as well as the most difficult to learn, for, according to the *Spectator*, its acquisition

took three months, was the flutter of the fan—as this flutter was capable of expressing any emotion which might agitate the bosom of the fair holder at the moment. There was “the angry flutter, the modest flutter, the timorous flutter, the confused flutter, the merry flutter, and the amorous flutter.” Nay, the Spectator declares that he could tell by merely seeing the fan of a disciplined landlady, whether she were laughing, frowning, or blushing at the moment. It was in truth “a wondrous engine,” and well might the careful guardian

“his lonely charge remind
Lest they forgetful leave their fans behind;
Lay not, ye fair, the pretty toy aside,
A toy at once displayed for use and pride,
A wondrous engine, that by magic charms
Cools your own breast, and every other's warms.
What daring bard shall e'er attempt to tell
The powers that in this little weapon dwell?
What verse can e'er explain its various parts,
Its numerous uses, motions, charms, and arts;
Its painted folds, that oft extended wide,
The afflicted fair one's blubbered beauties hide,
When secret sorrows her sad bosom fill,
If Strephon is unkind, or Shock is ill:
Its sticks, on which her eyes dejected pore,
And pointing fingers number o'er and o'er,
When the kind virgin burns with secret shame,
Dies to content, yet fears to own her flame;
Its shake triumphant, its victorious clap,
Its angry flutter, and its wanton tap!”

Very different were the fans of this day from the wavering group of feathers, with its jewelled handle, which Queen Elizabeth and her fair attendants fluttered. The Duchess of Portsmouth, King Charles's French mistress, wore a fan not unlike those of later times in shape. Madame de Maintenon had a most interesting one, on which her own apartment was represented to the life. The king appeared employed at his desk, Madame de Maintenon spinning, the Duchess of Burgundy at play, Mademoiselle d'Aubigny, niece to Madame de Maintenon, at her collation. Those of the Spectator's day were large, substantial, elaborate affairs, and, like some fashionable claptrops of the present time, quite “pictorial.” At the time of Sacheverell's trial, nothing was seen on the fans of the high-church ladies but “pictorial” representations of Westminster Hall at the time of trial, with the meek and interesting “victim” at the bar. When Gulliver's Travels appeared, all the fans at the church and the opera testified the delight of the fashionable world in that production. One was sent as a present from a great person here to Lady Bolingbroke, with all the principal scenes from that celebrated work painted on both sides of the fan. When the Beggars' Opera was the rage, all the favourite songs in it were painted on the ladies' fans.

Political emblems were so rife in those belligerent days, that a lady's opinions were known as well by her fan as by her patches. Fashionable women never appeared without their fans. They would as soon, perhaps sooner, have gone without their gowns. From the time of their rising in the morning to that of their retiring at night, at church or at market, in the crowded assembly or the solitary sick-room—everywhere, suspended from her wrist, the fashionable woman carried her fan.

It need hardly be said that fan-making was, in the last century, an extensive and important business, and called into requisition the talents of the highest painters and the first-rate mechanicians. If they yielded in grace and elegance to those of Elizabeth's day, they did not in richness and magnificence. The handles were often splendidly mounted in diamonds, and inlaid with jewels; the fans exquisitely painted by first-rate artists. Many celebrated artists of fifty years since began life as fan painters. Miss Burney mentions several beautiful fans which she saw at Sir Joshua Reynolds's, painted on leather by Poggi, from designs of West, Reynolds, Cipriani, and others, which she says “were more delightful than can well be imagined.” One was

bespoken by the Duchess of Devonshire, as a gift to be sent abroad. This is by no means a solitary instance of fans of English manufacture being sent abroad as presents, yet it often appears that the Parisian ones were preferred in England. Walpole frequently writes to friends abroad, and when on the continent himself, is usually commissioned to procure fans for his friends. The Duchess of York, soon after her arrival in this country, displayed a splendid fan, “entirely of diamonds, with an ivory mounting, the sticks pierced and set with brilliants in a mosaic pattern; but the outside ones were set with a single row of diamonds, while very large brilliants fastened the fan at the bottom.”

The fan, though dwindled immeasurably from the magnificence of its predecessors, dwarfed in size, and

Fallen, fallen, fallen, fallen,
Fallen from its high estate

as an accredited instrument of coquetry—the fan, “all that remained of it,” as Curran said of himself when obliged to plead without his wig—the fan, such as it was, was used, not elaborately, not conspicuously, not *avec prétension* as in the good old times—but still sleepily and languidly it was used even in this century. For many years it has been extinct, but appears now to be reviving. Some very beautiful ones have of late been exhibited by our caterers in virtue, and they are beginning to peep between the folds of satin and of the intricacies of lace in some of our aristocratic shops. What may this portend? Should the fan revive, may we hope that a new Spectator will arise phoenix-like to teach us its exercise!

There is, we believe, no part of the human person which has been so much the sport of fashion as the head. On this subject we have a few pleasant gossipries:—“It now only remains,” says Mrs Stone, “to notice that twin abomination of the last century,

“The pride of the topping, delight of all eyes!
That tite which attempted to rival the skies;
Whence Cupid, the god, and destroyer of hearts,
With rancour dancing the keenest of darts,
Sat smiling in ambush.”

The tête indeed was a fitting accompaniment to the hoop; in fact, the one required the other. At the time when the hoop attained its greatest magnitude, a head the natural size would have appeared inconsistent, too minute for the enormous figure; and, *vice versa*, when headdresses, with their superstructures of feathers, flowers, gauze, &c. not to mention the still more absurd ornaments of bunches of vegetables, became so large that women of fashion were compelled to ride with their heads out of their carriage-windows, or kneel down in the carriage to accommodate them within, why, then, the most expanding hoop seemed to be only in fit proportion to the astonishing head.

We have mentioned in our first volume, that in the time of Charles II. the falling and graceful ringlets of the “beauties” were exchanged for stiff frizzled tiers of curls, which, becoming still stiffer, more elaborate, and more artificial, were at length manufactured into the tower or commode of 1687. Why the term commode has been applied to all sorts of inconveniences, we cannot imagine; but nothing could be more appropriate than the word *tower* to the style of headdress which it represents. By the aid of true and false hair, of cushions and rolls, and other supporting scaffolds, crowned by gauze and ribbons, a piece of architecture was achieved, which was piled—to speak classically—like a Pelion on Ossa on the heads of the fair fashionables of the times of Mary and Anne. This made fine hair a very valuable and saleable commodity. Malcolm gives an anecdote of a young country girl coming to London, and selling her hair for fifty pounds, thereby realising the fortune which her lover's flinty-hearted father required, ere he would consent to their marriage. At a later period, the celebrated Mrs Howard (Lady Suffolk) sold her own beautiful hair in order to enable

her husband (then in very narrow circumstances) to give a dinner of policy to a great man.

The Duchess of Marlborough was noted for her beautiful hair, which, fortunately, she was not compelled to sell; though the circumstance of her cutting it off to spite the husband, who was affectionate and gallant enough greatly to admire it, is well known. Her daughter, Lady Sunderland, had equally beautiful hair, and was equally well aware of the circumstance; but, instead of parting with it in a fit of ill-temper, she tenderly cherished it, and was most peculiarly assiduous in combing, curling, and decorating it in the presence of those gentlemen whose political influence she wished to gain, and who were always courteously welcomed at her toilet.

The Spectator says, "Sempronia is at present the most professed admirer of the French nation, but is so modest as to admit her visitants no farther than her toilet. It is a very odd sight that beautiful creature makes, when she is talking politics with her tresses flowing about her shoulders, and examining that face in the glass which does such execution upon all the male standers by. How prettily does she divide her discourse between her woman and her visitants! What sprightly transitions does she make from an opera or a sermon to an ivory comb or a pincushion! How have I been pleased to see her interrupted in an account of her travels by a message to her footman! and holding her tongue in the midst of a moral reflection, by applying the tip of it to a patch!"

To return to the towers. Queen Anne's good taste led her after a while to discontinue them, and to resume a more simple and natural coiffure. The Spectator thus alludes to the change:—"There is not so variable a thing in nature as a lady's headdress; within my own memory I have known it rise and fall within thirty degrees. About ten years ago it shot up to a very great height, insomuch that the female part of our species were much taller than the men. The women were of such an enormous stature, that *we appeared as grasshoppers before them*. At present the whole sex is in a manner dwarfed, and shrunk into a race of beauties that seem almost another species. I remember several ladies who were once very near seven feet high, that at present want some inches of five. How they came to be thus curtailed I cannot learn; whether the whole sex be at present under any penance which we know nothing of, or whether they have cast their headdresses in order to surprise us with something in that kind which shall be entirely new; or whether some of the tallest of the sex, being too cunning for the rest, have contrived this method to make themselves appear sizeable, is still a secret; though I find most are of opinion, they are at present like trees new lopped and pruned, that will certainly sprout up and flourish with greater heads than before. For my own part, as I do not love to be insulted by women who are taller than myself, I admire the sex much more in their present humiliation, which has reduced them to their natural dimensions, than when they had extended their persons and lengthened themselves out into formidable and gigantic figures. I am not for adding to the beautiful edifices of nature, nor for raising any whimsical superstructure upon her plans: I must therefore repeat it, that I am highly pleased with the coiffure now in fashion, and think it shows the good sense which at present very much reigns among the valuable part of the sex. One may observe that women in all ages have taken more pains than men to adorn the outside of their heads; and indeed I very much admire that those female architects, who raise such wonderful structures out of ribbons, lace, and wire, have not been recorded for their respective inventions. It is certain there have been as many orders in these kinds of building as in those which have been made of marble: sometimes they rise in the shape of a pyramid, sometimes like a tower, and sometimes like a steeples."

The gentlemen's wigs had all this time been enormous.

Queen Anne was quite a patroness of full-bottomed wigs; and when the "Ramilieatie" came into fashion, by which the long waving curl, or to speak more accurately, the monstrous tail or fleece was gathered together by a ribbon behind, and one of her officers appeared at court in it, she said to a lady in waiting, "I suppose that presently gentlemen will come to court in their jack-boots."

The large wigs were enormously expensive, costing as much, some of them, as forty guineas each. Of course they were as much in request amongst light-fingered gentry as a gentleman's watch; and incredible as it may appear, gentlemen were almost as easily deprived of them. We read in the Weekly Journal for March 30, 1717, that the thieves have got such a villainous way now of robbing gentlemen, that they cut holes through the backs of hackney-coaches, and take away their wigs, or the fine headdresses of gentlemen. So a gentleman was served last Sunday in Tooley Street, and another but last Tuesday in Fenchurch Street; wherefore this may serve for a caution to gentlemen or gentlemen that ride single in the night-time, to sit on the fore-seat, which will prevent that way of robbing. A most ingenious mode was for a thief to carry on his head a sharp boy in a covered basket, who, in passing through a crowd, would dexterously seize and conceal the most attractive-looking periwig.

The 'Chronicles of Fashion' are embellished with many portraits, and the book is altogether a handsome, as it is a decidedly entertaining one.

POPULAR LIBRARIES.

THE formation of libraries in parishes and other limited districts, which began in our country about sixty years ago, is now in the course of being extended over the whole empire. Libraries are also planted in hospitals, workhouses, and jails; in factories, war-vessels, and regiments. Indeed there is now hardly a group of persons of the humbler class which is not provided, or about to be so, with regular means of intellectual nourishment. Private persons, too, of no exalted rank or affluence, are enabled, in this age of cheap literature, to grace their homes with a goodly range of favourite authors, and thus add in a most important way to their rational enjoyments. While such is the case, we become sensible from applications repeatedly made to us that there is a great lack of right information with regard to the proper materials of popular libraries, both as respects the character of the books and what may be called the *bibliography* of the question; that is to say, the proper editions, and the prices at which they are to be purchased. It has occurred to us that in such circumstances we may, without incurring any charge of officiousness, come forward with an ideal catalogue of books suitable for the masses.

In doing so, we have of course as individuals been thrown much upon our own judgment. And our choice of books, like that of every other individual, being more or less peculiar, it follows that the present catalogue may not be, in all its particulars, what any one of those who peruse it would approve. Let it, however, be taken as a selection made to the best of our judgment and taste, and which we consider as liable to all kinds of modifications according to the peculiar views of those to whom it is offered. Many faults of both omission and commission will be found in it: a few interlineations will remedy the one, and a few dashes the other. We must at the same time state that, in forming the list, we have been guided to a considerable extent, both by hints from persons in the management of libraries, and by considerations as to the prices of books. Many classic works we omit, because they are found to be little called for in popular libraries; many others appear not here, simply because no moderately priced editions of them exist. The list, indeed, has been designed rather to comprehend the best of the cheap editions of contemporary publishers—the books fabricated expressly for the

masses—than a perfect summary of the choicest productions of British intellect. It is only necessary further to remark, that the whole class of religious books is unavoidably left to the special judgment of our various readers, as, seeing that we address all sects throughout the United Kingdom, any selection we had made would have been useless, excepting for a more or less limited party.

[The books marked with an asterisk are considered as the most eligible. The initials express the names of the publishers—thus: Bal. Baldwin; Bent. Bentley; Bl. Blackwood and Sons; Bu. James Burns; C. and H. Chapman and Hall; Cad. Cadell; Ch. W. and R. Chambers; Cl. Clark; Col. Colburn; For. Fordey, Newcastle; H. and D. Harvey and Darton; Kn. Knight; L. Longman and Co.; Mox. Moxon; M. Murray; O. and B. Oliver and Boyd; Par. Parker; R. T. S. Religious Tract Society; S. and M. Simpkin and Marshall; Sm. Smith; T. Tegg; Wh. Whitaker and Co. The prices stated are for the most part the full nominal prices of the books, in boards or sewed, liable to a discount for ready money varying from five to ten per cent. In a few cases, a dagger is affixed, indicating that the price has been broken, and that the book is, by special care, to be had at a considerably lower rate.]

HISTORY AND BIOGRAPHY.

Barrow's Life of Sir Francis Drake. 1 vol. 2s. 6d. M.—Bastile and its Principal Captives, by R. A. Davenport. 1 vol. 5s. T.—Bell's Life of Mary Queen of Scots. 1 vol. 3s. 6d. Wh.—Carrick's Life of Sir William Wallace. 1 vol. 3s. Wh.—Cortez and Pizarro. 2 books, each 3s. Bal.—D'Aubigne's History of the Reformation. 3 vols. 10s. 6d. ADEN.

Aden is a station on the Arabian side of the Red Sea, established only a few years ago for the accommodation of steamers passing to and from Suez and Bombay. The following concise account of it was lately given at a meeting of the Asiatic Society, by assistant-surgeon Malcolmson, who had been a permanent resident there ever since the place was taken possession of by the British Indian government:—Mr Malcolmson states that the town is built in the centre of an extinct submarine volcano, whose activity must have surpassed any idea we can form in judging from the operations of existing volcanoes: that after a season of repose, which may have lasted myriads of years, it became active again, and formed a second crater on the north-western side of the valley. He places the second eruption at a period long anterior to the existence of animal life. With the exception of one peak, the whole of the peninsula is composed of rocks unfit for building purposes, as they peel off in thin laminae when exposed to the air. The peak excepted is a basalt, projecting from the edge of the precipice, down the sides of which the masses required for building are thrown by the blast which detaches them into the valley below, where they are shaped for use. The writer is of opinion that Aden was once an island; and that the isthmus now connecting it with the continent, which is nowhere above six feet in height, or three quarters of a mile in breadth, was formed by the tides from each side meeting in the middle.

The animals of Aden are a few timid monkeys—believed by the Arabs to be the people of the tribe of Ad, transformed in consequence of their wickedness—some hyenas, many very beautiful foxes, and an immense number of rats. The reptiles are snakes, lizards, and scorpions of two kinds—one very large, reaching to eight inches in length, but whose sting is not dangerous; the other smaller, said to be very venomous. The plants are chiefly pretty flowers, growing in the hills; and there were some acacias of considerable size, and other trees, at the coming of the English; but these have been all cut down for fuel. The climate may be divided into two seasons, the hot and cold: in the hot season, the thermometer ranges as high as 104 degrees in the shade; but the heat is by no means unbearable; in fact, the difference between the sensible temperature and that shown by the thermometer is always

very remarkable. This great heat does not produce sickness: and although the troops suffered dreadfully at first, from want of accommodation and proper food, from the great fatigue and watching to which they were exposed, and from the dreadful filth of the place, now that these causes are removed, the writer feels warranted in stating, that a more healthy station does not exist in any British colony.

When the place was first occupied by the British, the population consisted of about 1000 half-naked and half-starved inhabitants: there are now at least 20,000 residents, well clothed and well fed; besides the troops, amounting to 3500, and a fluctuating population of 1500 souls. The water is very superior, and obtained from wells, in which it remains at the same level at all seasons. It is not, unfortunately, sufficiently attainable for irrigation, and there is but little rain to supply its place: were it not for this impediment, the success of the government garden proves that the soil would be highly productive. There are remains of large tanks on the peninsula, which the writer thinks were abandoned when the wells were dug; but in all probability they were used for irrigation, and, if restored, might be again available for that purpose. The dwellings are principally composed of wooden uprights, whose intervals are filled with reeds, and lined with matting formed of leaves of the date tree: they are cool and comfortable; and better adapted to the climate than more costly edifices. The chief objection to them is, their liability to fire; of which an instance was seen in the whole of the lines of the 10th regiment having been destroyed in two hours. The place is now healthy; the troops and their families cheerful and happy: they have good quarters and excellent food, and are on good terms with the inhabitants. The town is improving; ruins have almost disappeared; many stone-houses have been built, and others are building; the streets are now well levelled and regular; and the revenue has doubled every year. Mr Malcolmson is decidedly of opinion that Aden is destined to be one of the most important posts belonging to England; as there is every indication that the intercourse with India will be restored, at least in part, to its ancient route.

MONUMENTAL RECORDS OF THE DEAD.

In our public monuments, persistent interest has been too much forgotten. Beauty and grandeur of form have been sought for; useful beauty has been neglected. Man-kind have reared a statue, with sometimes elaborate decorations and accompaniments, at an immense cost; but beyond a chef-d'œuvre of art, little has been achieved; the enduring form appeals to the age, and the influence stops. The highest range of art is to combine the useful with the beautiful, to render the memorial subservient to the purposes of public good, and thus continue through all time, not alone the name and figure of the now unbreathing great man, but continue as it were the nobler part of him—his mind, his heart, with all its man-loving aspirations; thus enabling posterity not only to read his name and see his similitude, but to feel his influences in the good they at the same moment enjoy, and thus, 'he being dead, yet speaketh.' One of the noblest monuments in this country records the name of a humble, strong-minded man, Thomas Hobson, carrier, of Cambridge. It is on a plain stone building, which supports four spouts of a conduit, which conveys a stream of the most brilliant water, brought at the expenso of Mr Hobson from the Chalk hills, near Cambridge, into the town. A young lady, a governess, some time ago died at or near Ockley, in Surrey, the poor inhabitants of which were but ill supplied with wholesome water. This lady left some four or five hundred pounds to be expended in digging a well and constructing a pump; and beneath a very appropriate and elegant rustic covering stands the pump, on which is inscribed—

'The benevolent bequest of Jane Scott, MDCCLXXXVII.'

The pump, constructed for the good of poor people, who must be content often to get but good water, by means of the intelligent kindness of the beneficent lady, Jane Scott, will cause her name to be read by many a passer-by with eye-glistening emotion. This Jane Scott must have been a good woman. The carrier and the governess have struck a new and most truly poetic style of monumental trophies. It is to be hoped the idea suggested by these examples may be followed out generally. Ockley is a beautiful village at the foot of Leith Hill, on one road to Worthing from London. The houses are stretched along an immense

quadrangle, which forms a common, a delicious open green—everybody's park—and may it long be kept sacred from the enclosing edge. In the middle of this stands Jane Scott's pump. She also left funds for a school. There is an elegant school-house which bears her name.—*Historical Register.*

RISE IN THE WORLD.

You should bear constantly in mind that nine-tenths of us are, from the very nature and necessities of the world, born to gain our livelihood by the sweat of the brow. What reason have we then to presume that our children are not to do the same? If they be, as now and then one will be, endowed with extraordinary powers of mind, those powers may have an opportunity of developing themselves; and if they never have that opportunity, the harm is not very great to us or to them. Nor does it hence follow that the descendants of labourers are *always* to be labourers. The path upwards is steep and long to be sure. Industry, care, skill, excellence, in the present parent, lay the foundation of a *rise*, under more favourable circumstances, for the children. The children of these take *another rise*; and by and by the descendants of the present labourer become gentlemen. This is the natural progress. It is by attempting to reach the top at a *single leap* that so much misery is produced in the world; and the propensity to make such attempt has been cherished and encouraged by the strange projects that we have witnessed of late years for making the labourers *virtuous* and *happy* by giving them what is called *education*. The education which I speak of consists in bringing children up to labour with *steadiness*, with *care*, and with *skill*; to show them how to do as many useful things as possible; to teach them to do them all in the best manner; to set them an example in industry, sobriety, cleanliness, and neatness; to make all these *habits* to them, so that they *never* shall be liable to fall into the contrary; to let them always see a good living proceeding from labour, and thus to remove from them the temptation to get at the goods of others by violent or fraudulent means, and to keep far from their minds all the inducements to hypocrisy and deceit.—*William Cobbett.*

SPEECH-MAKING.

Who has not known a pleasant party utterly done for—every element of its pleasantness extinguished by the demon of speech-making throwing its wet blanket over it. The interesting conversation, the smartly-maintained argument, the quick repartee, the good-humoured badinage—all paralysed in a moment by some unhappy speech-maker, who rises from his chair, like a ghost through a trap-door, and in an unflattering stolid voice asks permission to propose a toast. It is granted of course. You know that all is over—the blow has been struck—enjoyment is lying sprawling under the table, dying or dead. You may as well take your hat and go home disconsolately in the rain: you know what will follow. You know that the wretch is going to propose your host's health—you know all that a creature of the kind says—he is always sure the toast he is about to give requires no comment—that its object requires no eulogium from him to make them all do that toast due honour. They all know their friend—their excellent, their valued friend—and that, as surely as he is known, he is esteemed—that they all can and do appreciate those many excellent qualities which have so generally endeared him, either as a husband, a father, or a friend. Knowing this, and feeling this, he did believe himself called upon to, &c. &c. &c. All the commonplace cant of compliment is duly gone through; and the mischief is, that the matter don't end here. The toastee (there is no law against coining words as against coining half-crowns) is in duty bound to return thanks, which process he performs by disclaiming *seriatim* all the flattery lavished upon him, and too often winding up by plastering it more upon another, who in his turn repeats the interesting operation. And so it goes round: the mania is as catching as the small-pox. Everybody proposes everybody else's health. It would be an insult given to leave out anybody—received, to be left out by everybody. Conversation, amusing or instructive, gives place to a rapid round of compliments, neither instructive, nor amusing, nor sincere. You no more mean what you say when you make an ordinary buttering after-dinner speech, than you do what you write when you finish a letter with 'your most obedient servant,' and address it to a fellow whom you mean to kick the first time you can catch him.—*New Monthly Magazine.*

CHILDREN.

[From 'The Child of the Islands,' by the Hon. Mrs. Norton, newly published.]

Yes, deem her mad! for holy is the way
Of that mysterious sense which bids us bend
Toward the young souls now clothed in helpless clay—
Fragile beginnings of a mighty end—
Angels unwinged—which human care must tend
THE ~~young~~ ~~world's~~ ~~weak~~ ~~path~~ ~~alone~~,
Serve for themselves, or in themselves offend.
But God of ~~earth~~ ~~heaven~~ ~~will~~ ~~from~~ ~~his~~ ~~high~~ ~~throne~~,
And sees, with eyes benign, their weakness—and our own!

Therefore we pray for them, when sunset brings
Rest to the joyous heart and shining head;
When flowers are closed, and birds fold up their wings,
And watchful mothers pass each cradle-bed
With hushed soft steps, and earnest eyes that shod
Tears far more glad than smiling! Yes, all day
We bless them: while, by ruleless pleasure led,
Their voices echo in their gleesome play,
And their white careless souls are making holiday.
And if, by Heaven's inscrutable decree,
Death calls, and human skill is vain to save;
If the bright child that plumed to our knee,
Cold and inactive, fills the silent grave;
Then with what wild lament we mean and rave!
What passionate tears fall down in ~~unconscious~~ ~~showers~~!
There lies Perfection!—there, of all life gave—
The bud that would have proved the sweetest flower
That ever woke to bloom within an earthly hour!

For in this hope our intellects abide
All reason—~~all~~ ~~experience~~—~~mind~~ ~~forgot~~
Belief in that which only is secure,
Our natural chance and share of human wo.
The father pitieth David's heart-struck blow,
But for himself, such angry defies:
No future Absalom ~~his~~ ~~love~~ ~~can~~ ~~know~~;
No pride, no passion, no rebellion flies
In the unspilled depth of those delightful eyes!

Their innocent faces open like a book;
Full of sweet, prophetic of coming good;
And we who pore thereon with loving look,
Hend what we most desire, not what we should;
Even that which suits our own ~~ambition's~~ ~~need~~.
The scholar sees distinction prompted there—
The soldier, laurels in the field of blood—
The merchant, venturous skill and trading fair—
None read of broken hope—of future—of despair!

Nor ever can a parent's gaze behold
Defect of nature, as a stranger doth;
For these (with judgment true, severe, and cold)
Mark the ungainly step of heavy cloth—
Coarseness of features—tempers ~~ever~~ ~~wroth~~;
But those, with dazzled hearts such errors spy,
(A halo of indulgence ord'ring both):
The playmate child a stranger pauses by,
Shows a love to the sight of some enamoured eye!

The mother looketh from her latticed pane—
Her children's voices echoing sweet and clear:
With merry leap and bound her side they gain,
Offering their wild field-flow'rs: all are dear,
Yet still she listens with an absent ear:
For, while the strong and lovely round her press,
A halt uneven step sounds drawing near!
And all she leaves, that crippled child to bless,
Folding him to her heart with cherishing care.

Yes, where the soul denies illumined grace
The last, the worst, the fatallest defect,
Still, gazing earnest in that ~~lost~~ ~~face~~,
Thinks she perceives a dawn of intellect:
And, year by year, continues to expect
What time shall never bring, ere life be flown:
Still loving, hoping—patient, though defect,
Watching those eyes that answer not her own—
Near him—and yet how far! with him—but still alone!

Went of attraction ~~this~~ ~~love~~ ~~cannot~~ ~~mar~~;
Years of rebellion cannot blot it out:
The prodigal, returning from afar,
Still finds a welcome, given with song and shout!
The father's hand, without reproach or doubt,
Clasps his—who caused them all such bitter fears:
The mother's arms encircle him about:
That long dark course of alienated years,
Marked only by a burst of reconciling tears!

CHAMBERS' EDINBURGH JOURNAL

METAPHYSICS OF BUSINESS.

We hear much of various circumstances affecting business in this busy country, but few ever dream of its being liable to one influence, greater perhaps than all the rest put together—the workings of human nature.

A curious fact has been remarked, that the funds—all ordinary affecting circumstances being fully allowed for—always incline to be somewhat higher in spring than in autumn. There cannot, we think, be a doubt that this is owing to the various conditions of men's minds in the two seasons. In the opening of the year, there is an excitement of the hopeful and cheerful sentiments, under which we are more disposed to speculation and adventure. The decline of the year, on the contrary, raises melancholy and timorous sentiments; we then feel inclined to draw into our shells and wait for brighter days: speculation has no charms for us. In the one case we are under the influence of hope; in the other, of cautiousness. It would almost indeed appear as if we were, in this respect, subject to laws similar to those which affect birds and other lower animals, causing them to exhibit no active industry except in spring. It is only when we have a future bright before us, that our energies are fully roused.

The same feelings are seen exercising a most potent control over the state of markets, and in all adventurous kinds of business. These things are notably oscillatory; and this is simply because hope and cautiousness take command over us in an alternating manner. The natural procedure of the two feelings is this: for a time after an experience of evil or a threat of danger, cautiousness is predominant. Gradually, after a cessation of these experiences, we forget them. Cautiousness is lulled; hope and confidence again awaken; and these go on in increasing activity, till danger and evil once more supervene, and then they give way in a moment to revived cautiousness. Thus it is that, for some years after such a 'crash' as that of 1825, joint-stock speculations are held in universal dread; so that even a really promising one would be shunned. But by and by the sufferings and losses are forgotten. Men begin to touch and taste, and finding no immediate harm, they at length take whole mouthfuls. Hope gets into full commission, *viz* cautiousness retired, and then we see the most visionary schemes eagerly embraced, where recently the most plausible and prudent would have been repudiated. A 'crash,' with its distressing consequences in the ruin of individuals, and embarrassment of general business, finally lays hope once more so completely prostrate, that for years men cannot be induced to venture even on the fairest chances. The rise or fall of prices in all affairs admitting of the least speculation, is governed by the same principle. A little rise from just causes excites hope, under whose

influence a further and unwarranted rise takes place. While the progress in this direction remains unchecked by any external cause, all is sanguine expectation in the mercantile mind. No one seems to have the least conception of a possible reverse. Everybody wishes to buy from everybody. Reason has nothing to do with it: it is a mere sentiment which is at work. But let the slightest prognostic of a *turn* come into view, and in an instant the hopeful feeling sinks like a punctured wind-bag. A panic supervenes, and things never rest till they are as much below the fair and reasonable point as they were formerly above it.

Have we not here, also, nearly the whole philosophy of what are called 'gluts' and 'bad times'? Manufacturers go on for a while producing a particular article with the greatest diligence, as if they believed that mankind were in danger of some tremendous inconvenience for want of it. This enthusiasm in (we shall say) trouser stuffs finds at length a slight check. In an instant the manufacture ceases, the works are stopped, the workmen are thrown idle. For months there seems to reign over the district a dreary conviction that mankind are never to require trousers any more. Now it was neither true at first that mankind were in any pressing need of nether-garments, nor that they have now abjured all further use of them. They use such integuments in a regular monotonous manner, and will evermore do so. The irregularity is in the mental impulses of the producers of trousers. These men happen to regard their wares with alternative paroxysms of hope and despair. The consequence is that at one time a factory is put to top speed, and the workmen are tempted by high wages to exceed the proper hours of labour, in order to produce a good deal more cloth than the public has immediate use for, while at another the whole system is laid utterly idle, because men somehow feel a heavy market as an indication that the world is at an end. Hence arise most important results in our social economy. A Leeds, a Manchester, a Sheffield, is every now and then a famine city, because business affairs are regulated, not by the sense and judgment of mankind, but by mere sentiments not necessarily connected with reflection. How absurd to suppose business men to be prosaic and over-sober of mind! They are the greatest sentimentalists that breathe.

We must now consider another portion of our subject.

Accustomed as we are in this country to see almost every person engaged in some kind of business or craft, we are apt to suppose it the natural and ordinary state of things. A twelve hours' bill seems the general fate of man. But in reality constant working is the exception from the rule. There are very few nations which pursue regular callings continually. Some that are by no means uncivilised work extremely little.

The Turks, for example, are an indolent people. Powerless, handless, they spend the whole day in perfect vacuity, apparently never giving themselves the least concern about the means of subsistence. And yet, somehow, the Turks live. All the people along the south of Europe are comparatively inert. The *Dolce Far Niente* is the prevalent taste of the Mediterranean nations. The striking distinction of the Englishman in this respect seems to be in a certain anxiety about the welfare of himself and his family. He starts in life with an awful sense of the necessity of getting on in the world. He will, with the greatest coolness, commence a business which he knows will require his being a daily and nightly slave for thirty years, undreaming that he is making any extraordinary sacrifice. He sees ages of bill-troubles before him, but looks upon it all as a matter of relentless destiny. Even when the first claims of his sense of duty have been fulfilled, and he knows he is safe from poverty for life, he works on for the love of working, rather than walk into a system of idleness which would present to him no enjoyable advantages. Now, who ever heard, in the literature or history of any nations away from central Europe and the United States of America, of such a thought predominating among them as the necessity of getting on in the world? They are not, in general, altogether idle. They till, and weave, and fabricate in a way which seems to be sufficient for their wants; but they are totally unacquainted with that system of close and incessant moulting after increase of goods, which appears to be the first law of existence amongst us. It must also be remembered that we know of the world having existed for centuries upon centuries, before it exhibited *anywhere* an example of this passionate attachment to workshop, counter, and desk. There was no shopkeeping worth speaking of in ancient Greece or Rome. Factories existed not among the Ptolemies. While the crusades swept across Europe, there were few men calling themselves merchants in London, Paris, or Venice. It is entirely since the close of the middle ages that men have raised into vogue the idea that business is the sheet-anchor of individuals and of nations. There is thus a great difference from past time to present, as well as from other nations to us. This shows fully, we think, that business is not a thing necessary or unavoidable to our human nature. It can be no special result of certain faculties which have no other purpose or mode of action. Yet this is what we might suppose, if we were to see nothing in business but the gratification of the working or fabricating faculty, and of the love of gain. It therefore appears that the love of action and of excitement, or what Dr Darwin would have called 'an accumulation of sensorial power,' is what chiefly animates the hard-working nations, being the same impulse which once gratified men in war and in the chase, and still leads the born wealthy to the turf and the gaming-club. It is but the phase in which the mass of manly power and endowment appears in modern civilised nations. And accordingly trade has its heroes and conquerors as well as history. We shall find on many an 'exchange' combinations and calculations profounder than any that ever emerged in St James's or Versailles; and it would not be difficult for any one acquainted with such towns as Glasgow or Liverpool to point out men between whom and a Napoleon it is not easy to see any distinguishing qualities besides their superior worth.

The view which we are disposed to take respecting the benevolence of business accords with this idea as to their main ends being, after all, but the gratification of certain mental faculties. To appearance there is nothing but selfishness regarded in business, and if the pursuit of his own end by each individual conduces, as

Adam Smith endeavours to show, to the general weal, it is no praise to the motives of particular parties. But the worship of fortune in reality involves no necessary subjection of the heart to selfishness. The fact is, that where business exists on a considerable scale, its votaries act under two opposite and apparently irreconcilable principles: in purely business matters, they are keen and inflexible, ever disposed to exact the whole of their rights; in domestic and social matters, they may be at the same time bountiful and conceding to a surprising degree. Meet them upon a bargain, and you would think them stern, and wrapped up in views of their own interest. See them next day in private, and you discover that they use their wealth with a generosity that shows they are far from loving it for its own sake. We have here a consideration which seems to take much from the force of those writings which hold up the present as an age of Mammon-worship. The following of Mammon is a fact in itself; but it ought to be taken in connexion with other circumstances, by which its effects are much modified. Our ruling competitive principle unquestionably calls out emulation and worse passions; but these are softened by the humanity and largeness of soul which are conspicuous features of the mercantile mind in all above the struggling classes. We are not, let it be fully understood, inclined to believe that the present plan is the best conceivable for the subsistence of nations. We thoroughly believe that, in time, such great bodies of people will feel and act more as only a large kind of families, and enjoy almost, if not altogether, in common the fruits of the general industry, finding that thereby they realise greater enjoyments than are to be obtained by each standing upon his individual acquisitiveness. All this may be unhesitatingly admitted, and yet we will say that the present system is far less selfish than is generally supposed, seeing that selfishness is the rule only in a certain routine of transactions so monotonous as almost to be a complete abstraction, while the kindly social affections in reality prevail over, and give character to the ordinary demonstrations of the individual.

We have here merely broken ground in a subject which appears to us to possess great interest. We willingly leave to others to investigate it more deeply, and place the matter in all the various lights in which it may be contemplated. Meanwhile, some of these speculations may be brought home to men's bosoms. It is very obvious that the interests of a vast body of people—of that class generally who live by labour—are involved to a serious extent in the briskness and dullness of business. It is of importance for them to be aware that, so long as the competitive mode endures, the amount of their incomes, and even the question whether they shall have an income at all or not, depend upon the extent to which the faculty of hope is active in the brains of the employing class. So long as employers are sanguine as to markets and results of mercantile combinations, the horde of the industrious are safe; let the tide turn—and its ebb is as sure as its flow—and a large proportion of this huge multitude must cease to be employed. The fact of hundreds of thousands of our people being thus withheld at any time from a penury verging upon and often trenching upon pauperism, only by the afflatus of an accidental sentiment in the minds of another portion of the community, is one of those great problems of modern times at which the wisest are the most apt to stand aghast. It is surely by no means creditable to our national sagacity, that we should contentedly see times of prosperity thus go on to the inevitable break-down, when thousands upon thousands are sure to be thrown into misery, and yet believe it all to be in the fair and proper course of things. No provision by the industrious themselves for the day of certain evil; no arrangement by the sage and politic for softening the blow when it comes; no lesson for the future taken from the past; and, above all, no whispered alarm into any mind as to the soundness of the social

plans which involve such tremendous calamities. Verily, we are yet children acting upon our first instincts, and the manhood of man—the time of reason and true brotherly kindness—seems yet far off.

HISTORY OF A NEGRO PLOT.

MANKIND always fear those whom they oppress, and desirous of finding an excuse for their oppression, they are never slack in accusing the injured of a disposition to conspire and revolt. History abounds in instances of this species of injustice. Every country in Europe has had its *plots*, not one in a hundred of which rested on any other foundation than the real or pretended fears of the oppressing party. So also have all slave-holding countries their plots—mere figments of the imagination, but which are nevertheless made the plausible ground for renewed restrictions on the unhappy objects of oppression.

We propose to shame human nature with an account of one of these fabulous plots, and the cruelties of which it was made the pretence.

Slavery was a legal institution in the North American colonies previous to their declaration of independence; no one either at home or abroad thinking there was anything wrong in dealing in negroes as articles of merchandise, or in subjecting them to perpetual bondage. From the government in Britain the colonial governors had strict injunctions to cultivate the African trade, as it was called, and to take care that the negroes who were imported should be properly watched, lest they should commit the odious and ungrateful crime of seeking to emancipate themselves by violence. It was not necessary to give any such injunctions, for the colonists were so much alive to the necessity for checking an inclination to revolt, that, like all oppressors, they were continually imagining outbreaks, and taking the sharpest measures to prevent their occurrence. In the year 1741, a panic cry of negro revolt was raised in New York, which threw the inhabitants of that city into a state of great excitement and alarm; the rumour being that the negro population designed to burn the town and massacre every white inhabitant. This insane idea originated in the following circumstances.

A Spanish vessel had been brought into port as a prize, and a number of its sailors being men of colour, they were not treated as prisoners of war, but condemned as slaves in the court of admiralty, and accordingly sold to the highest bidder. These unfortunate men grumbled at this treatment. They declared they were freemen, who had hired themselves as mariners, and that it was grossly unjust to make them slaves. Of course these arguments went for nothing: the men had black or tawny skins, and by the colonial law they were liable to confiscation. One of these men was bought by a person whose house shortly after went on fire; immediately two or three other fires occurred in the city, including one in the government house, which was burnt with some adjoining buildings. Whether these fires were accidental, or the work of incendiaries, could not be discovered; but the cry was raised among the people, "It is the Spanish negroes!—take up the Spanish negroes!" They were immediately incarcerated, and a fire occurring in the afternoon of the same day, the rumour became general that the slaves in a body were concerned in these wicked attempts to burn the city. The military was turned out, and the sentries were posted in every part of the town, while there was a general search of the houses, and an examination of suspicious persons. The lieutenant-governor, at the request of the city authorities, offered a reward of £100 and a full pardon to any free white person who should discover the persons concerned in these incendiary acts,

and freedom, with a reward of £20, to any slave who should make the same discovery.

The offer of so tempting a reward induced a woman named Mary Burton to assume the office of informer. Some time before the outbreak of the fires, Mary had been a servant with a person named John Hughson, who kept a low tavern where negroes were in the habit of resorting. This man had been concerned in receiving some articles of which a house had been robbed, and in consequence of information given by his servant, he was seized and put in prison for this delinquency. Peggy Carey, a woman of infamous character, was also implicated in the robbery, and likewise committed to prison. It now seems to have occurred to Mary Burton that nothing would be more feasible than to attach the crime of incendiarism and insurrection to her late master, Hughson, and the woman Carey, along with three negroes, Caesar, Prince, and Cuffee; and she emitted a declaration to that effect. She stated that she had heard these two white and three black persons conspiring to burn the town and massacre the inhabitants. The governor, the lawyers, and all the people were aghast with horror. The plot was atrocious, and demanded the most careful inquiry, the most signal punishment.

Many examinations ensued, and among others that of the wretched woman Peggy Carey. Peggy was bad enough, but she had never entertained half so magnificent a project as that of burning New York, and denied all knowledge of the plot and its abettors. On second thoughts, however, as she saw she was in a scrape for having received stolen goods, it appeared to her that she might escape punishment by trumping up what was so much in demand—a little knowledge of the plot. She now made a voluntary confession, in which she laid the scene of the plot in the house of John Romme, a shoemaker, and keeper of a tavern frequented by several negroes, to whom Romme administered an oath. She said they were to attempt to burn the city; but if they did not succeed, they were to steal all they could, and be was to carry them to a strange country and give them their liberty. All the slaves mentioned by her were immediately arrested. Romme absconded, but was afterwards taken.

The narrative of what now took place may be best gathered from the 'American Criminal Trials,' by P. W. Chandler, a work of much interest, recently published.

On the 29th of May 1741, the negro slaves, Quack and Cuffee, were brought to trial before the supreme court, on a charge of a conspiracy to murder the inhabitants of the city of New York. The principal evidence against them came from Mary Burton. There was also some evidence against them from negroes. The prisoners had no counsel, while the attorney-general, assisted by two members of the bar, appeared against them. The evidence had little consistency, and was extremely loose and general. The arguments of the lawyers were chiefly declamatory respecting the horrible plot, of the existence of which, however, no sufficient evidence was introduced. "The monstrous ingratitude of this black tribe," was the language of one of them, in addressing the jury, "is what exceedingly aggravates their guilt. Their slavery among us is generally softened with great indulgence. They live without care; and are commonly better clothed and fed, and put to less labour, than the poor of most Christian countries. But notwithstanding all the kindness and tenderness with which they have been treated amongst us, yet this is the second attempt of the same kind that this brutish and bloody species of mankind have made within one age." The prisoners were immediately convicted, and were sentenced by one of the court, in an address singularly indicative of the general excitement on the subject, to be burnt to death. "You that were for destroying us without mercy," he said, "you abject wretches, the outcasts of the nations of the earth, are treated here with tenderness and humanity; and I wish I

could not say with too great indulgence, for you have grown wanton with excess of liberty, and your idleness has proved your ruin, having given you the opportunities of forming this villanous and detestable conspiracy. What hopes can you have of mercy in the other world, for shall not the judge of all the earth do right?" and he urged them to confess, as affording the only hope of mercy.

The prisoners protested their innocence, and utterly denied any knowledge of any plot whatever; but when they were taken out to execution, the poor creatures were much terrified; the officers again endeavoured to persuade them to confess, and after they were chained to the stake, and the executioner was ready to apply the torch, they admitted all that was required of them. An attempt was then made to procure a reprieve, but a great multitude had assembled to witness the executions, and the excitement was so great that it was considered impossible to return the prisoners to jail. They were accordingly burned at the stake. Although Hughson and his wife had already been tried, and were under sentence of death for the felony of receiving stolen goods, it was determined to bring them to another trial for being concerned in the conspiracy. Accordingly, on the 4th of June 1741, Hughson, his wife, his daughter, and Peggy Carey, were placed at the bar for trial. Mary Burton was at hand with her tales, and Arthur Price, a thief and an infamous character, who had been employed by the magistrates to go to Sarah Hughson and endeavour to make her accuse her father and mother, related a conversation he pretended to have had with her. The prisoners had no counsel, and almost every member of the bar appeared against them. The attorney-general made an address to the jury, which was full of outrageous invectives against Hughson. "Such a monster," he said, "will this Hughson appear before you, that, for the sake of the plunder he expected by setting in flames the king's house, and this whole city, he—remorseless he! counselled and encouraged the committing of all these most astonishing deeds of darkness, cruelty, and inhumanity—infamous Hughson! Gentlemen, this is that Hughson, whose name and most detestable conspiracies will no doubt be had in everlasting remembrance, to his eternal reproach, and stand recorded to the latest posterity. This is the man!—this, that grand incendiary!—that arch rebel against God, his king, and his country!—that devil incarnate, and chief agent of the Abaddon of the infernal pit and regions of darkness!"

The prisoners severally and solemnly protested their innocence, declared that what the witnesses had said against them was false, and called upon God to witness their asseverations. They were all found guilty, and were sentenced to be hanged. "Good God!" exclaimed the judge in pronouncing sentence, "when I reflect on the disorders, confusion, desolation, and havoc which the effect of your most wicked, most detestable, and diabolical counsels might have produced, had not the hand of our great and good God interposed, it shocks me; and you, who would have burnt and destroyed without mercy, ought to be served in a like manner."

The daughter of Hughson confessed and was saved. Peggy Carey had confessed, but retracted, and said that what she had confessed was a gross perjury, and that she had sworn falsely against those she accused. She was accordingly executed. On the evening before her death, she sent for one of the judges, and reiterated to him her statement that she had forsworn herself in regard to the plot. Hughson and his wife asserted their innocence to the last, but were executed. When the three came to die, Hughson seemed to expect a rescue; his wife was senseless; and Peggy Carey met her fate with less composure than either of the others.

Meanwhile, the trials were prosecuted with all possible vigour. On the 8th of June, six negroes were condemned to be chained to a stake and burned. On the 10th of June four more negroes were tried, convicted, and

subsequently received the same sentence; one of them immediately made a confession in court, implicating a large number of negroes. On the 13th of June five more were convicted, and on the 15th of the same month were sentenced to death. On the 17th of June five of the Spanish negroes were brought to trial. By a law of the province, the testimony of slaves could only be used against each other, and it was used in the present instance; but the prisoners complained bitterly of the injustice done them, insisting that they were freemen in their own country. The court decided, however, that they were slaves, and the evidence of slaves was properly used against them; they were all condemned. On the 19th of June the lieutenant-governor offered a full pardon to all who would make confession before the 1st of July. The poor negroes, being extremely terrified, were anxious to take the only avenue of safety that was offered, and each strove to tell a story as ingenious and horrible as he could manufacture. "Now," says the historian of the plot, "many negroes began to squeak, in order to lay hold of the benefit of the proclamation. Some who had been apprehended, but not indicted, and many who had been indicted and arraigned, who had pleaded not guilty, were disposed to retract their pleas and plead guilty, and throw themselves on the mercy of the court." In one week after the proclamation there were thirty additional slaves accused, and before the 15th of July forty-six negroes, on their arraignment at different times, pleaded guilty. Suspected slaves were daily arrested, until at length the prison became so full that there was danger of disease, and the court again called in the assistance of the members of the bar, who agreed to bear their respective shares in the fatigue of the several prosecutions.

While things were at this crisis, the cry of a negro plot became strangely mingled with a notion that the conspiracy was somehow fomented by the Roman Catholics—a Negro and Popish plot rolled into one—and this greatly aggravated the panic. Mary Burton, and William Kane, a soldier, who had himself been suspected, and escaped by confession, accused a nonjuring clergyman, named John Ury, who was living obscurely in New York, of meeting and conspiring with negroes. Nothing was too wild for belief. This poor gentleman, whose life appears to have been irreproachable, was brought to trial for the double offence of being a conspirator and a Roman Catholic priest. He pointedly denied both charges. He declared he was not a Roman Catholic, and we are led to infer from his defence, that he was one of those Scottish Episcopal clergymen, who, from conscientious motives, would not subscribe to the revolution settlement. The court, however, would give no credence to this acknowledgment: it held, contrary to all evidence, that he was a Roman Catholic priest; and according to the logic of the day, that was enough in itself to condemn him. When brought to the scaffold, he delivered a most affecting and pious address, solemnly denying all knowledge of the plot, and that he was even acquainted with Hughson, his wife, or the creature who was hanged with them. After the execution of this unfortunate man, a day of thanksgiving to Almighty God was observed by public command, 'for the deliverance of his majesty's subjects here from the destruction wherewith they were so generally threatened by the late execrable conspiracy.' The delusion continued a short time longer, and there was one more execution; but the public vengeance had been pretty well satiated, and prosecutions became unpopular, more especially as Mary Burton, the common informer, began to give out intimations against people of consequence in the city. The last act of the tragedy was the payment of this perjured creature by the city authorities of the reward of £100, originally offered to any one who would disclose the plot.

To sum up the cruelties perpetrated during the excitement: the number of persons taken into custody on suspicion was upwards of one hundred and fifty. Of these, four white persons were hanged; eleven negroes were

burnt; eighteen were hanged; and fifty were transported and sold, principally in the West Indies. Several persons who were suspected made their escape out of the colony. And all this, to the disgrace of the age, on no other ground than an idle public clamour. The whole, from first to last, had been an imposture and delusion.

POPULAR INFORMATION ON SCIENCE.

REPRODUCTION OF PLANTS.

THE main object of a plant during growth seems to be the reproduction of its kind. Whether the term of its existence be limited by a day, by a year, or by centuries, its sole effort—as it proceeds from leaf to stem, from stem to branch, and from branch to flower and fruit—is the multiplication of itself. This is effected variously: by seeds, by spores or germs, by tubers, by runners, which put forth shoots as they elongate, by branches which send down roots, by slips or detached branches, or even by single leaves. We shall notice the more remarkable of these modes, as exhibiting at once the perfection of design, and the inexhaustible contrivances which nature has ever at her adoption for the accomplishment of the end in view.

Increase by seed is the most familiar mode of reproduction, being common to all flowering plants. Seeds are merely leaves preserved in peculiar cements till the return of the season of growth. And here it may be remarked, that wherever we have a healthy-growing leaf, or number of leaves, there is no difficulty in rearing an independent plant, since, according to the doctrines of morphology, the leaf is the primary organ from which all other parts take their form and development. A numerous class of vegetables have their seeds composed of two leaves or lobes, as may be seen in the bean and apple; in another class, as the oat and cocoa-nut, they consist of a single lobe. But whether they have one or two lobes, in all of them the function of reproduction is of the most perfect description. To produce a fertile seed, the pollen or dusty granules which tip the stigmas must be conveyed to the pistil, and through the pistil to the embryo in the ovary. For this purpose a thousand beautiful adaptations have been called into existence. These precious granules, liable to be swept away by every breeze and shower, are protected by the sheltering calyx and corolla, which turn their backs to the wind, or droop like a pent-house to ward off the rain. And even should the pollen be scattered by accident, the pistil is covered with a fine mucilage, which intercepts and retains it in spite of every antagonist force. Some plants have the stamens and pistils in one and the same flower; in others the stigmas are in one flower and the pistil in another; while in not a few the male and female flowers are produced on separate stems—yet in all, the means of fertilisation are seldom rendered nugatory. If the male and female flowers are near, they are placed so as to be brought in contact by the slightest waving of a branch; or if distant, the passing breeze and the limbs of the wandering bee are the agents by which the pollen is carried to the destined receptacle. When properly matured, a seed must be provided, first, with the means of dispersion and preservation, and secondly, with a sufficiency of internal nourishment for the embryo plant, till its roots have struck into the soil, and its leaves have expanded in the atmosphere. Accordingly, some seeds are farinaceous, others albuminous; and many oleaginous—all of those products being converted, during germination, into those elements which enter into the structure of a growing plant. For

the conversion of these products, a certain amount of heat and moisture is necessary; but too much heat would parch them, and too much cold or moisture would destroy their vitality. To provide against such contingencies, nature has conferred on the seeds of plants the most ingenious and perfect coverings. The cocoa has a tough fibrous coat and woody nut, impervious alike to drought and rain; the chestnut has a compact leathery envelope; the plum a hard stony drupe; the apple a fleshy pome, enclosing leathery cells; the rose a fleshy hip, packed with down; the pea and bean a pod of parchment; and seeds apparently naked have either a coriaceous membrane, or have the exterior tissue so condensed, that they look as if they had come from the hand of the jannepier. Thus, the protection against cold, drought, moisture, and other destructive agencies is so complete, that seeds which have been buried for centuries have, on being brought to the surface, sprung up into healthy plants; even a crop of wheat has been reared from grain found in the case of an Egyptian mummy more than three thousand years old.

Equally perfect with this protection is the means for their dispersion over the surface of the globe. What could be better adapted for floating from island to island than the cocoa-nut, with its light, waterproof, fibrous coat and woody shell? What more easily caught up by the slightest breath of air than the seeds of the thistle or dandelion, with their little parachutes of down? Or what more aptly fitted for attachment to the coats of wandering animals than the hooked heads of the teasel and burdock? Nor does contrivance end here. Many, when ripe, are ejected from the vessels which contain them with considerable force by means of elastic valves and springs. The cardamine impatiens throws its ripe seed to a considerable distance on being touched; so does the squirting cucumber, the geranium, the common broom, and others, as if they were endowed with vitality, and had a care for their embryo progeny. Some do not even part with their seeds till these have struck root as independent plants. Thus the mangrove, which flourishes amid the mud of tropical deltas and creeks, retains its berries till they have sent down long thread-like radicles into the silt below, as if it felt that the water and slime by which it was surrounded were elements too unstable to be intrusted with its offspring.

Plants that reproduce themselves by spores or germs belong to the cryptogamic or flowerless class of vegetation, as the ferns, sea-weeds, mosses, and mushrooms. In many of these the reproductive spores are so minute, that they float in the air unseen; and not a dried mushroom or puff-ball that is struck by the wandering foot, but disperses thousands of its kind around it. The little brown specks on the leaf of the fern, the snuff-like powder of the puff-ball, or the dust arising from the mould of a decayed cheese, are all alike the germs of future plants; and when we consider how minute each individual is, how liable to be borne about by winds, by water, and by the coverings of animals, to which they may adhere, we shall cease to wonder at the fact, that there is not a portion of surface, organic or inorganic, that may not be covered with their growth. The spores of the fuci or sea-weeds, which are always surrounded by water, are covered with a mucilage that enables them to adhere to whatever solid body they touch; and, what is peculiar in this adhesive substance, it is insoluble in water. 'Let chemistry,' says Macculloch, in his *Illustrations of the Attributes of a God*, 'name another mucilage, another substance, which water cannot dissolve, though apparently already in solution with water, and then ask if this extraordinary secretion was not designed for the special end attained? and whether,

also, it does not afford an example of that Power which has only to will that it may produce what it desires, even by means the most improbable!

Many plants, as the potato, reproduce themselves both by seeds and tubers. Both modes, however, do not take place with equal exuberance at one and the same time. In its native region of South America, where the climate is better adapted for blossom and maturation of seed, the potato flowers luxuriantly, but yields an insignificant crop of small acrid tubers; in our unstable climate, on the other hand, the underground progeny is the more abundant and prolific. Acting upon the knowledge of this principle, the farmer in Europe cuts off the flower-buds of the potato-plant to increase his crop of tubers; just as the tulip or hyacinth-fancier prevents his plants from flowering, in order to increase the stock of his bulbs, which throw out a number of offsets from their bases. There is, it would seem, a certain amount of vital force in every plant, and if that force be expended on flowering, tubers will not be produced, and if on the production of an underground progeny, the seed will not be matured, as is the case with the horse-radish and Jerusalem artichoke. Here, however, it must be remarked, that tubers are not roots in the botanical sense of the word; they are true underground stems, which, instead of terminating in fruit and seed, terminate in nodes full of eyes or leaf-buds, and supplied with a quantity of farinaceous matter for the support of the young buds, till they have struck their roots in the soil sufficient to elaborate their own sustenance. Let any one unearth a potato plant with care, and he will at once perceive the difference between the true roots spreading out into minute fibres, and the underground stems terminating in tubers. The former are tough and fibrous, diverging into minute radicles, each tipped with its little sucking point or spongiole; the latter are soft and succulent, undivided, and ending in a mass of farinaceous matter studded with young buds. Each of these buds, if detached with a portion of the tuber, and placed in proper soil, will spring up into a perfect plant—the farinaceous fragment supplying it with food, until roots and leaves are formed.

The manner in which plants reproduce themselves *viviparously* differs according to the constitutional character of the individual. Some, as the elm and poplar, have their roots furnished with buds, which sooner or later sprout forth into offsets and suckers, as they are called, and these annually increase in bulk and height—ultimately becoming, under proper conditions, perfect trees. Others, as the greater number of bulbs and tubers, multiply themselves by sending out runners, each of which produce several young plants; and herbaceous perennials extend themselves in the same way, either by runners under ground, as the couch-grass, or above ground, as the strawberry. Most people must have observed the continual efforts of the latter plant to extend itself in this way; and so it is with many others—the propensity being most powerful where there is the least opportunity of bringing forth seed. It is often highly interesting to watch the progress of these runners. Where the soil is soft and favourable throughout, the young shoots are developed at about equal distances; but where the soil is hard, or covered with stones, the runner pushes its way over these obstructions, refusing to put forth a single bud until the proper conditions for its maintenance be reached. We have often seen a gravel-walk thus crossed by a strawberry runner, the runner being as budless as a piece of copper wire, until it had arrived at the soil on the other side, where it immediately put forth its young progeny in abundance. Instances of this kind are often ascribed to vegetable instinct; and were it not for the essential differences which evidently exist between vegetables and animals, one would be almost tempted to assign to it a higher designation. Some plants produce living seeds in the vessels where the ordinary seed is matured, as may be seen in certain species of the onion family—known as tree and apple onions; and others, like some of the

lilies, yield little perfect bulbs in the axils of the stem leaves.

Another manner in which trees multiply themselves is by their branches bending downwards till they touch the ground with the growing points, which then take root and spring up into independent stems. This frequently happens among trailing shrubs, as the bramble and honeysuckle, and may also be witnessed among our garden roses and gooseberries. A somewhat similar mode of extension is presented by the banyan, which becomes enlarged without the assistance of either seeds or suckers. Roots are produced by the under-side of the lower branches: these hang dangling in the air for months before they reach the ground; this at last they penetrate, and become stems to a new head of branches. An old tree of this kind presents a most magnificent object, forming concentric corridors over a great extent of surface. Acting upon the principles here pointed out by nature, gardeners propagate many of their favourites by layers; that is, by bending a branch or shoot till a portion of it be buried in the soil, where it throws out roots, and establishes itself as an independent plant. This being done, it is removed from the parent stock and placed in another situation.

Trees are also propagated by slips; that is, by detached young shoots being thrust into the soil, where they usually throw out roots, and grow up into healthy individuals. All plants of course cannot be slipped with the same facility; but, generally speaking, where there are well-developed leaf-buds in the axils of the perfect leaves, and where there is true wood formed, the slip will be found to take root and grow. Budding is another artificial mode of propagation: it is, in fact, merely slipping at an earlier stage of growth. In the one case there are many leaf-buds on a common stem, in the other there is only a single bud. The operation is performed by taking the leaf-bud from one tree, and neatly inserting it under the cuticle of another, where, fed by the necessary juices, it extends into a new bough or arm.

Perhaps the most curious mode of natural reproduction is that by the leaf. It is well known that many leaves, as those of the echeveria, malaxis, gloxinia, orange, and others, when fallen to the ground in a young and growing state, put forth roots and become perfect plants. This fact is at present exciting much attention; and since all parts of a plant are but special developments of this single organ, it is argued that there is nothing to prevent the propagation of any species of vegetation by this simple means. Considering the truth and universality of the doctrines of morphology, we cannot see why there should; and feel justified in the hope, that, once gardeners have arrived at a knowledge of the proper times and modes, they shall be enabled to rear any form of vegetation from this universal organ.

What a curious view of vegetable life do the principles of reproduction unfold! namely, that all parts of a plant—whether root, tuber, bulb, stem, branch, leaf, or seed—will, under certain conditions, grow up into a perfect individual, similar to the parent from which it has sprung. All modes do not take place at one and the same time, for nature is never prodigally wasteful of her resources; but where climate or other conditions interrupt production by one source, another is developed more exuberantly than usual to supply its place. If we have not conditions to mature fruit and seed, there will be tubers, or suckers, or runners instead: and just as the chances of failure are great, so are the modes of reproduction proportionally increased. There is nothing corresponding to this in the animal kingdom, unless among the very lowest forms, as the polyps and sponges, which also increase by division. Lop away a branch from a tree, and its place may be supplied by another; break off the limb of a crab or insect, and another limb will shortly take its place; but while the detached branch will spring up into a tree similar to its parent, all vitality has fled from the separated limb of the crustacean. Higher animals than insects and crustaceans

have no power to reproduce lost parts; but while devoid of this vegetative-like power, they have a more exalted sentient development; and if denied the power to reproduce a lost limb, they are endowed with faculties which can better protect them.

MADAME DE MIRAMION.

A ROMANCE OF REAL LIFE.

ROGER DE BUSSEY, Comte de Rabutin, having only daughters by his first wife, was desirous of contracting a second marriage, in the hope of obtaining an heir to his name, and his parents were equally anxious on the subject. He wished to meet with a wife who united fortune with youth and beauty, considering this essential to support his rank at court, and to enable him to satisfy his inclination for pleasure, and his other expensive tastes.

He frequently discussed the matter with his uncle, who was prior at the Temple, and with whom he lodged when he came to Paris. At the residence of that personage, he became acquainted with an old citizen called Le Bocage, the proprietor of a considerable domain in the neighbourhood of the district of which Bussey had the command. Invited by his nephew, the prior often made that place his residence during the summer months, and there the two relatives would sometimes live for weeks together. It was in this neighbourhood that Le Bocage, Christopher de Rabutin, and the Comte de Bussey became intimate. Made acquainted with the wishes of the last to form a wealthy connexion, Le Bocage proposed to him a young and beautiful widow, equally remarkable for her piety, the sweetness of her temper, and the possession of a large fortune. Le Bocage did not know her personally, but he had a friend in whom, as her confessor and spiritual adviser, the lady placed great confidence. He was a father of the Order of Mercy, called Father Clement, but a monk of corrupt morals, willing to engage in any profligate scheme for a pecuniary consideration. With this man Bussey had a conference, and by his connivance he managed to obtain a sight of the young widow on two occasions at church. He was enraptured with her person, but was not able either to address or to approach her. Father Clement assured him, however, that he had made a favourable impression, stating, at the same time, that she could do nothing without the consent of her family, who were bent on her marrying some one of the legal profession. He advised Bussey not to run any risks, and to allow him to act for him, and he would undertake to communicate with some of her more influential relations, and induce them to consent to the marriage. In case of their refusal, he agreed to persuade the widow to avail herself of her right to dispose of herself. To forward his plan, he obtained money from Bussey, under the pretext of bribing her domestics; and the latter, completely his dupe, made over to him at different times sums to the amount of 2000 crowns. As the period approached for the opening of the military campaign, the monk persuaded Bussey not to delay his departure for the army. He set off on the 6th of May 1648, having obtained a promise from his negotiator to inform him of his proceedings.

Three weeks after his departure, he received a letter telling him that the relations of the widow were adverse to the match, and that she had not the resolution to resist them; but that she was desirous that Bussey should, by an apparent act of violence, obtain the consent she was ready to give. But the true version of the tale was as follows:—The perfidious monk had not succeeded in his plan. The moment she was aware of his object, Madame de Miramion had dismissed him, and taken another confessor. In revenge, he was determined to avail himself of the credulity and audacity of Bussey. Pretending that, as confessor, he still possessed the confidence of the widow, he induced Bussey to believe that

she regarded him so favourably, that, if he carried her off by force, she would gladly take him as her husband. The young nobleman, thus deceived, determined on following his suggestions. A royal commission had been established by Cardinal Richelieu to oppose the encroachments and license of the nobles, who looked upon the placing themselves above the law as a privilege of caste. This new authority had not been so long formed as to enable them, in every instance, to prevent or punish the abuses they had undertaken to oppose; and the civil wars of La Fronde, whilst they weakened the government, had enabled the nobility to return to their previous habits of license and oppression—the more endeared to them as evidence of their former independence.

During these times of confusion, the cases of aggression on the part of those in power towards women of inferior rank, or those who, from belonging to the mercantile class, were without family support or connexion at court, were the more frequent, because they remained almost always unpunished.

As Bussey enjoyed the favour and protection of the Prince de Condé, he related to him the whole affair. The proposed adventure pleased the young prince, who offered to give his friend a commission at Paris, and even to make over to him the command of Bellegarde, one of his own places in Burgundy, in order to facilitate his plans. Bussey expressed his gratitude, and accepted the commission, but refused the offer with regard to Bellegarde; all he required was the means of transferring his beautiful prisoner to Lannay, where was an ancient castle, surrounded by thick walls, and only to be entered by drawbridges. No sooner, therefore, had he fulfilled the commission given to him by the prince, than he went to his coadjutor, who confirmed all he had previously written, and encouraged him in his scheme; not doubting, he said, that once separated from her family, Madame de Miramion would consent to marry him without difficulty.

Nothing could have been easier than for Bussey to have satisfied himself of the real state of the lady's feelings before adopting so desperate a measure; but whether his own self-conceit did not allow him to doubt of his success, or from shame of having been so duped, he declares in his own memoirs that his agent had no interest in it, beyond the wish to gratify a friend, and he could not therefore doubt the sincerity of Clement. It must be allowed also that the profession to which the father belonged, and the nature of his connexion with the young widow, were sufficient of themselves to allay suspicion; so that, whilst this innocent victim was totally ignorant of the pretensions of the comte, or even of his wish to marry her, no one having given a hint on the subject, Bussey was firmly persuaded that she had not only given her consent, but had long since been made acquainted with his intentions.

Madame de Miramion was the daughter of a rich bourgeois of Orleans. A child of precocious understanding, she doted on her mother with an energy beyond her years; and when, at scarcely nine years of age, she was deprived by death of this beloved parent, the event made a deep and lasting impression on her sensitive nature, which seemed to resist every effort made to dispel it. One of her aunts, who had the charge of her education, though the sister of a bishop, considered that religious fervour was taking too strong a hold on the mind of her young pupil; and in some measure to counteract it, she drew her into society, and took her to balls and to the theatre. Wherever she went, the beauty of her person, more than her wealth, attracted universal admiration, and many were the suitors for her hand. In 1645 she married Jean Jacques de Beauharnois, lord of Miramion, counsellor of the parliament of Paris, whose fortune equalled her own. He was only twenty-seven years of age, handsome, with a commanding figure, and of a most amiable disposition. By her husband she was not restrained, as by her aunt, in her pious exercises. So well assorted a union made her feel a happiness to

which she had been a stranger from childhood. She loved and was beloved. She had but one wish, by the strict discharge of every duty not to allow her prospect of future welfare to be endangered by the prosperity and happiness she enjoyed in this life. Only six months passed in the enjoyment of this happiness: at the end of that period her husband was taken from her by a pulmonary attack. Soon after, she gave birth to a daughter, so weak and sickly that it was with the utmost difficulty her life could be preserved. Religion and maternal tenderness prevented Madame de Miramion from sinking in despair; she passed the two first years of her widowhood in the closest seclusion, alternately at the foot of the altar, and by the cradle of her child.

Born in 1629, she was little more than sixteen when she became a widow and a mother. Her relations, who were tenderly attached to her, feared she would take the veil. They wished to keep her amongst them, and flattered themselves, from her extreme youth, that she might in time be induced to form a second connexion; and having allowed her a long period for the indulgence of her grief, they proposed it to her. Several brilliant offers presented themselves. Many of those who sought her feared that her beauty and her wealth might give reason to suspect the disinterestedness of their attachment; but on every occasion she expressed in the strongest terms her wish to reject all proposals of the kind. Attacked by the small-pox, she was sorry it had not deprived her of those attractions which her piety caused her to regret; and yet, deeply touched with the attachment of her relations, she did not like entirely to close her doors against those they sought to introduce to her acquaintance.

Her humility made her consider herself unworthy to consecrate herself to heaven. She hesitated, and only asked for time to be allowed her to make her decision; and in the meanwhile she multiplied her acts of devotion, in the hope that God would reveal himself to her and declare his will, whilst her friends pleased themselves with the hope of obtaining her consent to an alliance with some family equally rich with their own.

Such was the person whom Bussy, without any personal acquaintance, proposed to carry off and force into wedlock, persuaded that she would consider herself honoured in belonging to him, and would be gratified in appearing at a court from which her birth and the rank of her family precluded her.

Secure in the support of the prince, he looked upon an elopement with a female, who, notwithstanding her wealth, was in his eyes only a bourgeois, as a matter of no consequence. The elder brother of Madame de Miramion, then twenty-five years of age, was the only individual in the family to cause him any uneasiness.

His preparations were not so secret that they did not in some degree transpire. Madame had notice given her from various quarters that she was to be carried off; but as the author of the intended insult was not named, and as she was convinced that no one of those who aspired to her hand could be guilty of such an outrage, she placed no reliance in the report, and took no precautions to ward it off.

Bussy knew that she was living at Issy with her mother-in-law, and had obtained information from thence in his confidence that on the 7th of August she was to go to St Valerien to perform her devotions, and he arranged his plans accordingly. He placed four relays betwixt St Cloud and Lannay, a distance of twenty-five leagues. He assembled a strong escort, composed of his brother, a friend who had served two campaigns as a volunteer under his orders, and three other gentlemen, his vassals and dependents. They were attended by servants all well mounted and armed.

Madame de Miramion, entirely engrossed with the religious duties she was about to perform, set off from Issy at seven in the morning. Her mother-in-law accompanied her, and, according to the custom with

persons of a certain condition at that period, she was attended by an old eunuch and two women; the one a governess, a middle-aged person, the other a young chambermaid. A man-servant was mounted behind.

Bussy's squadron was posted on the road betwixt St Cloud and Mont Valerien, opposite a bridge, which the lady's carriage had no sooner traversed than it was stopped. Two of the cavaliers attempted to let down the leather curtains which shut up the persons within from their view. Madame de Miramion endeavoured to drive them off by striking them with a bag she held in her hand, and calling loudly for help; but her cries and her efforts were unavailing. Not being able to succeed in letting down the curtains, her assailants attempted to cut the fastenings with their swords. Madame de Miramion, with a courage beyond her sex, endeavoured to wrest the weapons from them, and in doing so, had her hands severely cut. During this unequal combat, the squadron had forced the coachman to repossess the bridge, and to enter the Bois de Boulogne, where a carriage was in waiting, drawn by six horses. In this Bussy would have placed the lady, but no persuasion could induce her to move; and, she fixed herself so firmly in her seat, that nothing but violence could have been availing. Bussy, therefore, unharnessed her horses, replaced them with his own, placed Madame de Miramion's coachman and horses in the charge of two grooms, with orders to convey them to Paris and detain them there, and then set off at full gallop across the plain of St Denis, into the forest of Livri. The captive lady called to all the passers by, gave her name, and intreated them to forward the alarm to her friends at Paris. But the clouds of dust caused by so large a cavalcade, the wind, the noise, and the rapid pace at which they proceeded, frustrated all her efforts. Having reached the forest, where, from the nature of the road the escort could no longer surround the carriage, Madame de Miramion made an attempt to escape, by throwing herself into a thick copse, where she flattered herself she might remain concealed, heedless of the thorns and briars which covered her with blood; but she was soon discovered, and, perceiving she could not avoid her pursuers, to prevent them from seizing her, with a violent effort she flew back to the carriage, and threw herself into it.

Bussy halted in the most retired part of the forest, where the escort took some refreshment; but his captive positively refused what was offered to her, declaring she would touch nothing till restored to liberty.

Still deceived with regard to her conduct, and astonished at her resistance, Bussy flattered himself that it was a faint on her part, and that she would become more tranquil if her mother-in-law and the old domestic were disposed of. He therefore turned them out, and the governess out of the carriage. He would only have retained the other female, but the man-servant declared he would rather die than abandon her. Whenever they stopped she made the same ineffectual efforts to obtain assistance; but those who guarded her gave out that she was insane, and her disordered appearance, her torn clothes, her bleeding face and hands, gave a colour to the assertion.

Bussy was now but too well convinced that her resistance was not feigned, and for a moment he thought of taking her back, but was dissuaded from it by his brother, who represented to him that when her alarm had subsided, she might be prevailed upon to change her mind. Arrived at the castle, the noise of the portcullis, the dismal appearance of the structure, the number of armed men collected, all contributed to increase her alarm. She did not even know the names, or the intentions of her enemies; but from the whole of their conduct, she considered them capable of the worst crimes, and nothing could induce her to quit the carriage. At length one of the party, a knight of Malta, whom she recognised as having made part of the escort, intreated her in the most respectful manner to enter the castle, and to be lodged in the palace of the Countess.

Madame de Miramion, without moving, inquired in a firm voice whether it was by the order of the person who addressed her that she was thus treated. 'No, madame,' said he, 'it is the Comte de Bussy-Rabutin, who has assured us that he was acting with your consent.'

'It is false, utterly false!' she exclaimed, raising her voice.

'Madame,' said he, 'we are here two hundred gentlemen, friends of Monsieur de Bussy; if he has deceived us, we will protect you, and restore you to liberty; only condescend to explain yourself more fully, and in the meantime do not refuse to dismount, and give yourself some repose.'

His respectful manner inspired her with confidence; she would not enter any of the furnished apartments, but remained in a low damp hall, where no preparation had been made for her reception, but where a fire was lighted in great haste, and her carriage-cushions were placed for her to sit upon. On entering, she observed a pair of pistols on the table, and instantly took possession of them; and finding them loaded, placed them by her. Her attendant having attempted to leave the room, she insisted on her not quitting her: they brought her food, but she would touch nothing. Bussy, afraid of encountering her reproaches, kept aloof: he was amazed at her anger and her decision. 'I had been assured,' he said to his accomplices, 'that she was a lamb, whereas she is more like an enraged lioness.'

Still he did not despair of softening her, by employing a person who acted as governess or housekeeper in the castle, and others to speak in his behalf; assuring her of his attachment, of his regret, and throwing all the blame upon her confessor.

These explanations in some degree dissipated her alarm, but did not lessen her indignation against her captor, who had employed such means to gain his object. When they found her inaccessible to persuasion, they tried to work upon her fears. They described the comte, though naturally mild and generous, yet capable of everything if his passions were excited; and that it was her interest not to reduce him to despair. But nothing could produce the least concession on her part; and at length Bussy sent her word, that she should be restored to liberty on condition of her granting him one moment's interview.

The instant he entered she rose from her seat, and exclaimed with an uplifted hand, 'Sir, I vow in the presence of God, my Maker and yours, never to become your wife!' and then fainted away. Medical assistance was procured; she was declared to be in imminent danger; thirty hours had passed without her taking nourishment, and her strength was exhausted.

In the meantime her mother-in-law had not been idle. She had made the best of her way to the nearest village, procured a horse for the old equerry, and despatched him to her family to give notice of what had occurred, whilst she secured a wagon for herself, which conveyed her to Paris. It was shortly after announced to Bussy that the town of Sens was in an uproar, and that six hundred men were coming to attack the castle. Noways alarmed at the intelligence, he made a last attempt to induce Madame de Miramion to remain at least one day at Lannay. Her only reply was a request that he would instantly give orders for her departure. The horses being harnessed, and the carriage in readiness, she ate two eggs; Bussy in secret gave fifty louis to her maid, under pretence of defraying the expenses of her journey, but in reality to make her favourable to his views. The carriage set off, escorted by the knight of Malta and two other gentlemen; the whole journey he rode by her side, endeavouring by his conversation and representations to place the comte's conduct in a favourable light; but on approaching Sens, fearful that they might be arrested by the authorities, they halted at the outskirts of the town, and having unharnessed the horses, the escort took their leave, and galloped back to Lannay. Madame de Miramion, left alone with her two attendants,

dismounted from her carriage, and traversing the faubourg of Sens on foot, found the gates closed. She learned, however, that every one was under arms, by the order of the queen regent, for the rescue of a lady who had been forcibly carried off. 'Alas!' said she, 'I am that person!' The news instantly spread; her brother, her mother-in-law, and her other relations soon joined her. Great was her joy to find herself once more amongst them; but her frame had received a severe shock. She fell dangerously ill, and for a long time her recovery was doubtful. A troop of armed men in the meanwhile was sent to Lannay to seize the person of Bussy, but he had made his escape, with all his accomplices.

When the trial came on, Madame de Miramion showed the greatest leniency, and intreated her family to pardon a repentant culprit. They were the less disposed to do so, because after this event she showed herself more averse than ever to every proposal of marriage. She considered it as a warning from heaven, and determined from henceforth to dedicate herself to religion and good works. Bussy, alarmed at the scrape he had got into, intreated the Prince de Condé to interfere in his behalf, who, in consequence, wrote to her family a very urgent letter. The solicitations of a prince who, by the victory of Sens, had again saved France, were not to be resisted; the suit was dropped, but was renewed when Condé and Bussy made war against the parliament and La Fronde. Bussy acknowledges that in the course of these civil disturbances he had formed a plan of burning the castle of Raballe, the property of Madame de Miramion; but his better feelings prevailed, and he placed a guard there to protect it, and he reaped the benefit of his good conduct.

The prosecution was dropped altogether on condition of his never appearing in her presence, and avoiding any place where she might be.

However humiliating was such a promise, he adhered faithfully to it. Thirty-six years passed, during which they never met. At the end of that period he was engaged in a lawsuit, the loss or gain of which depended on the President de Nesmond, who had married Madame de Miramion's only daughter. To do away the injury which the recollection of his past conduct might have upon the mind of her son-in-law, he determined, through the intervention of a friend of his, and a cousin of Madame de Miramion's, to obtain an interview with her. Admitted into the presence of one who had been connected with so remarkable an event in his life, he encountered no longer the young and delicate beauty clothed in silk and lace, such as she was when he carried her off from St Cloud, but a large fat woman, her head enclosed in an enormous coiffure, dressed in a gray woollen gown, with a deep cambric cape without any trimming, and her only ornament a cross, from which was suspended a lock of her daughter's hair. Her eyes still retained their brilliancy, and the charms of her features were not entirely lost under the disguise of a double chin. The expression of her countenance, her manner, her costume, were all in unison; all contributed to express the absence of tumultuous passions and the equanimity of her temper. Bussy was so struck that he remained for a time silent; but he was soon reassured by the tone of benevolence in which she addressed him, and the anxiety she expressed to learn the motive of his visit. When he had explained himself, and had proved to her satisfactorily that the right was on his side, Madame de Miramion promised to interest her son-in-law in his cause, and induce him to give it a favourable hearing; it came on shortly after, and was decided in his favour. All those acquainted with the history of the times will recognise Madame de Miramion in this generous conduct. This excellent woman, having made a vow to consecrate herself to God, preferred her duties as a parent to the illness of a daughter; devoting herself to the care of her child, who was almost always ill, the best years of her life were given up to her education. Having introduced her to

the world, and secured her happiness by a suitable marriage, discharging herself of all worldly cares, she gave herself up to the most enthusiastic charity; her strength of body and the resources of her mind seeming to increase in proportion to the amount of misery that surrounded her. She founded establishments at Paris, Amlens, and other places, bearing her name, for the instruction of schoolmistresses, and for nurses for the poor; she opened workshops for the industrious, and houses of refuge for the repentant sinner. During two years, from her own means she supported seven hundred poor persons who had been dismissed from the general hospital for want of funds. She assisted St Vincent de Paul in establishing a founding hospital; and when the town of Melun was visited by a contagious disorder, she relieved the sick by every means in her power, and for two months—braving death in her own person—she nursed those whose relations and friends had abandoned them from fear. She contributed by her liberality to the establishment of foreign missions, and caused the name of France to be blessed to the extremities of the world. Prostrate on her knees before an irritated father, she averted the curse about to be bestowed upon an offending son, and obtained his pardon. Even princesses sought her advice in their difficulties, and implored the consolation of her presence and her prayers in their last moments. Louis XIV., with that discernment which characterised him, employed her as his almoner in the distribution of his charities, and she was consulted on all sides by those engaged in works of charity and benevolence. Madame de Sévigné in her letters designates her as 'the Mother of the Church,' and says with truth that her death, which took place in 1696, was a public loss.*

USE OF OPIATES AMONG THE OPERATIVE POPULATION.

Among the numerous causes of disease and death brought to light by the publication of the report of the Health of Towns Committee, there is one to which but little attention has been paid; and yet, as appears from the statements of Dr Lyon Playfair, it is an evil of a most serious character, widely spread, and one that saps the vitals of the labouring population at their very source. The details in great part will appear incredible to those who are unacquainted with the habits of the poorer classes.

We have been accustomed to read with feelings of horror of the prevalence of infanticide in some of our Indian provinces; but what shall we think of the habitual practice of administering opiates to infants from their very birth, to lull them to quietness while their mothers are working in the factories?—in too many cases, unhappily, careless of the appalling consequences of their indiscretion, which show themselves eventually in the deformity, disease, or death of their offspring.

'The custom first originated,' says Dr Playfair, 'according to all concurrent evidence, in the frequency of disorders, having their primary seat either in the stomach or bowels, arising partly from injudicious feeding and improper nursing, but principally from the irritability produced by their continued exposure to a polluted atmosphere, and other physical causes of disease. The children thus disordered were taken to unlicensed practitioners, who prescribed opiates as a general remedy, and their mothers mistook the soothing effects produced by narcotics for proofs of improvement, and themselves continued the practice. They soon discovered that the administration of narcotic drugs prevented restlessness in the child, enabling them to pur-

sue their ordinary avocations; and thus a practice, often originating in disease, has become habitual, even in cases where disease did not exist. Druggists who vend such narcotic preparations speak as to the extent of their use; and their evidence is perhaps the more to be depended upon, as it was their interest to diminish rather than to exaggerate the extent of the evil.' He goes on to give the evidence of 'a respectable druggist in Manchester, whose customers are, however, entirely of the poorer class, among whom it may safely be said that there is scarcely a single family in which this practice does not prevail. The way it is done is this: the mother goes out to her work in the morning, leaving her child in charge either of a woman who cannot be troubled with it, or with another child of perhaps ten years old. A dose of "quietness" is therefore given to the child to prevent it being troublesome. The child thus drugged sleeps, and may waken at dinner-time; so when the mother goes out again, the child receives another dose. Well, the mother and father come home at night quite fatigued, and as they must rise early to begin work for the day, they must sleep undisturbed by the child; so it is again drugged, and in this manner young children are often drugged three times in each day. This druggist states further that he sells, in retail alone, about five gallons per week of "quietness," and half a gallon of "Godfrey," the strength of the former preparation is such as to contain one hundred drops of laudanum in an ounce; a single teaspoonful is the prescribed dose; so that, allowing one ounce weekly to each family, this one druggist supplies 700 families every week.'

A melancholy characteristic of this fatal practice is the unconcern with which it is followed. Another druggist says, there is 'no dread of laudanum now; it is often used for the same purposes as "quietness." The usual dose to produce sleep in a restless child is eight drops, and this being, like the other, gradually increased to three doses a-day, amount to twenty-four drops.' We are informed that 'three druggists, whose evidence is just quoted, "all of acknowledged respectability, are selling respectively five-and-a-half, three-and-a-half, and one—in all ten gallons weekly; two of them testifying that almost all the families of the poor in that district habitually drug their children with opiates; and the third, after a lengthened examination of all the customers who attended a pawnbroker's shop, kept by a relative of his own, giving as a statistical result, that five out of six families in his district were in the habitual use of narcotics for children.'

In the report furnished by the Rev. J. Clay, on the sanitary condition of Preston,* there is a table illustrative of the proportions of infantile deaths in the dispensary, and in the worst streets: in the former the proportion is, in even numbers, 8 per cent.; in the latter 44 per cent.—a most striking difference, which is accounted for by the fact that, 'if the wretched inhabitants of these worst streets sought medical aid at all, they would seek it most likely where it could be obtained without charge. If the druggist is sometimes applied to for the medicine, which with greater propriety and safety would be prescribed by the medical man, he is too often asked for compounds which no medical man would prescribe; such as "Godfrey's Cordial," "Infants' Preservative," "Soothing Syrup," "Mothers' Blessing," &c. Returns have been obtained from almost all the chemists and druggists in Preston of the quantity of these mixtures sold by each; the aggregate of the whole quantity indicates that, allowing half an ounce per week to each family, upwards of 1600 families are in the habit of using "Godfrey's Cordial," or some other equally injurious compound.' Mr Robert Brown, a surgeon, states, 'A child was brought to me for a little aperient medicine; the mother suspected that the person who nursed it had been in the habit of giving it some narcotic. It had not had more than two or three motions

* The above has been translated from a French work by the Baron Walckenaer, entitled 'Memoirs Relating to the Life and Writings of Madame de Sévigné.'

* See First Report, page 183.

for the space of three weeks. I advised the mother to stay at home and attend to it herself. The advice was followed, and the child recovered in a few days.'

It may be thought that the evils here pointed out being moral rather than physical, admit easily of the application of the proper remedies; but it is observed that 'the thoughtlessness and unreflecting ignorance of many parents, and the callousness towards their offspring of others, is stronger than the parental feeling, which will lead, in numerous instances, to the indiscriminate administration of opiates and spirituous liquors to sick children.'

'Similar evidence as to the prevalence of the custom is given by druggists in all the towns visited. In Wigan, four druggists examined agree in describing the practice as "very prevalent among the lower orders," and in stating that it appears to prevail with all those who have occupations in factories, workshops, and other places at a distance from home, which oblige mothers to leave their children the whole or greatest part of a day.' The same statements were made by druggists at Rochdale and Bury; and Mr Whitehead, the registrar for Ashton-under-Lyne, says, 'I conceive that the practice of administering opiates to children is very prevalent among the working-classes, and I think more particularly where there are natural children born, and left in charge of the keepers of houses where the mothers lodge, while the latter are working in the mill. In going to register deaths, I have frequently remarked children looking very ill, and on observing this to the neighbours, they have said, "It is no wonder that they are so—they are slept to death;" meaning that sleeping stuffs were given to them.'

The same fatal practice prevails also in Liverpool, accompanied, among the Irish population, by the administration of ardent spirits; equally destructive of human life. In fact, in the whole of Lancashire and the factory districts generally, the evil has been adopted with the most reckless disregard of consequences. The painful surprise which the perusal of these statements produces will, however, be diminished when we read that 'it is no uncommon thing to meet with married females at fifteen, and they are frequently mothers at seventeen; the fathers being but little older. To increase the bearing of this cause upon the mortality of children in the manufacturing districts, comes the fact, that in two, three, or four weeks after delivery, the young mother, if she have but one, two, or three children, returns to her work in the mills, leaving the charge of her children either to some old woman or young girl, or puts them out to nurse. The effects of this unnatural treatment are visible upon the infant in a very short time. A child, born apparently strong and healthy, may almost always be known two or three months after birth if it belong to a mother who goes to the factory. Instead of being plump and growing, it is almost invariably emaciated and less than at birth—commonly wasted by continued diarrhoea, brought on by the manner of its diet. The mother suckles it but at meal times and at night; the milk, having been so long secreted, is too stimulating for the child, and the succedaneous food, in quantity and kind, adds to the irritation. The greatest ignorance prevails as to the organisation and requirements of a child as regards diet. It is no uncommon thing to be consulted for emaciated children with extensive mesenteric disease; and on inquiry, to find that the food consists in great part of bacon, fried meat, and fatty potatoes, when the infant has not perhaps two teeth in each jaw to masticate it.* I am convinced of the great bearing of these facts upon the mortality of children, from the circumstance that a greater proportional number of first and second children die before they attain five years of age, than of children born after the mother has relinquished her factory employment.† While much of this great mortality may

doubtless be traced to the extremes of poverty so often met with in manufacturing districts, there is ample evidence of the waste of infant life from the causes in question; for in Wiltshire and Dorsetshire, where the wages are notoriously low, only 11 per cent. of all the children born die before they attain one year of age, while 17 per cent. are carried off in Lancashire. Dr Playfair observes that, 'in the small town of Clitheroe, the population of which, amounting to 6785, consisting partly of calico-printers, and partly of factory operatives, I found a weekly sale of four pints of Godfrey's Cordial, and an annual sale of 4000 poppy heads, for making "sleeping tea for children." One druggist describes these drugs as being sold "to an alarming extent among the factory population: not so much so among printers." Another describes the sale "as decent for the size of the town."'

The evil is not only serious in its actual effects, but in prospect; all the inquiries made on the subject elicited proofs of its alarming increase, with a tendency upwards to the middle classes; it has been alleged, though without any clear foundation, that the increase arises from the 'temperance movement'; the use of fermented liquors being supplied by that of opiates. But the whole weight of medical testimony is directly opposed to their exhibition. We are told that 'the administration of this class of medicines requires the greatest skill in the physician. Nothing is more uncertain than the effects of opium upon young subjects; and it ought never to be employed, even by medical men, except with the greatest caution, as it sometimes acts with much violence, and has proved deleterious even in very small doses. Half a drachm of genuine syrup of white poppy, and, in some instances, a few drops of "Dalby's Carmine" has proved fatal in the course of a few hours to very young infants.'

In summing up the evidence, we encounter evils still more fearfully impressive. Who that has felt the endearing relation of infantile existence, can fail of being moved by the statement of a druggist who says, 'it is curious to see the children in the shop; they stretch out their little hands, for they know the bottle, and when they get it, drink it as eagerly as the drunkard does his glass. I have seen the little children in the shop put the neck of the bottle in their mouths and bite the cork, so fond are they of the preparation; for coming to the shop so often, they know the bottle.'

We read of a child who had been so much habituated to the drugs, that it 'took 100 drops of laudanum during the day; and of parents 'who are in the habit of giving their children these drugs when the child is only three or four weeks old, and in many instances younger: this is gradually increased to a double dose, until at last some children will take six drachms a-day to produce the same effect as half a drachm did when they first began to take it.'

There is no difference of opinion among the witnesses as to the extent of the evil, which is felt not only in the loss by death, but in the deterioration and destruction of the mental and physical powers of those who survive the treatment. Dr Playfair states that 'instances have been brought before him in which idiocy and insanity have certainly followed as the result of the practice; and further, 'I have been led by laborious inquiry to the conclusion, that the custom of administering narcotics to children originated primarily in, and is upheld by, the physical causes of disease acting upon the younger portion of the community. On the removal of these causes, the general inducement to the continuance of the system would cease, for the irritability and difficulty of management of children would diminish with their increased health. It is an evil not confined to factory districts, as some have alleged, for the recent trials in Wales have shown it to be very prevalent in rural districts; and numerous inquiries in small towns in agricultural counties have convinced me of its exist-

once there, though to a much less extent. The diffusion of knowledge, and, above all, the removal of the physical causes of disease, will go far to check this great evil.

We would gladly indulge the hope that our endeavour to set forth the horrible results of this practice, may be the means of directing such attention to it as will tend to diminish or remove it altogether. We agree with Dr Playfair that to education alone are we to look for the real remedy; 'much may be done with the people as well as for them. Health is as dear to the poor as to the rich. The most abject part of the population—creatures who belong to no class, but are the reprobates, unfortunate, fallen of all classes and several races—can understand its value, and, as we know, are capable of making sacrifices for the good of others; what may not then be expected from the great mass of the labouring English population, from the intelligent artisans of towns, who are so apt in acquiring their difficult arts, and are certainly not surpassed by other classes in the facility with which they grasp and carry out a scientific principle clearly announced? To leave many things to the people themselves will be to proceed slowly, because knowledge and new principles can only be communicated slowly, but it will be to proceed surely; and the improvement will not die away or be superficial, for it will be the act of the mind, penetrate the inner recesses of home, and be imparted to future generations.'*

A SKETCH OF THE HOUSE OF LORDS.

A STRANGER entering the old House of Lords could hardly have failed to be struck with some degree of awe, if not from consideration of its being the meeting-place of the highest assembly in Britain, at least from the historical associations connected with it. Before him stood the gorgeous throne which Henry VII., despite his avarice, had adorned, and the bulky figure of Henry VIII. had filled. On its steps had knelt Anne Boleyn, when she sued, but sued in vain, for mercy. On it Edward VI. had reclined, when his frame was so attenuated by disease, and the medical art stood so low, that, despairing of relief from the faculty, his minister, says Hume, 'had resorted to the assistance of an old woman, or a witch.' There had sat his sister, the saturnine, bigoted, yet fond, faithful, and upright Mary Tudor: and there, in succession, the masculine and lion-hearted Elizabeth, after she had sealed the fate of the lovely, hapless, but faithless Mary Stuart. James had there been addressed by Bacon; and there had Charles whispered with Laud and Strafford. That throne had been cast aside as lumber by the astute and daring Cromwell, who cared little for either throne, or mace, or 'bauble,' or any other emblem of power, so long as he retained the substance. The tapestry which overhung the chamber walls had commemorated the defeat of the Spanish Armada and witnessed the triumph of the Reform Bill: and with many another striking scene of history that throne was identified, until the fire of 1834 consigned it to the recollections of the past.

The aspect of the present house is different, but still impressive. On entering, you perceive a long, narrow, red painted chamber, surmounted by a gallery, which in some degree obscures its light at one extremity, and terminating, in consequence of the absence of a window, in a still deeper gloom where stands the throne at the other. The appearance of the place is rather what would be called 'neat' than splendid. Its prevailing red, however, gives it an aspect of regality, though monotonous; and even the most frivolous spectator must be struck with the recollection, that here the laws of England are confirmed, and that even the Commons are obliged to stand uncovered in its precincts. It is the highest court in the kingdom, and yet the one to which access is most readily obtained. A stranger, when an absorbing case of swindling is being investi-

gated, may have some difficulty in finding his way into a police court; and when an interesting murderer is to be tried, he will assuredly be excluded from the Old Bailey, unless—*malgré* all the orders and admonitions of judges and aldermen—he propitiates the attendant Cerberus with some shining current coin; but into the House of Lords, when in the morning they are sitting in appeal, overturning the decisions of half the judges, and disposing the interests of half the realm, he will be courteously shown by one of the attendant gentlemen doorkeepers; for all the doorkeepers of both houses are gentlemen in appearance, and most of them so in station too; the salaries of the offices being so high, and their duties so small, as to render them appointments to many exceedingly desirable. On passing the threshold, he will find the chamber much as we have described it, and in addition he will see a grave yet courteous, dignified but graceful, stern yet suave personage, in full flowing wig, before him; a bishop, in wig of less ample dimensions, and lawn sleeves—though frequently also in private dress, and distinguished only by the never-abandoned 'apron,' and primly upturned clerical hat—with some respectable-looking elderly man on one side, and on the other two of more active and business-like character. The first is the chancellor, Lord Lyndhurst, whose highly polished appearance and refined placid demeanour strangely disappoint those who, from his speeches and his reputation, would be prepared to find in him the representation of Mephistophiles or Macbiavel at least; the respectable-looking man beside him, on the right or ministerial side of the house, is some member of England's hereditary nobility, whose acres or whose ancestors are better known than himself. The personages on the opposition benches are Lords Brougham and Campbell, two retired law officers, who thus do their best to make a return to the country for the pensions which they enjoy.

On another day, and at another hour, if he have interest enough—but this is a difficult matter—to procure a ticket from the lord chamberlain, let him go in, and he will there find the sovereign assembled amid England's congregated peers. Heedless of what is passing out of doors—careless of the splendour of the pageantry and the glories of the Park, the prancing of the horsemen and the acclamations of the crowd, the blaze of St James's and the crush of Whitehall—he must take his seat at least two hours before; and even then he will find the chamber beginning to be filled with the beauty and nobility of England. Nor do foreign lands fail to add lustre to the scene. In yonder box, allotted to the ambassadors, may be described the splendour of Austria, the coarser magnificence of Russia, the dark-eyed beauties of the peninsular embassies, the graceful gaiety of the French, with the elegant frivolity of some Italian state. An Indian prince, in eastern decoration, perhaps imparts variety to the nodding plumes; and there, generally in red capote, will be found the solemn, small-pozed Turkish envoy, looking imperturbable on all around. Two o'clock approaches—the boom of the Park guns announcing the queen's arrival is heard; the trumpet, resounding through the vaulted aisles, strikes the ear, so soon as she alights from her vehicle; a flourish re-echoes its notes from the martial band; the inspiring strains of 'God save the queen,' are raised; a few minutes are passed in the robing-room to don the paraphernalia of royalty; and, preceded by her chief minister in the upper house, bearing the sword of state erect in his hand, the queen of England appears amongst her peers. Led by her consort, and with her long train supported behind, she assumes her seat upon the throne: all rise on her approach; but she gracefully bids them be seated. The usher of the black rod—an old dignified-looking man—is enjoined to summon the 'faithful Commons' to attend: another space of a few minutes elapses, during which her majesty generally chats with some royal uncle or noble attendant. By and by a pattering noise is heard at a distance, and gradually in-

* Fifth Report—Registrar-General.

creates in loudness if not distinctness. Soon it assumes a nearer sound; and, with their speaker, and scarcely less important place at their head, in burst the representatives of the people. 'Order, order!' is perhaps heard from the lips of the chancellor, re-echoed by the voice of the speaker, if they be especially unruly; and, receiving it from her conscience-keeper on bended knee, her majesty, with marked and distinct elevation, delivers that royal speech which is generally anticipated with so much eagerness, and received with so little satisfaction. In twenty minutes the whole is over; the royal cortege departs as it came; the house breaks up; and the stranger is left to moralise—if moralist he be—upon the idle pageantry of the scene.

Let him return to the house about five o'clock, and if he obtain admission by a peer's order, he will find it of a character somewhat more intellectual. The lord chancellor then reads her majesty's 'most gracious speech,' as it is termed, to the surrounding senators; and some noble lord, little known to fame, who then generally makes his first appearance as a speaker, rises to propose an address in return, with the originality of which her majesty cannot fail to be eminently struck, inasmuch as it is invariably an echo of her own words. Nor, if she read the morning papers, will she often find reason to complain that the noble lord has wandered from his subject, as every sentence of his speech is generally but an amplification or paraphrase of her own, delivered in accents by no means so fluent or agreeable, but often repetitious and redundant, until they are cut down to something like form and propriety by the gentleness of the fourth estate. When he has 'said his say'—generally a very painful process—the speaker sits down; and another noble lord, of whom the world at large usually knows about as much, gets up, goes 'over the same ground, hammers at the same thoughts, stammers at the same words, hopes their lordships' will excuse his inexperience as a public speaker, and concludes, or begins, by declaring that his predecessor's words were so luminous, his arguments so convincing, and views so comprehensive, as to have left him little to add. If there be no opposition—as is generally the case now-a-days, when a prime minister plumes himself on his dexterity in framing a royal speech with which no fault can be found, because there is nothing decisive expressed—a leading member on the opposite benches gets up; 'just hints a fault, and hesitates dislike,' insinuates how much more satisfactory to the country would have been a royal speech from his own party; sits down; and after a few words from a principal minister, expressing how delighted he is, and how much more so her majesty must be, with their wonderful unanimity, the address is voted *nem. con.*

But if a debate take place, a different scene ensues, and the house presents a much more animated appearance. So soon as the noble mover and seconder of the address have sat down, the leader of the opposition gets up, and attacks the whole with an energy which could not be surpassed if the existence of the country, instead of his own chance of office, depended on the issue. Fast and furious the words flow: he may not speak very distinctly or grammatically, but what he wants in logic and language, he makes up in copiousness and vehemence; and you would suppose that he was to conclude by an earnest address to her majesty, craving her instantly to send the obnoxious ministry to Tower-hill. The minister on the opposite side rises with a look of unblenched boldness, and before he resumes his seat, he proves, satisfactorily to his own party at least, that the country is in a miraculous state of prosperity under his government, and that his opponents alone ought to have been impeached. Another member from the opposition benches rises; picks fresh holes, and finds new faults: an orator from the ministerial ranks succeeds him; and thus they go on abusing the wares of each other like rival blacking-makers; till, by and by, when argument and vituperation appear exhausted, the matter comes to a stop; and the bold minister, producing from his pocket

the prodies of a hundred absent senators, whose intuitive wisdom enables them most unerringly to decide the merits of the debate without hearing it, settles the whole by a most satisfactory majority.

FALSE CRITICISM BY TRUE POETS.

THAT good poets are sometimes bad judges of excellence in their own art, may seem at first thought an untenable position, but it can easily be maintained by a reference to the history of literature. Jealousy, envy, self-conceit, an exclusive cultivation of some particular department of his art, or a strong idiosyncrasy of mind, or some early association, may as easily occasion an obliquity of judgment in the poet as in the mechanic. An author has an open or secret bias towards that branch of composition which he has most practised himself, and in which he is conscious that he best succeeds. This feeling too often influences his judgment upon the works of writers whose style and subject are essentially different from his own. To support his preferences, he invents or adopts certain theories or canons that would confine all literary merit within the narrow limits of his own sect or school. It is thus that the natural brotherhood of poets has been divided into innumerable parties, who regard each other with avowed hostility and contempt. They are blinded to all excellence that is not in some degree akin to their own.

In support of the foregoing remarks, I shall proceed to notice some of the most glaring mistakes of poetical critics.

One of the most celebrated of the poet-critics of modern times was Dr Samuel Johnson, who displayed extraordinary sagacity and acuteness in analysing the merits of the kind of poetry that was most allied to his own, but who could never pass beyond that limit with any degree of safety or success. Speaking entirely from his own feelings, he closes his review of *Paradise Lost* with the Gothic assertion, that its perusal is a duty rather than a pleasure. Of the *Lycidas*, which is so full of rich and varied melodies, he was of opinion that the diction was harsh and the numbers unpleasant. He once told Anna Seward that 'he would hang a dog that read that poem twice.' Of Collins, Johnson's unfavourable judgment is well known. With all his partiality and tenderness for the man, he had no feeling for the poet. He thought his poetry was not without some degree of merit, but confessed that he found it unattractive. 'As men,' said he, 'are often esteemed who cannot be loved, so the poetry of Collins may sometimes extort praise when it gives little pleasure;' and this is said of the finest ode-writer in the language—one of the most poetical of poets. The author of the *Ode to Evening*—a poem that floats into the reader's mind like a stream of celestial music—is pronounced harsh and prosaic in his diction. The high tone of Gray's lyric muse, and his exquisite versification, were lost upon the patron of Blackmore, Wattle, Pomfret, and Yalden.* When some one spoke to him of Chatterton, he exclaimed indignantly, 'Talk not to me of the powers of a vulgar uneducated stripling.' What would he have said of Burns?

Dr Johnson was one of the best of the commentators upon Shakspeare, and yet this is saying little in his favour—'bad is the best.' His remarks and explanations are generally sensible and clear, and his preface to Shakspeare's plays is a noble piece of writing; but he never seems to enter thoroughly into the soul of that mighty poet. He could explain an obscure passage more readily than he could feel a fine one. Pope, also, was rather too much of a town wit and fashionable satirist to enjoy and appreciate the great poet of universal nature—

* Who was not for an age, but for all time.'

* The poets in Dr Johnson's collection were all selected by the bookseller, with the exception of Blackmore, Wattle, Pomfret, and Yalden, who obtained admittance on the special recommendation of the doctor, as he himself tells us in his *Life of Dr Wattle*. Spenser and Shakspeare were excluded!

His edition of the prince of dramatic poets has fallen into deserved oblivion. He did not even understand or admire the more artificial, but yet manly and vigorous Ben Jonson. Spence tells us that Pope thought the greater part of that dramatist's productions 'poor trash.'

But 'rare Ben' himself, though a good poet, was a bad critic. He said of Spenser, that 'his stanzas pleased him not, nor his manner,' and that 'for some things, he esteemed Donne the first poet in the world.' Shakspeare, he thought, 'wanted art, and sometimes sense,' and why? because he made a blunder in geography. In the *Winter's Tale* he made Bohemia a maritime country, little dreaming that an error of locality would deduct from the miraculous truth of his delineations of the human heart.

The melodious Waller saw nothing in Milton but an old blind schoolmaster, who had written a dull poem, remarkable for nothing but its length; and Milton himself preferred the glittering conceits of Cowley to the manly energy and truth of Dryden, whom he pronounced a good rhymist, but no poet. But Dryden, also, with all his real merit as a poet, was a critic whose decisions are never to be relied on, partly because he was prejudiced, partly because he was, comparatively speaking, deficient in imagination and sensibility, and partly because he was a most unblushing adulator. He thought 'the matchless Orinda,' Catherine Philips, was a great poetess. He pronounced the versification of Spenser inferior to that of Waller. Voltaire, as every Englishman remembers, has spoken of Shakspeare's 'monstrous farces called tragedies,' and wondered that a nation which had produced *Cato* (Addison's collection of cold and stilted dialogues in the dramatic form), should tolerate such plays as *Lear*, *Hamlet*, *Macbeth*, and *Othello*! But if Voltaire has done British genius a gross injustice, he has suffered something in return. Gray declared that Voltaire (except as a writer of plays) was entirely without genius. Neither could he perceive any talent whatever in Rousseau's *Nouvelle Heloise*. He spoke in a similar strain of several British authors. He said that David Hume had continued all his days an infant, but had, unhappily, been taught to read and write. He saw no merit in Thomson's exquisite *Castle of Indolence*; and he thought Collins deficient in imagery! 'He (Collins) deserves,' said he, 'to live some years, but will not.' It would seem that the time has long gone by, when

'The sacred name
Of poet and of prophet was the same.'

Gray, in his verses to the artist who embellished an edition of his poems, very oddly inverts the merits of Pope and Dryden; by speaking of the energy of the first, and the melody of the second.

To the list of bad critics, I am compelled to add the name of Collins, for he has ventured to assert, in his Epistle to Sir Thomas Hanmer, that Fletcher excelled Shakspeare in the illustration of female tenderness.

'His every strain the smiles and graces own,
But stronger Shakspeare felt for man alone.'

It would be a waste of words to expose this egregious error, though I believe Collins only echoes Dryden. Gifford, in his edition of Massinger, almost repeats them both. He contends that Fletcher is at least as pathetic as Shakspeare. The pathos of *Lear* does not seem to have touched the author of the *Baviad* and *Maviad*, a coarse and savage satire, in which helpless women are insulted, and 'butterflies are broken on a wheel.' But in Gifford's estimation, not only is Fletcher at least Shakspeare's equal in pathos, but Beaumont is as sublime, Ben Jonson as nervous, and Massinger superior in rhetorical modulation. The sole point of unrivalled excellence that he leaves to Shakspeare is his wit!—and yet Gifford was for many years one of our leading critics. We ought not to be surprised that he pronounced Hazlitt a dull-headed blockhead; and that he could discover neither genius nor common sense in Keats

and Shelley. According to Gifford, 'the predominating character of Mr Shelley's poetry is its frequent and total want of meaning.' 'It is not too much to affirm,' he says (in speaking of the Prometheus, &c.), 'that in the whole volume there is not one original image of nature, one simple expression of human feeling, or one new association of the appearances of the moral with those of the material world.'

Anna Seward, a poetess of some note in her time, and still spoken of with respect by Southey, ranked Darwin and Hayley amongst the greatest of our bards. Of the former she thus writes:—'He knew that his verse would live to distant ages; but he also knew that it would survive by the slowly accumulating suffrages of kindred genius when contemporary jealousy had ceased to operate.' How vainly did the poet lay this flattering unction to his soul, and how completely was Anna Seward mistaken in all her sympathetic anticipations of her friend's future fame! Of the feeble and half-forgotten Hayley, she speaks with even greater warmth, and in a style of prophecy which the lapses of a very few years has rendered absolutely ludicrous. 'Hayley is indeed a true poet. He has the fire and energy of Dryden without his absurdity (!), and he has the wit and ease of Prior (!). His beautiful *Epistles on Painting*—far even above these, his *Essay on Epic Poetry*, together with the fine *Ode to Howard*, will be considered as amongst the first Delphic ornaments of the eighteenth century.' But even Cowper thought highly of Hayley and Darwin; and Miss Seward was not a worse critic than the 'true poet,' whose productions are 'amongst the first Delphic ornaments of the eighteenth century.' In one of Hayley's letters to her, in alluding to Burns, he compares him to some obscure and humble versifier who had gained her patronage. 'I admire the Scottish peasant,' says he, 'but I do not think him superior to your poetical carpenter!'

Burns himself had a most extravagant opinion of Fergusson as a poet, whom he preferred to Allan Ramsay. Thomas Warton, though a great admirer of Milton's genius, thought nature had not blessed the divine old bard with an ear for verse. Akenside, who, observes Johnson, upon a poetical question, has a right to be heard, said that 'he would regulate his opinion of the reigning taste by the fate of Dyer's *Fleece*; for if that were ill received, he should not think it any longer reasonable to expect fame from excellence.' The prophecy of some wit, in allusion to this poem, that Dyer would be buried in his own wool, would have been fulfilled almost to the letter, if it were not for his *Grongar Hill*, on which he still breathes the vital air. Scott of Amwell, the Quaker poet, made a desperate attempt to rescue the *Fleece* from oblivion, and vainly endeavoured to persuade the public that it is much superior to the *Grongar Hill*.

Addison, who has been so much praised for his critique on Milton, was, after all, but another example of the fallibility of poetical critics. In his versified 'Account of the greatest English Poets,' he omits all allusion to Shakspeare, but praises Roscommon as 'the best of critics and of poets too!' After having taken due notice of numerous 'great' poets, he recollects that 'justice demands one labour more'—

'The noble Montague remains unnamed.'

That Shakspeare was unnamed, was of little consequence! But though the critic and poet was, as he elegantly expresses himself,

'Tired with rhyming, and would fain give o'er,'

he would have deemed himself highly blameworthy had he omitted Montague! His list of great poets would have been deplorably incomplete! Though he is so enraptured with Montague, he says little in favour of Chaucer or Spenser. Of the former he observes,

'In vain he jeets in his unpolished strain;'

and of the latter he tells us, that though his tales

'amused a barbarous age' (the age of Shakspeare, Bacon, Jeremy Taylor, Beaumont and Fletcher, &c. &c.),

'An age as yet uncultivate and rude,'

that he is no longer to be tolerated—

'But now the mystic tale that charmed of yore
Can charm an understanding age no more.'

Amongst the poets of the nineteenth century, we have a melancholy display of bad critics upon productions in their own art. Byron called Spenser 'a dull fellow,' and said, 'he could see nothing in him.'* He considered that Chaucer was 'contemptible,' and owed his celebrity merely to his antiquity, and that he was inferior to Pierce Plowman and Thomas of Ercildoune. He placed Rogers at the head of all his contemporaries, and looked, or pretended to look, with supreme scorn upon Southey and Wordsworth. He thus spoke of the most ambitious of the latter's undertakings:—

'A clumsy, frowy poem called the *Excursion*,
Writ in a manner that is my aversion.'

He said Cowper was 'no poet,' and intimated that Pope was at least equal if not superior to Shakspeare, for whom he had no very passionate admiration. He thought the author of the *Essay on Man* was the greatest of poets, because the science of morals is the greatest of all subjects; though he contradicted himself by an equally foolish position, that a poet ranks by his execution alone, and not by the nature of his subject or undertaking; so that the author of a good epigram must be equal in rank to the author of a good epic, which Dryden calls the greatest work of which the mind of man is capable. Young's *Revenge* was Byron's favourite play, though he had read *Othello*.

Wordsworth calls Dryden's celebrated music ode 'a drunken song,' and professes to entertain a profound contempt for some of the finest poetry of Burns. The celebrated Dr Wolcott (Peter Pindar) used to speak in the same style of Dryden's ode. 'How wofully,' he would often exclaim, 'have mankind been mistaken in their admiration of this paltry production!' Mrs Hemans, in one of her letters (published in Chorley's *Memoirs* of her), records the following very remarkable conversation between herself and the great poet of the lakes:—'We were sitting on a bank (she writes) overlooking Rydal Lake, and speaking of Burns. I said, "Mr Wordsworth, do you not think his war ode, "Scots wha hae wi' Wallace bled," has been a good deal overrated, especially by Mr Carlyle, who calls it the noblest lyric in the language?" "I am delighted to hear you ask the question," was his reply; "overrated?—trash!—miserable inanity! without a thought—without an image!" &c. &c. Then he recited the piece in a tone of unutterable scorn, and concluded with a *da capo* of "wretched stuff!"'

Wordsworth and Coleridge see no beauty in Gray's *Elegy*, though the latter had the most extravagantly favourable opinion of the sentimental poetry of Bowles, and praises it for its 'manliest melancholy.' Keats styled all the poets of the Frenchified English school 'a school of dolts.'

'Ye taught a school
Of dolts that smooth, tinsel, and clip and fit,
Till, like the certain wands of Jacob's wit,
Their verses tallied. Easy was the task.'

Perhaps Keats would not have found the composition of other *Rape of the Lock* quite so easy a task as he

* If Byron ever read Gabriel Harvey's letter to Spenser, in which he discourages him from proceeding with the *Fairy Queen*, he must have been delighted with such congeniality of taste. Harvey was a man of great learning and elegant accomplishments, and wrote verses which were well thought of by Spenser himself and other good judges of poetical merit. Spenser sent Harvey a specimen of the *Fairy Queen* for his opinion, and his 'most special friend' returned it with a prayer that 'God or some good angel would put him in a better mind.' This condemnation of Spenser's noblest work is accompanied with high praises of some of his inferior productions.

imagined. There is even in the *Essay on Man*, and the *Prologue to Cato*, something more than

'A puling infant's force,
That swayed about upon a rocking-horse,
And thought it Pegasus.'

Sir Walter Scott, though he exhibited a noble impartiality and a rare self-insight when speaking of his own poems, was not a first-rate judge of the poetry of other men. 'He often said to me,' says his friend Ballantyne, 'that neither his own nor any modern popular style of composition, was that from which he derived most pleasure. I asked him what it was; he answered'—(what does the reader suppose? Shakspeare's, Spenser's, Milton's, Dryden's, Pope's, Burns's? Oh no!)—'Dr Johnson's (!), and that he had more pleasure in reading *London*, and *The Vanity of Human Wishes*, than any other poetical composition he could mention.' Scott, however, is the only poet I have read of who judged fairly and yet unfavourably of his own poetical compositions. He always said that they could never live; and were not to be compared with the works of many of his contemporaries. In the meridian of his own poetical popularity, he felt that those comparatively neglected writers, Wordsworth, Coleridge, and Shelley, were far greater poets, and more deeply touched with the holy fire of inspiration. Nor did Scott ever prefer his worst pieces to his best. In this respect he exhibited a far clearer judgment than many other celebrated authors. Petrarch doted on his *Africa*, Milton on his *Paradise Regained*, Prior on his *Solomon*, and Byron on his *Hints from Horace*.

I have now, I think, sufficiently established my position, that good poets are not always good critics, and that we ought not to trust too implicitly to their authority on a question of poetical criticism.*

INFLUENCE OF AIR AND EXERCISE ON HEALTH.

In proof of the influence which even temporary physical education exerts upon the human frame and its stamina, may be mentioned the following example:—In the summer of 1839, we had an opportunity of witnessing one of the trial races of Osceola, at that time one of the swiftest runners in England. On the occasion we speak of, he ran 120 yards in eleven seconds; his pulse, just before starting, beat 61 strokes per minute, and at the termination of his extraordinary feat it beat only 94! When it is further taken into account, that, whilst in the act of running, he never made a complete inspiration or expiration, the performance can be considered little short of wonderful. We were informed by the man himself, that though he was naturally remarkable for nimble-footedness, he was anything but 'good-winded.' Two months previously, he had been taken from a stocking-frame, and, by a process of merely careful training, was brought into the state of bodily condition alluded to. Had it been possible for him, before commencing to train, to have run the distance in the time stated, the effort, if it had not killed, would have nearly asphyxiated him. He would have been breathing for his life, and his pulse could not have been counted. As it was, at the completion of his task he breathed without difficulty, and his pulse was increased only 33 beats per minute! After such evidence as this, and it is only one of a multitude of examples with which the world is familiar, no man, not actually diseased, need despair of becoming active and vigorous, if he will only attend to the simple rules which are to guide his physical discipline. The man of whom we have spoken had not a good chest, for which reason he could not, under any circumstances, have run a long race; and his configuration of thorax was even opposed to an effort of speed for a short distance; but the natural obstacle was overcome for the time being by temporary training! We are, perhaps, not justified in saying *ex uno disce omnes*; but at least we can say, that if two short months of rigid living, and exercise in pure air, can do so much for a man's constitution and strength, how much more permanent service may be done by a continued observance, though in

* The above is presented, with the concurrence of the author, as the spirit of a paper in the 'Literary Leaves' of David Laeter Richardson.

a milder degree, of the principles we have laid down. How many listless and enfeebled frames would be roused, refreshed, and made fit for the wear and tear of a protracted life! How many minds, sinking into imbecility from actual lassitude, or oppressed by the melancholy of fancied cares, would be stirred by the busy and cheerful objects of worldly enterprise! We would fain teach the man too ardently devoted to learning, to science, or to worldly business, that with all his toil, and care, and penury of time, he is not a gainer; he may appropriate to his idol object an hour that should be sacred to his own service, and in so doing he is a loser of twain; let him husband his moments as niggardly as he will, there is a certain reckoning which he must daily have with himself, a certain time for his own rest and refreshment; and if that time be not granted, it becomes no matter of idle debtorship—day after day registers a fresh account against him, and, at the end of a few years, the unsuspected fact of premature old age is announced by decrepitude, decay, and death.—*Medical Times*.

QUEEN ELIZABETH'S LAST ILLNESS.

The Archbishop of Canterbury and Cecil intreated her to receive medical aid; but she angrily told them, 'that she knew her own constitution better than they did, and that she was not in so much danger as they imagined.' The admiral came and knelt beside her, where she sat among her cushions, sullen and unresigned; he kissed her hands, and, with tears, implored her to take a little nourishment. After much ado, he prevailed so far, that she received a little broth from his hands, he feeding her with a spoon. But when he urged her to go to bed, she angrily refused, and then, in wild and wandering words, hinted of phantasms that had troubled her midnight couch. 'If he were in the habit of seeing such things in his bed,' she said, 'as she did when in hers, he would not persuade her to go there.' Secretary Cecil overhearing this speech, asked 'if her majesty had seen any spirits?' A flash of Elizabeth's mighty mind for an instant triumphed over the wreck of her bodily and mental faculties; she knew the man, and was aware he had been trucking with her successor. He was not in her confidence, and she answered majestically, 'she scorned to answer him such a question!' But Cecil's pertness was not subdued by the lion-like mien of dying majesty, and he told her that, 'to content the people, she must go to bed.' At which she smiled, wonderfully contemning to him, observing, 'the word must was not to be used to princes'; adding, 'Little man, little man, if your father had lived, ye durst not have said so much; but ye know I must die, and that makes ye so presumptuous.' She then commanded him and the rest to depart out of her chamber, all but Lord Admiral Howard, to whom, as her near relation and fast friend through life, she was confidential to the last, even regarding those unreal phantasms, which, when her great mind awoke for a moment, it is plain she referred to their proper causes. When Cecil and his colleagues were gone, the queen, shaking her head piteously, said to her brave kinsman, 'My lord, I am tied with a chain of iron about my neck.' The lord admiral reminded her of her wonted courage; but she replied despondingly, 'I am tied, I am tied, and the case is altered with me.' The queen understood that Secretary Cecil had given forth to the people that she was mad; therefore, in her sickness, she did many times say unto him, 'Cecil, I am not mad; you must not think to make Queen Jane of me.' She evidently alluded to the unfortunate queen-regnant of Castille, the mad Joanna, mother of Charles V., whose sad life, as a regal maniac, was fresh in the memory of her dying contemporary.—*Agnes Strickland's Lives of the Queens of England*.

PERIODICAL PUBLISHED IN A LUNATIC ASYLUM.

What a strange contrast does the following statement, by the New York Journal of Medicine, present to the state of things formerly existing in similar establishments! 'It is in the Vermont Asylum that the literary spirit has been carried even to the *acrotiches scribendi*; for, not content with the enjoyment of being merely readers, they actually publish a small newspaper called the "Asylum Journal." As they thus receive in exchange more than two hundred newspapers, besides many other periodicals, the superintendent is enabled to furnish every patient with a newspaper from his own immediate neighbourhood, at the same time that every politician has one of his own political views, and every sectarian one adapted to his own religious senti-

ments.' We see it also stated by some of the medical journals of our own country, that very successful results have attended a similar undertaking in the Crichton Asylum, Dumfriesshire.

TO A BUTTERFLY IN THE CITY.

[BY S. W. PARTRIDGE.]

FEEBLE flutterer, timid thing,
Wherefore here with trembling wing?
Crowded streets can never be,
Foolish rambler, fit for thee.
Art thou tired of leafy bowers,
Sunny streams, and honied flowers;
Is the rose, thy perfumed bed,
Tempest-snapped, untimely dead;
Or, still worse, thy love unkind,
That thou leav'st the fields behind,
Here unwisely come to roam
Far from beauty, peace, and home?

Or, by travelled friend impressed,
Art thou come with curious breast?
Wouldst thou see the domes and towers
In this crowded coop of ours?
Or survey, with eager eyes,
Creatures so divinely wise?
Fly, ah! fly these swarming efforts,
Seek again thy green retreats;
For, though wonders here you see,
Joy and quiet dwell with thee.

But with kinder aim, no doubt,
Thou hast come to seek us out;
Thou didst fear, so hard we mofl
In the dust of care and toil,
We might be all out of tune
For the flowery joys of June,
And, with ledger-blinded eye,
Let unseen its beauties die.
Ah! thy fear was wise; we strive,
Tugging in this human hive,
Too intent on gains and losses
In life's game of 'noughts and crosses';
While fair nature's volume lies
All unread before our eyes,
Densified in our every sense
To her holy influence.

But return; afar from men
Seek thy sunny haunts again,
And we too, ere long, will come
To thy quiet leafy home.
There we'll seek the thyme-bank sunny
Where the flower-thief pilfers honey,
There we'll rove with dance and song
Where the carp darts swift along,
Or beneath some honied lime
Leaf-embowered, laugh at time.
Thus the happy hours shall be
Fraught with love and liberty;
Thus thy home and joys we'll share,
Far from toil, and noise, and care.

NOTE.

In the article entitled *Railway Literature*, published on the 22d March (No. 64, New Series), an omission appears to have been made with respect to the share which the Scotsman (Edinburgh newspaper) had in promoting the trial of a high rate of speed upon railways. The same omission, it may be remarked, occurs in an article on railways in the Quarterly Review for June 1844 (p. 233). We now learn from an article in the Scotsman, that the editor of that paper, having engaged in researches into the laws of friction established by Vince and Coulomb, published the results in a series of articles in his journal in 1834, showing how twenty miles an hour was, on theoretic grounds, within the limits of possibility; and it was to his writings on this point, and not to anything that had fallen from Mr George Stephenson, that Mr Nicolas Wood alluded when he spoke of the 'ridiculous expectation' that engines would ever travel at the rate of twenty or even twelve miles an hour.

*. Complete sets of the Journal, First Series, in twelve volumes, and also old numbers to complete sets, may be had from the publishers or their agents. A Stamped Edition issued for transmission, post free, price Two-pence halfpenny.

Printed by William Bradbury, of No. 6, York Place, and Frederick Mallett Evans, of No. 7, Church Street, both of Scotch Newington, in the county of Middlesex, printers at their office, Lombard Street, in the precinct of Whitefriars, and city of London; and Published (with permission of the Proprietors, W. and R. O. A. MERRIS,) by WILLIAM SOMERVILLE ORR, Publisher, of S. Anne's Corner, at No. 2, A MERRIS CORNER, both in the parish of Chancery, and in the city of London.—*Edinburgh*, May 31, 1846.

THE ELECTRIC TELEGRAPH.

It would be difficult, amidst the numerous inventions which have of late been brought before the public for its social benefit, to select one more curious and extraordinary than the electric telegraph. The simple fact that means are now provided for the transmission of intelligence over hundreds of miles in nearly as short a time as it takes to speak to a companion with whom one is face to face, opens out a perspective view of future conveniences almost bewildering. What has already been accomplished by the electric telegraph shows the possibility of rapid communication between 'the uttermost ends of the earth.' By means of a set of electric wires, extending between London and Pekin, the privy council of St James's and the *Loo-poo* board of the Celestial emperor might without any imaginable difficulty effect an hourly exchange of official sentiments, and settle the whole details of an important treaty in the course of a forenoon!

To demonstrate this wondrous possibility, it will be only necessary to record what we ourselves witnessed at the terminus of the South Western Railway during a visit to London last month. It happened that a gentleman of our acquaintance had organised a game of chess, one of the players being stationed at the London and the other at the Gosport terminus of the railway; the moves of each to be communicated to and fro by the electric telegraph. This curious application of electricity we were politely invited to witness.

On reaching the terminus, which is situated at Vaux-hall, we were ushered into the committee-room, where we observed the London player surrounded by numerous chess-advisers, with whom he was discussing the propriety of certain moves that had just been proposed. When an effective one was decided on, it was recorded on a small slip of paper, and handed to the gentleman who worked the telegraph, which stood in an ante-room. The machine was set in motion, and in the course of a very few minutes it had not only been received at Gosport, but the return or counter-move decided on by the antagonist eighty-eight miles off was indicated on the index of the telegraph on the table before us! The curiosity we had previously felt to see the wonderful machine at work was now strongly excited to learn how its magical powers operated. Fortunately Mr Cooke the inventor, who, with the assistance of Professor Wheatstone, has brought the instrument to its high condition of usefulness, was in the room, and readily explained to us not only the nature but the origin and progress of the invention.

Mr Cooke, by profession a military man, having served in our Indian armies several years, was, in March 1836, engaged at Heidelberg in anatomical researches, chiefly for the purpose of modelling his own dissections from

nature for the embellishment of his father's museum, a professor of the Durham university. In this self-taught art he had been engaged many months, when an entirely new direction was accidentally given to his thoughts. Professor Moencke of Heidelberg had invited Mr Cooke to witness some experiments with a simple apparatus intended to illustrate the possibility of giving signals by electricity—an idea which had already occupied the scientific world for several years. So powerful was the impression produced on Mr Cooke's mind by these experiments, and so convinced was he of the possibility of applying electricity to the transmission of telegraphic intelligence along railway lines, that, abandoning his other pursuits, he devoted himself from that hour exclusively to the realisation of the present telegraph. It is no slight proof of the energy and ingenuity of this gentleman, that, within three weeks of his first conceiving the idea, he had constructed at Frankfort two galvanometer telegraphs capable of giving twenty-six signals; he had also invented the *detector*, by which injuries to the wires, whether from water, fracture, or contact, were readily traced—an instrument which Mr Cooke still retains in constant use, and without which, indeed, an electric telegraph would be impracticable. Lastly, he invented the *alarm*, by which notice is given at one end of the telegraph that something is about to be communicated from the other. He returned to London about six weeks after, and engaged himself during the succeeding year in making a variety of instruments, and in efforts to introduce the use of his telegraph on the Liverpool and Manchester Railway. In February 1837, he made the acquaintance of Professor Wheatstone, a gentleman of high scientific attainments, who had been for years employed in endeavouring to transmit signals both by sounds and by electricity. Mr Cooke immediately secured the professor's co-operation, and the two gentlemen entered into partnership as proprietors of the patent under which the telegraph is worked.

Most of our readers need scarcely be told that the readiest mode of producing a current of electricity is by means of a battery invented by Mr Smee. This consists in its simplest form of two plates of zinc separated by a diaphragm of platinised silver, and immersed in a weak solution of sulphuric acid. During the action of the acid upon the zinc, electricity is copiously evolved, and may be conducted to any distance by means of attached wires. At the termination, the electric current may be made to communicate motion to some small object, such as a bell, or the hand of an index.

Such is the merest outline of the mode in which electric telegraphing is effected. Mr Cooke's contrivance requires of course further explanation. In the ante-room before mentioned, the most striking object we beheld was a kind of cabinet having all the appear-

ance of a handsome table clock. On a glass-covered metal plate in front, are two disks, each furnished with a needle moving on an extremely sensitive pivot, so as to point upwards and downwards. At the base of this clock-like machine are two handles by which the motion communicated to these needles by the electric current is directed. Exactly the same sort of machine stands at the Gosport terminus of the railway, and its needles move precisely in accordance with the motions of those we saw at work, so that the attendant at Gosport can read from the motion of the needles what the attendant at the London end intends to convey by the motion he gives to the Gosport needles by means of the London handles. The electricity, therefore, gives mere unmeaning motion to the needles at either end—the gentleman in charge of the instrument *directs* that motion, and by the different positions in which he puts the two needles, communicates such meaning to the motion as is perfectly intelligible to his companion at the other terminus. The code of signals thus established was partly explained to us:—The left hand needle when moved to the left gives E, to the right I; the other needle gives O and U; both pointing parallel, W or Y. The consonants most in use are given by two movements of the needle; and those very rarely required, such as J, Q, X, Z, by three movements. The word 'you,' for example, is expressed by both needles pointing parallel for Y; the right hand needle moving once to the left for O, and once to the right for U. A different set of oscillations are used for numerals. The gentlemen who direct this novel mode of communication do it so quickly, that all you see is the two needles shaking about and oscillating on their pivots with great rapidity. How the correspondent at the other end can follow such rapid signalling puzzles the uninitiated extremely; but Mr Cooke assured us that a young man, whom he pointed out, had been under instruction only three weeks, when, on going to the telegraph, he signalled so rapidly that the gentleman at the other end complained that his movements were far too electric, and that he could not follow him. Hoping to put the novice in a similar difficulty, he began signalling in return as fast as he—an experienced signaller—was able; but the tyro read off every word as fluently as from a book—so simple is the code when properly understood.

Having as yet only explained the principle of the signals, we must now follow Mr Cooke's explanation along the eighty-eight miles of wires. As before hinted, the contact of the zinc and silver with sulphuric acid produces a constant supply of electricity, and if the signal wires were always attached to the battery, a constant and unmeaning motion would be going on. When not in use, therefore, the telegraphic wire is detached. Hence there is a second wire to conduct the electricity into the earth (which it does by being simply attached to a lamp-post in the street) when the telegraph is not at work, and when consequently the working wire is permanently out of use. Some one is always in attendance before each dial, and when a signal is to be communicated, the wire is attached to the battery, and the electric fluid made to ring a small bell at the other end of the wire. This gives the proper warning. The communicant then signals the word 'Ready' to which the reply is 'Yes.' Whatever has to be said is then proceeded with 'as quick'—to use language now no longer metaphorical—'as lightning.'

The wires, which are the conductors of the electricity, are of iron, and rather thick (being what wire-drawers number 7 or 8), coated with zinc. The earliest wires Mr Cooke laid down were enclosed in tubes, and buried in the earth, as a protection against injury from weather; but this was a most expensive plan, and he tried the experiment of exposed wires. It succeeded completely; for by a singular operation of nature, which

has not yet been explained, the effect of the air and damp upon the electrified iron with its zinc coating has been to incrust it with a light-coloured pigment, which forms of itself an ample protection. Hence the wire is exposed all along the line; the mode by which it was fixed and joined being as follows:—At every 500 or 600 yards, strong posts of timber from 16 to 18 feet in height were fixed in the ground. Attached to the heads of these posts is a winding apparatus, and between every two of such posts, upright wooden standards are fixed about 60 or 70 yards apart. A ring of iron wire, which has been formed by welding the short lengths in which it is made together, is then placed upon a reel carried on a handbarrow, and one end being attached to the winder at one draw-post, the wire is extended to the adjoining draw-post, and there fixed to its corresponding winder; by turning the pin of the ratchet-wheel with a proper key, the wire is tightened to the necessary degree; thus the greatest accuracy may be attained in drawing the wires up. To sufficiently insulate the wires so suspended at the point of contact with the posts, is an object of indispensable importance, as the dampness of the wood during rainy weather would otherwise allow the electric fluid to pass off freely into the earth, without reaching the distant terminus at which the telegraphic effect is to be produced. In this, indeed, lies an important feature of Mr Cooke's invention, as the idea of merely supporting wires in the open air from poles, trees, or church steeples, is the oldest on record. To effect this object, at the draw-posts wooden boxes are employed to enclose that portion of the post to which the winders are attached, and small openings are left for the free passage of the wires, without risking any contact with the outer box. The wire, therefore, may be said to be continuous—in this instance for eighty-eight miles, or from London to Gosport. A separate wire and a separate telegraph are required for each station on the road. For six such wires the cost is about £149, 6s. per mile. On the South Western there are only two, one for Gosport and one for Southampton.

Having received this explanation, we again directed our attention to the chess-players, to ascertain by what means the parties made each other understand the moves. This was simple enough. Each piece and each square of the board was numbered, so by simply telegraphing, 'No. 1 to No. 9' for instance, it was easy to understand that the white rook was moved one square forward. It seems that the game was commenced about eleven o'clock in the morning, and terminated a little before seven in the evening; but would have been concluded earlier, had not much delay been occasioned at Gosport in transmitting the moves to Southampton, where a third party of chess-players had congregated to 'watch' the game. Despite this extra complication in the working of the telegraphs, one hundred and seventy moves were communicated without a single error. So equal was the play, that it turned out a 'drawn' game.

In conversations with gentlemen present, we gathered some interesting conjectures regarding the future usefulness of this extraordinary invention. First, it will convey orders and messages along the line according to the instructions of the directors and managers of the railway. Next, it is to serve the important use of communicating between the Admiralty in Whitehall and the naval establishment at Portsmouth. A similar communication is in contemplation with the arsenal at Plymouth. The South Wales line may also carry the telegraph to Milford, another of our dockyards; and when all the dockyards are thus telegraphically united with the Admiralty, orders will at any instant, with the quickness of thought, be transmitted to the great naval stations of the country from headquarters, and from each to any of the others, or information be returned from them to headquarters, with greater speed than they could formerly be carried from the great room of the Admiralty to the secretary in the adjoining apartment. The energy which, in cases of

emergency, this would infuse into every department of the service, must be of incalculable utility to the country. It is also intended to throw the use of the telegraph open to the public for a small fee. By making an appointment with a friend, you to be at the Vauxhall and he at the Gosport terminus at a particular moment, any news which it may be important for either party to know will be instantly communicated. Nor will it serve only for distances comparatively so short, but equally well for such as that between London and Edinburgh, or even Aberdeen, when the railway lines between these places are formed, as it is now certain they soon will be. Suppose a gentleman connected with our city is on a visit to London, and one of his family suddenly takes ill. It will be possible immediately to communicate the intelligence to the station at the latter city, where a messenger or a letter by the local post will accomplish the rest of the business in a brief space of time. In such a case, we shall suppose the gentleman, on receiving the intelligence, contemplates having immediately to return to his home, though the step is grievously inconvenient to him at the moment. In former circumstances, he might deem it necessary to set out instantly, because he could not be sure but that the object of his solicitude was by this time no more. Now, however, he may well wait with patience for the bulletin of next morning, when, applying at the railway station by appointment, he will learn that the patient, we shall say, has had a good night, and is considered out of danger. He returns with an easy mind to the city to attend to his business engagements, instead of having to set out on a long journey, the whole of which would have been spent in extreme, though it might ultimately prove useless anxiety. We had an opportunity, while in the Vauxhall station committee-room, of being impressed with a sense of the perfectly practical nature of this speculation. One of our friends wished to know from his partner, who was watching the game of chess at Gosport, if he intended returning to town to dine. The needles were set to work, and made to shake for a second or so; there was a short pause, and presently they gave some dozen oscillations, when the gentleman in the magnetic secret turned to us, and said that our friend's reply was 'Yes, at five.' All this was done in about the same space of time as would be occupied by one of our readers in perusing about half a column of this journal.

LUDOVICO LANA.

AN ANECDOTE OF MODERN SICILY.

In the summer of 1811, I was travelling in Sicily, and in crossing the island from Girgenti to Palermo, paid a visit to the town of Castrogiovanni, built on the site of the ancient Enna. After a ride of some hours under a scorching sun, and in a state which fully explained the nature of the metamorphosis which sundry nymphs of the classic ages underwent in the same lovely land, when by some powerful agency they melted away into fountains, it was with infinite satisfaction that I saw before me my destined resting-place.

Not a tree had I passed for hours which afforded as much shade as a cabbage-leaf—all was desolate and uncultivated; and the flowery plains in which Proserpine was gathering nosegays when Pluto acted so very like an unconstitutional king, and, in a manner which no gentleman out of the Emerald Isle would have dreamed of, forcibly abducted the daughter of Ceres; in these self-same meads, all was as brown and burnt up as a rabbit warren in the month of August. I could however calculate at least upon shelter from the sun, if the old town afforded nothing else, which is often the case in the interior of Sicily. But I had better hopes, for a friend at Girgenti had given

me letters to the Abbate Guttadouro, who would, I was assured, find me better quarters than any locanda could give; and that to the latter I could consign my servant and the mules.

Castrogiovanni stands upon a high isolated hill, and is surrounded by old walls and towers. The celebrated temple of Ceres stood, it is said, upon a similar hill, divided from that on which the town is built by the valley in which the abduction of the young lady aforesaid took place; but there are no more remains of the temple now left than there are traces of the chariot wheels by which she was borne away—the last remnants of the celebrated fane having been removed to build some of the old churches in the town. On entering the place—which seems to have retrograded in civilisation for the last two thousand years, till it has arrived at such a state as would be considered indictable by an English jury as dangerous to passengers, either biped or quadruped—I was surprised to see so little interest shown on the arrival of a stranger, as in most of these classic spots a host of mendicants assail him on one side, and guides on the other, each eager to catch fresh prey, and appropriate the spoils, whilst the idle and unemployed, who form at least nine-tenths of the population, and the hosts of the miserable locandas (the worst specimen of inn in the civilised world), swell the crowd; at Castrogiovanni affairs seemed quite in another state, and all appeared occupied in some weighty matter of general interest. The beggars forgot to hold out their hands, and the ciceroni to proffer the benefits of their local and classical erudition. We passed unnoticed through the street, and could scarcely bribe a half-naked urchin to guide us to the house of the abbate, to whom I had an introduction. When we arrived, the good priest was not to be found, but his housekeeper invited me to enter, and promised that my letter should be delivered immediately, as the abbate was readily to be found. Close at hand was the Cruce Blanco, one of the best locandas in the town, and thither I sent my servant with the mules, awaiting in patience the return of the master of the house, which was not long delayed. He was very kind, offering his house and all that he had with the accustomed Sicilian ceremonial, and it was arranged that I should become the guest of the abbate, whilst my servant remained at the inn for two or three days. I then learned the cause of the unusual excitement in the town. A brigand, belonging to it was said to the band of the celebrated Ludovico Lana, had been arrested, and it was expected that he would make disclosures of great interest when condemned to death, which it was decided that he should be by the judge and other authorities before the trial took place or a question was asked. He had been arrested on the deposition of a dying man, who had been robbed and mortally wounded on the road between Catania and Castrogiovanni; but the accused stoutly maintained that at the time mentioned he had been employed as a porter at Palermo. Unfortunately, he had neither time allowed nor the means of procuring the attendance of witnesses, and the judge had fully made up his mind before-hand, as is very generally the case, and the sentence was passed just at the time of my entering the town: all the world, therefore, were assembled about the tribunal, and employed in discussing the merits of the case, which accounted for the deserted state of the streets, never at any time crowded with population. Soon after my establishment with my host, my servant returned from the locanda, and congratulated me on my good quarters, more particularly as a very great per-

sonage had arrived a short time previous, and who occupied, together with the unfortunate man just condemned, all the thoughts of the innkeeper and his family. I inquired who the great unknown might be, and was told that he was a very fine-looking young man, about twenty-eight or thirty years of age, in the uniform of an English officer of rank, and attended by two domestics. He had arrived from Palermo; and though from his dress he appeared to be in the English service, yet his accent and dialect were evidently Maltese, which circumstance strongly excited the curiosity of the worthy landlord, whose house was seldom visited by persons of such distinction. The stranger had asked the distance from Castrogiovanni to Palermo, and was told about seventeen miles. He then ordered dinner, and desired his attendants to see to the horses, as he should proceed that evening to the place of his destination. The host ventured to represent to his excellenza the danger of the route, at which the traveller laughed, and asked in what the mighty danger consisted.

'Had his excellenza never heard of Ludovico Lana?' inquired the innkeeper.

'Ludovico Lana! and who may he be?' was the reply.

'Oh signior! the most terrible brigand in the island, and who just now will be more furious than ever.'

'And why so?'

'One of his band has just been arrested and condemned to death here, in Castrogiovanni; and Ludovico is capable of setting fire to the town, and cutting all our throats.'

The stranger laughed at the alarm of his informant, and asked when the execution would take place.

'The day after to-morrow, no doubt,' replied the host.

'And at what hour?'

'Eight in the morning, excellenza, is the usual hour.'

'I have a great curiosity to see the execution,' observed the officer.

'Nothing is easier; your excellenza can return hither from Palermo to-morrow evening, and I will take care to provide a good place for you to witness the execution of this bandit. I have the honour to be acquainted with the judge, and can, I doubt not, procure you a seat by him.'

'Just the thing,' replied the stranger. 'I will return to-morrow night, and in the meantime you will take care to make the proper arrangements.'

My servant then went on to narrate the wonder of the host when about to prepare the table for his guest, at learning from the servants that they carried with them various articles of plate and linen for their master's service, who was not accustomed to the rude furniture of a Sicilian locanda, and saw with amazement the preparations made for his accommodation. His curiosity being excited to the highest degree, he contrived to learn that the stranger was a Maltese, enormously rich, who had obtained a high rank in the English service, and was called Colonel Sancta Croce.

The colonel soon after started, as he had said, for the residence of his friend Prince Paterno, leaving one of his servants with part of his baggage at the locanda, purposing to return the next night to be in readiness to witness the execution. Meanwhile the host of the White Cross had informed not only his friend the judge, but all the town, of the great personage who had become his guest, detailing his magnificence with no little exaggeration, and easily obtaining a promise of the place he sought to witness the execution. During the whole of the intervening day the only subjects of discussion in the town were the arrival of this great person

at the White Cross, and the approaching event, many believing the assertions of innocence so stoutly maintained by the accused, from whom his confessor had obtained no avowal of guilt. The confessor himself seemed inclined to believe in the protestations of the condemned. At night another monk had an interview with him in the chapel where he was to pass the last hours of his existence, and remained with him till past eleven o'clock, declaring when he left him that he did not believe him to be guilty, and promising to pray for his deliverance. After this visitor had departed, the penitent seemed more tranquil and resigned than he had been at intervals during the day.

At midnight Colonel Sancta Croce arrived as he had promised at the locanda, and seemed perfectly satisfied with the arrangement he was informed his host had made for him to witness the spectacle of the next day. During the whole night the bells of all the churches and convents were tolled, to keep the good people of the town in mind of their duty to pray for the condemned; and at daybreak crowds began to assemble, and the peasantry to arrive from the neighbourhood. At seven o'clock the judge and other officials took their stations on a platform prepared for them, and were joined soon after by Colonel Sancta Croce, who was received with all the attention his wealth and rank demanded. At eight o'clock the bells again tolled forth, and announced the approach of the victim, who soon made his appearance mounted on an ass with his face towards the tail, preceded by the executioner, and surrounded by the Brothers of Mercy, whose especial duty it is to form a part on such melancholy occasions. The procession moved slowly along without any interruption, till it arrived opposite the spot where the authorities were seated, when suddenly the condemned gave a loud shout, and nodding with his head towards Colonel Sancta Croce (for his hands were tied behind his back), cried out to a monk who walked beside him, 'Father! father! there sits a gentleman who can save me if he will.'

'Where, my son?' asked the priest with no little amazement.

'There! there—by the judge, that officer in an English uniform—God has brought him here no doubt to save an innocent man—a miracle, father! a miracle!'

'A miracle! a miracle!' shouted the people who were near enough to catch the words; and 'a miracle! a miracle!' was repeated by the multitude as the word flew along their ranks. The executioner, however, seemed to have but little faith in the said miracle, and was proceeding to conduct the culprit to his fate, when the priest interfered, and advancing towards the judge, informed him that the condemned had recognised a gentleman near him whose evidence could clearly prove his innocence of the crime laid to his charge, and for which he was about to die, solemnly exhorting the magistrate to inquire into the affair.

'And who is this redoubtable witness?' asked the judge.

'The colonel!—Colonel Sancta Croce!' cried the poor culprit vehemently.

'Me!' exclaimed the colonel in amazement, 'me, my friend; you must be mistaken; and though you know my name, I have no knowledge of you whatever.'

'You have no knowledge of the man, colonel?' asked the magistrate.

'None, sir, on my word.'

'I thought so,' continued the judge; 'it is a mere excuse to delay the execution; at the same time making a sign to the executioner to proceed.'

'Oh colonel!' cried the unhappy wretch, 'do not send me thus to die when a word from you can save an innocent man; only let me ask you one question.'

'Hear him! hear him, colonel!' cried the mob; 'give him a fair hearing.'

'Signior,' said the colonel to the judge, 'common humanity, I think, requires us to attend to his prayer; if he is seeking to deceive, you will easily detect him; it is only a few moments' delay.'

'I will not refuse your excellenza,' said the judge; 'but I think it is scarcely worth the while to attend to him.'

'I ask the favour for my own satisfaction,' replied the officer.

The judge bowed and answered—'Be it as your excellenza pleases,' at the same time ordering the man to be brought near.

The poor fellow was as pale as death, and trembled violently.

'Now,' says the magistrate, 'ask your question; the colonel is kind enough to listen.'

'Excellenza,' said the condemned, addressing himself to the officer, 'you remember that you landed at Palermo from Malta on the 18th of last May?'

'I do not remember the precise day; but it was about that time,' replied the colonel.

'And does not your excellenza remember the porter who carried your luggage from the quay to the Hotel Inglese?'

'I certainly lodged in the Hotel Inglese, but have entirely forgotten the person of the porter who carried my luggage.'

'But you have not forgotten, signior colonel, that in passing along the Marino he was struck on the head by a bar of iron which a man was carrying on his shoulder, and very much cut?' at the same time thrusting forth his skull, and showing a wound not yet completely healed.

'You are right, perfectly right,' replied the colonel; 'I do remember the circumstance, now you recall it to my mind.'

'And your excellenza remembers,' exclaimed the culprit in a transport of joy, 'that, instead of the six carlini you promised me, you gave me two ounces?'

'All this is perfectly true,' answered the colonel in considerable surprise; and turning to the judge, he added—'if you will permit me, signior, I can verify these facts by turning to my book of memoranda?'

'Do so, colonel; do so,' replied the magistrate.

The colonel then produced a splendid pocket-book, and after turning over some of the pages, read aloud—'May the 18th—landed at Palermo at 11 A.M.; took a porter to carry my luggage, who was accidentally wounded in passing along the Marino. Lodged at the Hotel Inglese.'

'There, there!' exclaimed the prisoner in ecstasy; 'thanks be to the Holy Virgin.'

'In truth, sir,' continued the officer, turning to the magistrate, 'if the 18th of May be the day on which the crime is said to have been committed, I can bear witness that this man was in Palermo on that day, and could not have been on the road between Castrogiovanni and Catania, and must therefore be perfectly innocent.'

'Yes, yes! innocent, innocent!' cried the mob.

The judge, after some hesitation, ordered the man back to the prison.

'No, no,' exclaimed the multitude; 'set him free, set him free. He is not guilty, he is not guilty;' at the same time rushing forward, they seized him from the hands of his guards, and in an instant delivered him from the bands with which he was confined; whilst others, with a wonderful love of summary justice, began to assault the executioner with a volley of stones. The magistrate, knowing the frenzy of his countrymen, yielded without farther remonstrance; and the rescued prisoner was conveyed in triumph to the principal church to return thanks for his miraculous deliverance; after which ceremony he lost no time in taking his departure from the town, where he was seen no more. But the next day a letter was delivered to the judge by an unknown hand, and Ludovico Lana therein returned thanks to the authorities of the good town of Castrogiovanni for their great attention in giving him a place upon the platform, and listening to his evidence in favour of one of his band. The danger he had escaped, however, made such an impression upon the bandit,

that he sought, and through the intercession of his priest obtained, a pardon, underwent the penance enjoined him by the church, and became as honest a man as most of his countrymen.

VISIT TO A 'RAGGED SCHOOL'

'A RAGGED SCHOOL,' quoth the reader; 'pray, what kind of school is that?' A few words will suffice to answer this inquiry. A 'ragged school' is a Sunday school, established by private benevolence in a city district of the meanest kind, where every house is worn-out and crazy, and almost every tenant a beggar, or, perhaps, something worse. A school, moreover, in which no children are to be found who would be admitted into any other school; for, ragged, diseased, and crime-worn, their very appearance would scare away the children of well-conducted parents; and hence, if they were not educated there, they would receive no education at all.

In London there exist several 'ragged schools': one situated in the very heart of St Giles's; another—the one we propose to sketch—established nigh that worse than St Giles's, Field-Lane, Smithfield—the headquarters of thieves, coiners, burglars, and the other outcasts of society. This Sunday school was founded in 1841, and originated in the benevolent efforts of Mr Provan, a hero in humble life. After much exertion, especially in overcoming the objections of the parents, who considered the reformation of their offspring as the loss of so much capital, forty-five young persons, varying in age from six to eighteen, were induced to attend the school. At present, the average attendance on Sundays exceeds a hundred. The school is also opened three times a-week, when instruction of an ordinary kind is imparted gratuitously by a lady. Most—we might say all—of the fathers of the scholars belong to what may be called the predacious class, and the mothers fallen characters, who bear deep traces of guilt and disease in their countenances. Many of the children have been incarcerated for felony—educated thereto by their parents, as the trade whereby they are to live; and the destiny of all, unless better principles shall be implanted at school than can be acquired at home, is the hulks or Norfolk Island. All honour, then, to the brave men and women who have consecrated the day of rest to the god-like task of rescuing their fellow-creatures from a life of shame and misery—to change the ruffian into an honest man!

The Smithfield 'ragged school' is situate at 65 West Street, a locality where vice and fever hold fearful sway. To open it in any other neighbourhood, would be to defeat the object of the projectors. The very habiliments of the boys, so patched, that the character of the original texture could scarcely be gleaned, would almost be sufficient to preclude their ingress to a more respectable neighbourhood, and make them slink back abashed into their loathsome dens. It follows, that the object of the promoters of the 'ragged school'—the in-gathering of the outcast—requires that it should be held amidst the homes of these outcasts. The house has that battered, worn aspect, which speaks of dissolute idleness; the windows are dark and dingy, and the street too narrow to admit a current of fresh air; and it needed, on the rainy day in March in which it was visited, but a slightly active imagination to call up visions of the robberies and murders which have been planned in it, and of which it has been the scene.

The entrance to the school was dark; and there being no windows to illuminate the rickety staircase, we stumbled into the school-room on the first floor before we were aware. On entering, the eye was greeted by a spectacle to which, from its mingled humour and pathos, the pencil of Hogarth could have alone done justice. We found a group of from forty to fifty girls in one room, and about sixty boys in another: the girls, although the offspring of thieves, quiet, winning, and maidenly; but the boys full of grimace and antics, and, by jest and cunning glances, evincing that they thought the idea of

attending school fine fun. Foremost amongst them was a boy apparently aged seventeen, but as self-collected as a man of forty, of enormous head, and with a physiognomy in which cunning and wit were equally blended, whose mastery over the other boys was attested by their all addressing him as 'captain.' The boys had their wan, vice-worn faces as clean as could be expected, and their rags seemed furnished up for the occasion; whilst their ready repartee, and striking original remarks, and the electric light of the eye, when some peculiar practical joke was perpetrated, evinced that intellect was there, however uncultivated or misused. Unless we are greatly self-deceived, we beheld in this unpromising assemblage as good a show of heads as we have ever seen in any other Sunday school, and the remark is justified by what we learned with respect to the shrewdness generally evinced by these children. The predominant temperament was the sanguine, a constitution which usually indicates great love for animal exercise; and during the time we were present, they appeared as if they could not sit quiet one moment—hands, feet, head, nay, the very trunk itself, seemed perpetually struggling to do something, and that something generally being found in sheer mischief.

Hymns were occasionally sung to lively measures, the girls singing with a sweetness and pathos that sunk deep into the heart; but the boys were continually grimacing and joking, dovetailing into the hymns the rag-ends of popular songs, yet all the time attempting to look grave and sober, as if they were paying the most respectful attention. When the superintendent told the boys that he was about to pitch the tune, and that they must follow him, the boy before mentioned as the captain cried out, in a stage-whisper, 'Mr — says we are to follow him; I wonder where he's going to?' a jest hailed with a general laugh by his confederates. During teaching, questions of an unanswerable character were submitted by the boys to their master; for example, 'If you were starving and hungry, wouldn't you steal?' 'What is the use of hanging Tapping; will that convert him?' Various other attempts were made by the captain to puzzle the teacher, and failing, he was heard to say, 'That's no go—he is too deep for us.'

Amongst these boys, however, were some to whom the word of kindness was evidently a 'word in season,' and who drank in the tender accents with which they were addressed—perchance for the first time—as if it were music to their souls. Then, again, were to be seen some poor puny lad, as gentle in mind as in body, who was obviously dying from unfitness to cope with the requirements of his circumstances—poor tender saplings, growing in an atmosphere which was too bleak for any but the forest oak to brave. Untrained, except to crime, as most of the children are, much good has already been effected. Most of the scholars can read, and books have been supplied suited to their circumstances; and that the books are read with the understanding, is proved by the questions submitted to their teachers. Due honour to their parents has been taught. Many have thus become a comfort to homes to which they hitherto had been an additional curse; and many a mother, herself regenerated through the prattle of her child, has declared, with streaming eyes, 'I thank God my girl ever went to school!' Some of the scholars have been partially clad by the Dorcas Society connected with the school; and the stress which has been laid upon personal cleanliness has served to induce proper feelings of self-esteem; no slight ingredient in civilisation. Notwithstanding their many eccentricities, the children are really attached to their teachers; the girls coming forward from natural impulse, and with true politeness giving an affectionate 'Good-by, teacher,' even to the visitor; and the boys ever striving to please, in spite of their prevailing love of fun. One ouré but characteristic instance of this affection for their teachers may be noticed. A teacher, in passing through Field-Lane, was attracted by a pugilistic contest; when, on remonstrating with them on their folly,

one of the most brutal came up to him in a fighting attitude. Suddenly, a boy rushed through the crowd, and cried in stentorian tones, 'You leave him alone, Bill, or I'll knock you down; don't you know that's my teacher?' If, then, to win the affections be the best prelude to the reformation of the debased, again we say, honour to those brave men and women who, despite the contempt and the slander of the Pharisee and the worldling, have not shrunk from trying to rescue from ruin the neglected youthful soul!

Our sketch ends here; but the 'ragged school' was not visited for the mere gratification of curiosity, nor is that the motive which has induced us to describe the scene. A question entered our minds as we pondered over this visit, and a practical answer to which by our readers is the chief aim of the writer—'Why is there not a "ragged school" in every large town of Great Britain?'

MEXICO AS IT IS AND AS IT WAS.

FIRST ARTICLE.

THOSE who have travelled first through the United States, and afterwards through Mexico, cannot fail to be struck by the different results which Anglo-Saxon and Spanish colonisation has produced. Spain in every instance, from causes which it would require more space than we can now devote to the subject to explain, has been the means of degrading rather than of advancing the countries which conquest has brought beneath her sway. In nothing is the contrast between the races more remarkable than on the point of population. In 1753 that of the United States was 1,051,000; in 1810, 7,239,814; in 1840, 17,069,453. In 1793 the population of Mexico was 5,270,029, while in 1842 it had only advanced to 7,015,509. At this rate, the Union might reach to the rank of a thickly-peopled land in a hundred years; Mexico would take 1200 to attain the same result. The two countries also differ much on the score of education. In Mexico, less than 687,000 can read and write, while amongst her neighbours there are not 500,000 who cannot do so; in the United States are 173 universities or colleges, with 16,235 students; 3242 grammar schools, with 164,169 students; 47,309 primary common schools, with 1,845,244 scholars, of whom, at public charge, are 468,264. In Mexico, while 180,000 dollars were spent for hospitals, fortresses, and prisons, and 8,000,000 for the army, only 110,000 were devoted to education. Of late, however, the prospect is brightening; and in every one of the parishes into which the city of Mexico is divided, is a school for boys and one for girls, supported by the town-council, where children are taught without charge, books and stationery being also furnished gratis. A normal school and Lancasterian company are in operation with considerable success; as also is a night school for adults, fully attended by citizens whose avocations occupy them during the day. The private schools are chiefly kept by foreigners, who find it a profitable employment. The first effect of this reformation will be, to sweep away the *escuelaistas*, or letter-writers, who now, amid a population not three in a hundred of whom can write, drive a thriving trade. They may be seen, to the amount of about a dozen, on the curb stones of the eastern front of the Parian, near the Plaza. A huge jag of ink is placed before them; a board rests across their knees; a pile of different-coloured paper, cut valentine fashion, or adorned with pen and ink flourishes, is placed on it; and on a stool before them sits some disconsolate-looking damsel or heart-broken lover. As their principal customers are girls and youths, it is more than probable that love and

intrigue are their most ready themes: a 'declaration can be had for a rial, a scolding letter for a medio, and an upbraiding epistle' for a shilling. They are always bound to keep the secrets intrusted to them, and often indite epistles in relation to treason, assassination, and robbery.

There are two classes of clergy in the Mexican church—the rural clergy, who are notoriously the agents of charity and ministers of mercy, the advisers, friends, and protectors of their flocks, the defenders of the Indians, and the supporters of benevolent institutions, and consequently the poor clergy; then there are 2000 nuns, 1700 monks, and 3500 secular clergy, owning a property worth, at the lowest valuation, a hundred million of dollars, a sum capable of paying off the whole of the national debt. In a country where more than half the population is in a position beneath that of beggars, the following state of things appears out of place:—

'From the centre of the vast dome of Puebla de los Angeles depends the grand chandelier—a mass of gold and silver said to weigh *tons*. When this church was cleaned some years ago, the cost of purification alone was four thousand dollars. The altar affords the greatest display of Mexican marbles in the republic. The variety of colours is very great, among which is one of a pure and brilliant white, as transparent as alabaster. To the right of the altar is a figure of the Virgin Mary, nearly the size of life. Dressed in the richest embroidered satin, she displays strings of the largest pearls; round her brow is a crown of gold, inlaid with emeralds; her waist is bound with a zone of diamonds and enormous brilliants. The candelabras are of silver and gold, and so ponderous, that a strong man cannot move one. The Host is one mass of priceless and innumerable jewels.' In the cathedral of the city of Mexico is a rail of two hundred feet in length, four or five feet high, and of proportionable thickness, composed of gold, silver, and a small alloy of brass, and within it a figure of the virgin of Remedios, with three petticoats, one of pearls, one of emeralds, and the other of diamonds, worth three million of dollars. The church of Guadalupe is even richer; and at Loreto the last supper is represented by figures, before whom is a pile of silver and gold plate.

Beside this splendour the Mexican people stand in rags; their diet is poor, their lodging miserable, their clothing coarse, and inadequate for the climate; and you enter Mexico city over disjointed pavements, with the water green and putrid in the stagnant gutters, festering in the middle of streets swarmed by ragged thousands, looking, says Meyer in his late work on Mexico,* more like a population of witches freshly dismounted from their broomsticks than anything else. The house of a city leper—a term equivalent to Neapolitan lazzaroni—is a mere hovel of sun-burnt bricks, often worn by the weather to the shape of holes in the mud, and in the country are mostly built of split bamboos, set upright in the ground, with a steep roof thatched with palm leaves. The following from Meyer will give an idea of Mexican civilisation:—'Imagine a mud-hole surrounded by eight huts built of logs and reeds, stuck into the watery earth, and thatched with palm leaves. This was the stage breakfasting station on the road from Mexico to Cuernavaca. We asked for the house, and a hut a little more open than the rest was pointed out. It was in two divisions, one being closed with reeds, and the other entirely exposed, along one side of which was spread a rough board, supported

on four sticks covered with a dirty cloth. It was the principal hotel.'

The miserable hovels in which the Indians are lodged are far below a dog-kennel, they being stowed away under a roof of thatch, stuck in the bare ground, with a hole left at one end to crawl in. Even the better sort are only composed of a few canes and a thatch. The inhabitants of the hovels above-described are equally wretched with their dwellings. In fact, the idea we have given us of the poor population of the city of Mexico is perfectly frightful. Blackened in the sun, their hair long and tangled, ignorant of the use of water, brush, or towel, putting on a pair of leathern breeches at twenty, and wearing them without change until forty, with, over all, a torn and blackened hat, a tattered blanket begrimed with abominations, with wild eyes, shining teeth, and features pinched by hunger, with bare breasts and arms, and, if females, two or three miniatures trotting behind, and one strapped on the back, the lepero (from *lepra*, leper), though not suffering from the malady, hang about the markets and pulque shops, quarrelling, drinking, stealing, and lying drunk, with their children crying with hunger around them. At night they slink off to the suburbs, and coil themselves up in their damp unwholesome lairs.

These of course compose the very lowest dregs of the population. The city of Mexico has also its working-class and tradesmen. First the aquador, or water-carrier, with two earthen jars, one suspended by a leathern belt thrown round his forehead, and resting on his back, and the other suspended from the back of his head in front of him, preserving the equilibrium. Meyer relates an anecdote of one of these worthies, not over-creditable to one of the actors, as the result might have been serious. 'An Englishman passing an aquador in the street, struck the jar on the fellow's back with his cane; it broke, and the weight of the other jar brought the poor carrier on his nose. He rose in a rage, but was calmed by a couple of dollars. "I only wanted to see whether you were exactly balanced, my dear fellow, and the experiment is worth the money." Then there are pedlars, coffeehouse-keepers, old clothes, toys, and flower venders, sweetmeat makers, booksellers, and antiquity collectors; and, to return to the streets, the poor Indian may be seen with a huge coop of chickens and turkeys, or a pannier of oranges; then a woman with peas, or ducks, or fish, or potatoes; while another drives along a stunted ass. Most of the necessaries of life are supplied by hawkers. The beggars are a class too numerous to be overlooked. The city of Mexico swarms with them, and the capital usually employed is a sore leg, blindness, a decrepit father or mother, or a helpless child. One blind beggar, remarkably well dressed, was seen by Meyer to take up his place on a seat near the chief fountain of the Alameda every day at noon, attended by a couple of servants. A second had a burly porter to carry him, seated in a chair on his back. Many and many really miserable cases, however, throng the capital of the Montezumas.

The real Indian population even in the city of Mexico are superior to the leperos, especially those that ply their canoes between it and Chalco and Texcoco; and it is really a beautiful sight to behold their tiny vessels skim like floating gardens to the quays in the morning, and then in the afternoon the canals are covered with gay boat-loads of Indians passing homeward from market, dancing, singing, laughing, strumming the guitar, and crowned with wreaths of poppies. But, mixed in their races, degraded by the conquest, ground to the earth during the government of Spain, corrupted in spirit by an ignorant clergy, without education, lashed like wild beasts when recruits are wanted for the army, their fate is sad and dreary. In fact, though slavery is abolished by law, yet are they slaves in reality. Mr Stephens describes a scene which fully substantiates this assertion. 'Looking into the corridor, we saw a poor Indian on his knees on the pavement, with his

* London: Wiley and Putnam.

arms clasped round the knees of another Indian, so as to present his back fairly to the lash. At every blow he rose on one knee, and sent forth a piercing cry; but no sense of degradation crossed his mind. Indeed so humbled is this once fierce people, that they have a proverb—the Indians only bear through their backs.* They form, in fact, a degraded caste; are subjected to the control of masters and overseers; are ignorant, intemperate; and all because they are *bonâ fide* slaves. The site of an Indian village, however, is pointed out to the traveller about three leagues from the high road near Cuernavaca, the inhabitants of which are almost in their native state. They do not permit the visits of white people; and, numbering more than three thousand, come out in delegations to work at the haciendas, being governed at home by their own magistrates, administering their own laws, and employing a Catholic priest once a-year to shrive them of their sins. The money they receive in payment of wages at the haciendas is taken home and buried; and as they produce the cotton and skins for their dress, and the corn and beans for their food, they seldom purchase at the stores. They form a good and harmless community of people, rarely committing a depredation upon the neighbouring farmers, and only occasionally lassoing a cow, which they say they do not steal, but take for food. If they are chased on such occasions, so great is their speed of foot, that they are rarely caught even by the swiftest horses; and if their settlement is ever entered by a white, he is immediately seized and conveyed beyond the limits of the settlement.

The food of the Indians in the country is simple enough—a handful of corn, a bunch of plantains, or pan of beans from the nearest bushes; and a traveller will on his journey meet with sorry fare. Eggs, beans, and bread, mutton and fish stew, mingled with onions, lard, garlic and chilé peppers, served up without knife or fork, and rarely with a plate, by a dirty waiter, Lima beans, turkey and peppers, tomares (a mixture of meal, red pepper, and meat, wrapped in husks of corn, and boiled), are luxuries which, when the wayfarer happens upon, he should appreciate highly. In the city of Mexico, however, other matters are to be found. Ducks, about fifteenpence a pair, are abundant, the lake of Mexico being covered with them. About 200,000 of these birds are annually killed by a species of infernal machine with three tiers of barrels. A very amusing narrative of duck-shooting we extract from Meyer, as quite novel:—‘I was exceedingly surprised to find our guide waiting at his door, mounted on a bull! My first disposition was to laugh, but he prevented it by a smile, and a request to wait until we got among the *chichiquilotes*, and see what a sportsman his beast was. Tio is remarkable for his hunting strategy; and besides his bull (with which he hunts even in the mountains), he has invented a *pipe* that perfectly counterfeits the bleating of deer; and, by its sound, has often attracted a dozen round him while lying concealed in the forest. * * After wandering about for some time without starting game, Tio at last perceived a flock alight a hundred yards to the north of him. He dismounted immediately, waved his hand to us to remain quiet, crouched behind the bull, and, putting the animal in motion, both crept together till within gunshot. Here, by a twitch at his tail, the beast was stopped, and began munching the tasteless grass as eagerly as if gratifying a relishing appetite. Ignacio then slowly raised his head to a level with the bull's spine, and surveyed the field of battle, while the birds paddled about the fens unconscious of danger. Though within good shooting distance, Tio discovered that he had not a raking range; and, therefore, again dodging behind his rampart, put the bull in motion for the required spot. This attained, he levelled his gun and fired, honest Sancho never stirring his head from the grass! Several birds fell; while the rest of the flock, seeing nothing but an unbelligerent bull, flew about a dozen yards; and thus the conspiring beast and sports-

man sneaked along, from shot to shot, until nearly the whole flock was bagged!*

Beef in the city is about sixpence per pound, mutton a trifle more, ham five times as much, a turkey six shillings, potatoes sixpence a quart, bread threepence per pound, tea from six to nine shillings, coffee one, milk about the same as in London; but the great staple commodity is maize formed into tortilla cakes, which are made by soaking the grain in water with a little lime; when soft, the skin is peeled off, and then ground on a large block of stone. They then take some of the paste which ensues, and clap it between their hands, until they form it into light round cakes, which are afterwards toasted on a smooth plate called the *comal*, and ought to be eaten as hot as possible. Kendall, however, says they are tough, heavy, and unsavoury; ‘and most excellent bread do the Mexicans make—white, light, and sweet—and why they spoil their corn by converting it into tortillas, is a mystery.’ The sellers of these tough ‘buckakin’ victuals sit in lines along the curb of the side walks with their fresh cakes in baskets, covered with clean napkins to keep them warm; and as tortillas, with a little chilé boiled in lard, are indispensable twice a-day to the mass of the people, they have a ready sale. A few steps further on, another has a pan boiling over a portable furnace, and containing the required beans or chilé. The man squats down beside the seller, makes a breakfast or dinner-table of his knees, holds out his tortilla spread flat on his hand for a ladle of chilé, doubles up the edges of the cake, and so on until his appetite is satisfied. He who is better off owns a clay platter, into which he causes his frigoles, or chilé, or meat, to be thrown.

The national drink is pulque, which Meyer describes as like sour lemonade improved by the addition of cream of tartar; while Kendall, in his Santa Fé Expedition, says, ‘it had the flavour of stale small beer mixed with sour milk.’ The former, however, tasted some sent from Puebla, which was delicious. It is made from the *maquey aloe*, or *Agave Americana*. When the plant reaches seven years of age, it is usually ready to bloom. Upon the appearance of the first symptom of a bud, the centre stalk is cut out, and a bowl hollowed in the middle of the large leaves: into this for several days the juice of the plant exudes plentifully; and as the bowl fills at certain periods during the day, it is sucked into a long gourd by the Indian labourers, who transfer it from this to hog-skins. The outlay is calculated at about two dollars per plant, and the return from seven to ten. By distillation, a strong liquor is made from pulque, called *mescal*, the intoxicating influence of which tends much to the degradation of the lower classes in Mexico.

The dress of the lepero, and of the Indians, is the most scanty possible, being merely a few rags, and perhaps in the latter instance a thatch cloak of reeds; but the commonest woman of the middle classes has a fanciful petticoat and a reboso or shawl, which two articles constitute almost their whole costume. The costume and appearance, however, of some Indian girls near Jalapa must be striking. On their hair they bestow all their attention and care; two long braids fall from the back of the head, while two other braids, after circling the head twice, are fastened in front with a rose or some other flower. Their whole dress is a coarse woollen petticoat. Meyer once, however, knelt near a lady in church whose dress must have cost thousands. She wore a purple-velvet robe embroidered with white silk, white satin shoes, and silk stockings; a mantilla of the richest white blond lace fell over her head and shoulders, and her ears, neck, and fingers were one blaze of diamonds.

* A practice very similar existed, or still exists, in Scotland. Wild geese which in ordinary cases will not permit the sportsman to come within rifle reach of them, may be easily brought down by swan hall, if the individual take proper care to conceal himself between two bundles of straw on horseback, and then urge the horse in the direction in which the birds are feeding. Animals which seem to have an instinctive horror of man, have apparently little dread of any of their lowlier brethren.

A brief sketch of Mexico in the days of Cortes, and of the remaining characteristics of the people, must be reserved for another article. On both points the valuable work of Meyer gives ample details.

BIOGRAPHIC SKETCHES.

JOHN GOTTLIEB FICHTE.

EVERY one has heard of the so-called transcendental philosophy, which, from the time of its first promulgation by Immanuel Kant down to the present day, has exerted a powerful influence on the intellectual progress of Germany. In selecting for the subject of a biographical sketch one of its most distinguished teachers, we have not the slightest intention of giving any exposition of that profound metaphysical system. Fichte's career is in itself not devoid of interest, and we may perhaps gratify many of our readers by delineating the actual life of a German philosopher.

John Gottlieb Fichte was born at Rammenau, a hamlet of Saxony, on the 19th of May 1760. His family, though humble, had been long settled in his native place: its founder was a Swedish sergeant in the army with which Gustavus Adolphus invaded Germany. Having been dangerously wounded in some skirmish in the neighbourhood, this first of all the Fichtes was taken home, and carefully tended by a peasant of Rammenau. On his recovery, finding it impossible to rejoin his comrades, he remained with his benefactor, whose daughter he married, and on whose death he inherited a little copyhold, which is still in the possession of his descendants.

The father of the philosopher, besides cultivating his few roods of ground, was a weaver, and disposed of the ribbons, which were the chief produce of his loom, in Rammenau and its vicinity. Fichte was happy in his parents. Though poor, they were not uneducated, and both were of a religious, kindly, industrious disposition. Almost from his birth they learned to regard their little Gottlieb with peculiar feelings. A grand-uncle of the mother's, an aged and pious man, whose sayings were treasured up by his neighbours as of prophetic import, was present at the baptism, and when he knelt over the cradle to give his blessing, he declared that the infant would be the consolation and special joy of his parents. The death, immediately afterwards, of this venerated person, added weight to the prediction, and Fichte, as he grew up, was allowed more freedom than the other children, who had begun to follow him in quick succession. His parents hoped to see him, before they died, a clergyman, perhaps the clergyman of Rammenau itself. When the labours of the loom and the garden were at an end for the day, his father taught him to read. The child was active and earnest in doing all that was prescribed him, but of a tranquil and thoughtful nature. He loved to steal away from home, and ramble at will among the surrounding fields, and might be seen—his affectionate biographer and son assures us—for long periods 'standing and gazing steadfastly into the distance.' Sometimes, when his absence was protracted beyond sunset, one of the shepherds, who were accustomed to his strange solitary ways, would disturb his meditations, and conduct the tiny dreamer home. No man was less of a sentimentalist than the stern Fichte, yet in after-years he always looked back to those hours of early reverie as the fairest and happiest of his life.

He had reached his eighth year without having been sent to school, when a slight incident occurred which determined for ever his future career. Diendorf, the village pastor, made the boy, whose quiet ways he liked, come now and then to his house. On one occasion he happened to ask him if he remembered anything of the preceding Sunday's sermon, and was astonished to hear his own composition, fluently and pretty accurately repeated, flow from the lips of the little peasant. He

mentioned the circumstance to the chief persons of the neighbourhood. Soon afterwards, a nobleman who admired Diendorf's preaching, the Baron von Miltitz, chancing in some company to express his regret at having missed the pastor's last discourse, it was said half-jokingly that there was a boy in the village who could repair the loss, and at last Fichte was sent for. He came, and, quite unabashed, began, as he was desired, to repeat what he recollected of the discourse: gradually, as he proceeded, he grew more and more vehement, and was forgetting the presence of his auditors, when the gentlemen, satisfied with the experiment, interrupted the stream of his oratory. But the good baron was touched by his warm feeling and ripe intelligence: he resolved that the boy should go home with him and receive a learned education. The parents were at first unwilling to send their child so young into the gay society of a nobleman's residence; but their scruples were overcome by the persuasions of Diendorf, and the kind promises of the baron himself, and Fichte was allowed to depart with his benefactor. He accompanied him to his estates, which were at some distance from Rammenau, and was then, after a brief stay, sent to live with the clergyman of Niederau, near Meissen. This person and his wife were without family: they received their young charge with pleasure, and treated him as if he had been a child of their own. Here Fichte lived for some years, not only happy but industrious. He became well grounded in the classical languages; and finally, at the age of thirteen, his teacher declaring that from him he had nothing more to learn, he was removed by the baron to Pforta, the best and most celebrated of the state seminaries of Saxony.

For Fichte the change from the quiet country parsonage and its kind inmates to the rigour of a public school was at first anything but pleasing. He had been accustomed all his life to live much in the open air, but at Pforta the seclusion was almost unremitting: once a-week only the pupils were allowed exercise, and then their very sports were conducted under the eye of an usher. There prevailed, too, at that seminary, the system which in this country is called 'fagging,' and Fichte fell to the share of one of those brutal tyrants whom such a system alone can form among the young. Disgusted with the place, he determined to run away; and one day, after a prudent study of the map of Saxony, he made his escape, and took the road to Naumburg. All at once he remembered a saying of his good old teacher's, that every enterprise in life should be begun by prayer. He fell upon his knees by the road-side, and then the thought of his parents' sorrow when they should hear of his flight, overpowered him with remorse. He returned immediately to school. His absence had been observed, and he was taken before the rector, who, however, on hearing his simple story, not only remitted his punishment, but gave him in charge to another and a kinder master. From this time, no longer cramped by a slavery worse than it seems, he applied himself to his studies with successful vigour. At Pforta, with all its faults, there was every encouragement for a willing learner, and Fichte became an excellent scholar. Now, too, he began to know that there were other books in the world than those of Greece and Rome. He found means to procure some odd volumes of Wieland, Goethe, and Lessing, which he read in secret with delight. The last of these writers was his chief favourite: indeed so great at this time was his enthusiasm for Lessing, that he resolved, so soon as he should arrive at the university, to wander forth and seek personal communion with that keen and genial thinker.

In his nineteenth year he repaired to the university of Jena; but soon after his arrival, the saddest cares interposed to prevent his visit to Lessing. The Baron von Miltitz died, and Fichte found that if he wished to study, he must trust to his own diligence, and not to the miserable pittance which, at irregular intervals too, was all that the kind nobleman's heirs chose to send him. For six years he managed to keep alive. During the first

four he qualified himself for the degree of 'Candidate of Theology'; but the incessant exertions requisite to gain a subsistence, left him latterly no time for the studies that might have enabled him to pass his final examination before the Saxon Ecclesiastical Consistory. No details have been given us of his privations, and we cannot therefore compare them with what we know to have been those of many a scholar—our own Dr Adam, for instance, who was accustomed, when attending Edinburgh college, to live during three months upon a single guinea. Fichte's biographer declares the sufferings of those probationary years to have been intense, yet indeed considers them for him more in the light of a blessing than a curse. In the opinion of his son, the hard conflict he had to maintain with poverty and famine developed in him, as nothing else could have done, that independence of spirit and resolute unflinching perseverance by which he was afterwards to effect so much, on a far wider scale, in the highest provinces of thought. Towards the close of his twenty-eighth year, his destitution seems to have reached its height, and he abandoned the hope, that he had long cherished, of becoming one day the pastor of some quiet Saxon village. Too proud to ask for assistance, he saw nothing before him but death by starvation; and as he walked homewards on the eve of his twenty-ninth birthday, he doubted if he should live to see another. But to Fichte, as to so many others, help came when most wanted and least looked for. On arriving at his lodging he found a letter from Weisse,* with the offer of a tutorship in Zurich. He hastened to thank his friend, who perceived his emotion, and inquired the cause. Fichte's pride gave way. The good Weisse cheered him not only with words but deeds, and helped him through the three hard months which were still to elapse before he entered on his situation.

On the 1st of September 1791, Fichte found himself in Zurich. His pupils were a little boy and girl, the children of a wealthy innkeeper, who resigned them altogether to his care. But their other parent thought that Fichte wished to over-educate her children, and during the two years that he remained with them, she tried in all ways to thwart his efforts. Fichte saw that she, as well as his pupils, stood in need of reform. To effect this, he hit upon a plan which may appeal our Scottish tutors: he kept a journal of her behaviour to the little ones and to himself, which he laid before her weekly, pointing out whatever in her conduct he thought required amendment. His duties occupied him the principal part of the day; the evening he spent in literary composition (as yet his philosophical talent remained latent), or in the pleasant society of the place. With the worthy and whimsical Lavater he formed an acquaintance which soon ripened into intimacy. This led, during his stay in Zurich, to a far more important connexion: Lavater introduced him to the weekly parties of a postmaster named Rahn, in a union with whose eldest daughter, Joanna Maria (the god-daughter, and, by the mother's side, niece of the poet Klopstock), Fichte was to find the highest earthly happiness of life. This gifted and affectionate lady was four years older than himself; both were past the age of youthful intoxicating passion, and the attachment which sprang up between them was grounded on a clear discernment of each other's genuine worth. Fichte became her accepted lover, and as his relations with his employers grew daily more painful, he left Zurich in the April of 1790, with letters from Lavater and Rahn to important personages at Stuttgart and Weimar, in the hope of obtaining a situation as reader at a court, or the superintendence of some young nobleman's university studies.

He met with no encouragement at Stuttgart, and proceeded to Weimar with the letters given him by Lavater for Herder and Goethe. Unhappily, Herder was seriously ill, and Goethe had gone to Italy, so that Fichte saw himself again thrown upon the world. He

went to Leipzig to seek a livelihood in that great book mart as an author by profession. He endeavoured, without success, to establish a sensible journal, and to find a purchaser for a volume of essays: he began a tragedy, and, what to those who know the man will seem strangest of all, he even wrote some tales. All his efforts were fruitless, and he was forced to betake himself to his old resource of private teaching, little dreaming what a priceless boon this despised occupation was about to put within his reach. One of the Leipzig students came to engage him for a daily lesson in the transcendental philosophy. Fichte knew Kant only by name and some vague reports; but now duty itself compelled him to study his works. To his surprise, he found, after the first attempts in the obscure writings of the Königsberg philosopher, a system of metaphysics and morals of such importance, as immediately to appear to him to deserve the careful study of all thoughtful persons. Henceforth, however changeable his outward lot, he had one fixed object before his inward eye; namely, to diffuse among his fellow-men a knowledge of what he considered the only true philosophy. During the autumn and following winter, he studied and re-studied Kant's principal works, and exercised himself in committing to paper their chief doctrines in the simpler and modified form which, after laborious reflection, they gradually acquired in his mind. He passed these months not only in cheerful activity, as a teacher and a student, but with the brightest anticipations; for it was arranged that in the spring he should be united to his betrothed, take up his residence with his father-in-law, freed from the pressure of actual want, bring himself by his pen before the public, and thus strive to secure for the future an honourable existence.

The April of 1791, however, found Fichte not flying on the wings of love to Zurich, but trudging on foot to a tutorship at Warsaw. The house in which Rahn's all was invested had failed, and father and daughter were uncertain how much might be saved from the wreck of their fortune. Fichte entered Warsaw on the 8th of June, to quit it on the 25th. He had formed his engagement with a Polish nobleman, a certain Count von P—, or rather with his wife, a gay brilliant woman of the world. She had been accustomed, we suppose, to the brisk, trenchant kind of tutor so amusingly described by Mr Kohl in his *Russia*, and a specimen of which would make Dominie Sampson ejaculate his loudest 'prodigious.' She did not like poor Fichte's French accent, and there was not vivacity enough in his manner; so with a trifling sum, by way of compensation, the metaphysician was dismissed. That peculiar veneration for wisdom and wise men which had made him, when a schoolboy, meditate a pilgrimage to Lessing, now directed him, with higher views and deeper knowledge, to Königsberg, which was not far distant, and where Kant resided. His first interview disappointed him. He had come without a letter of introduction, and the calm old philosopher received his enthusiastic disciple rather stiffly. Fichte returned to his lodging, and in less than a month had completed a profound philosophical treatise, which he sent to Kant, from whom, on his next visit, he met with the warmest reception. But alas! his little stock of money was now drawing to an end; and the bookseller to whom Kant would have recommended his work was absent. We have now before us the letter which, in this emergency, he wrote to his master, requesting a small loan that he might return to Leipzig; and its calm dignity, far more touching than any pathos, might move, considering who was the writer, the heart of a Stoic. Kant declined: he himself, he assured Fichte, had been without funds for a fortnight.

This was the second time that Fichte had been brought to the verge of actual want; happily it was the last; and already, though he knew it not, better days were at hand. He had made some vain struggles to obtain private teaching, when suddenly a Königsberg

* A well-known German writer of children's books, &c.

acquaintance procured him a tutorship in the family of a nobleman near Dantzic. Recommended by Kant, it was with an ample salary that he accepted it; and he found himself in his new situation treated more as a friend than a dependent. Still greater happiness was in store for him. The bookseller returned to Königsberg, and consented to publish his work. Through some oversight it appeared anonymously. Coming from Königsberg, and written quite in the spirit, and with all the metaphysical acuteness of Kant, it was at once attributed to him. He, indeed, hastened to declare the real author; but meanwhile the book had obtained the sale which it deserved, and the enthusiastic criticisms already passed upon it could not be revoked. Nor was this all. The Rahns had recovered, and very advantageously invested a considerable portion of their property. There was nothing now to delay Fichte's union. Accordingly, in the summer of 1793, he bade farewell to his kind friends the Count and Countess von Krokow, and proceeded to Zurich, where, on the 23d of October, the marriage at last took place. After the vicissitudes of so agitated a life, Fichte was now to enjoy comparative repose. He was happy with the wife of his choice: at one stride he had gained the summit of philosophic fame, and the chief thinkers of Germany became his friends and correspondents. He had leisure for study and reflection. During the months which now passed at Zurich, he elaborated that modification of Kant's philosophy to which he gave the name 'Doctrine of Science;' and in improving and teaching which, his best faculties and remaining days were henceforth successfully employed. From this point onwards, Fichte's career is far better known to the British reader than the portion of it we have been describing; we shall therefore compress as much as possible the rest of our narrative.

Towards the close of 1793, Reinhold, the professor of the Kantian philosophy at the university of Jena, removed to Kiel, and his friend Fichte was at once invited to supply his place. Fichte wished to delay his acceptance of the offer for a twelvemonth, which he purposed to spend in perfecting his theory; but the Weimar authorities laughed at his scruples, and replied that the university would suffer by the long vacancy of so important a chair; and in the May of 1794 he entered on his professional duties. Jena was then the most numerously attended of the German universities, and among its professors were the most distinguished teachers of Germany. On this account, and from the popularity of his predecessor, Fichte's arrival had been looked for with anxiety. At his opening lecture the hall was crowded to excess; but both then and afterwards, the clearness which he gave to the most abstract of subjects, his lofty eloquence and impressive manner, far exceeded the expectations which his best friends had formed of his success. At Jena his situation was dignified and comfortable. In addition to other intimacies, he became the friend of Goethe and Schiller, and was enlisted by the latter among the contributors to his new periodical, 'The Hours.' Fichte was indefatigably earnest in discharging his duties as a professor. Besides sharpening in metaphysical inquiries the intellectual faculties of his scholars, he laboured to purify and exalt their moral feelings and habits. With this view he delivered, over and above his ordinary course, a series of lectures 'On the Vocation of the Scholar:' these were afterwards printed; and we can easily understand the abiding and ennobling influence which they are said to have exerted on his youthful and ingenuous hearers. One of his methods of rewarding the exertions of his class seems to us so novel and important, that we cannot refrain from mentioning it. He had established, in conjunction with Niethammer, a philosophical journal, and in that widely-circulated work he inserted from time to time a few of the most remarkable of the essays written for him by his students. Those who best know what young men are, will most appreciate the kindness and judgment displayed in this plan of Fichte's.

After five years of usefulness at Jena, some un-

pleasant disputes, which we have no inclination to detail here, forced him to resign his professorship, and in the July of 1799 he took up his residence at Berlin. During the next six years he lived a quiet but inwardly laborious life: he lectured occasionally to private audiences, and published several works: in both these enterprises his aim being so to expound the new philosophy that it might be understood by every person of intelligence, however unaccustomed to metaphysical inquiries. In 1805 he was appointed by the Prussian government professor of philosophy at Erlangen, where, in the summer of that year, he delivered that remarkable course of lectures 'On the Nature of the Scholar,' to which the attention of thinkers has been so strongly drawn by Mr Carlyle in the *Edinburgh Review*. The following year Prussia, after long wavering, determined on a war with France. Fichte saw, in the success of his adopted country, the only hope for the emancipation of the continent from the despotism of Napoleon, and he resolved that what help he could give should not be wanting in the struggle. He requested leave to accompany the army, that he might animate by words the heroism of the soldiers, since he could not, 'like Æschylus and Cervantes,' take his sword and 'fight in the ranks.' He was thanked, but his offer was declined. The campaign ended with the fatal day of Jena and Auerstadt, and a French army marched upon Berlin. Some of the officials and literary men of the Prussian capital remained, to submit to the conqueror, and take service under him; but Fichte was not among these, and he fled to Königsberg. He returned in the autumn of the ensuing year, and amid the general despondency, was almost the only one who still dared to protest aloud against foreign oppression. During the winter months of 1807-8, he delivered his celebrated 'Addresses to the Germans' in a public building of Berlin, where his voice was often overpowered by the roll of the French drums in the street beside him. In 1813, the year of the Liberation War, he renewed his former proposal, and with similar success; but as his offers had sprung less from vanity than from a lofty zeal, he was not pained by the refusal. And now when hostilities broke out, his wife too came forward to advance, in the only way permitted to a woman, the general weal. The military hospital of Berlin became crowded with sick and wounded; the authorities appealed to the inhabitants for help, and she was among the first to obey the call. 'By a courageous effort,' says her son, 'she vanquished her first repugnance to approach the stranger sick; and soon this employment appeared to her a sacred vocation, to which, at all risks, she was resolved to devote all her energies.'

Meanwhile, during these years, Fichte had been steadfastly toiling at his appointed task, the perfecting of his philosophical theories. In 1813 his system had reached its highest clearness in his mind, and he thought himself on the point of procuring for it a mode of expression so simple, that even a child, to use his own words, would be able to comprehend it. He proposed to spend the summer of 1814 in some quiet rural spot, and there, in peaceful seclusion from the world, attain the long-sought-for result. But 'the pale messenger' was at hand, and the wish had to remain unfulfilled. Towards the close of 1813, after many months of attendance on the sick, his wife caught, in the course of her laudable labours, an infectious fever, from which she recovered only to see her husband laid prostrate by it. Fichte was taken ill in the first week of January 1814, and on the 27th he was no more. His wife survived him five years, and was then laid in the grave beside him. The place of their interment is in a churchyard close to one of the gates of Berlin, and a lofty obelisk surmounts it with the inscription—'And they that be wise shall shine as the brightness of the firmament; and they that turn many to righteousness as the stars for ever and ever.'

In person, Fichte was below the common height, but

of a strongly-knit and muscular frame. His mien and gestures, like his words, betokened earnestness and sincerity. He had only one child, a son, who is, or till very lately was, a professor of philosophy at Bonn, and from whose biography of his father the foregoing sketch has been taken.

REMINISCENCES OF MARDI-GRAS, OR SHROVE-TUESDAY, IN PARIS.

THE inhabitants of the French metropolis will not allow themselves to be deterred from going through the regular routine of merry-making, even under the most unfavourable circumstances. On Shrove-Tuesday, 1831, *emeutes*, or riots, with all their frightful accompaniments, were raging in one quarter of the city. A religious edifice was ransacked, the sacristy turned into a masquerade-warehouse; and the patriot *chiffonnier*, or rag-gatherer, donned the priest's richly-embroidered vestments; whilst, at the very same time, the Boulevards were crowded with laughing groups gazing at the fooleries there enacted.

On that occasion a young sprig of fashion, who had just quitted the scene of devastation, was heard to exclaim, on entering the drawing-room of a hotel on the Boulevard des Italiens—'The church of St Germain l'Auxerrois is a prey to the mob!—they are violating the sanctuary!'

'Frightful!—abominable!' responded a beautiful and elegant lady. 'But look! look!—what a charming mask; and how lightly that little harlequin trips along; 'tis truly delightful!'

Thus, frivolity within sight is often so dazzling as to impair the moral vision, rendering us indifferent to surrounding evils.

In 1834, the expectations of the gay Parisians had been raised to the highest pitch with regard to the carnival, although certain profound reasoners declared that this diversion was progressively losing its attractions, in proportion to the improvement in the morals and tastes of the people; whilst others asserted that there was so much distress, that few had either the power or the inclination to play a part in such frolics. Nevertheless, this festive scene was not marked by any diminution of gaiety.

There was the usual assemblage of shepherds and shepherdesses, *poissardes*, clowns, and harlequins, who gesticulated, bawled, squeaked (Punch was also present), and leaped, as they were bound to do. The equipages were numerous and diversified; though, with few exceptions, not remarkable for elegance. Among those which attracted peculiar attention was an open carriage drawn by six horses, and preceded by mounted lacqueys playing upon French horns, and followed by a numerous and boisterous cavalcade. This carriage was crowded with splendidly-attired maskers, who distributed *bonbons* in profusion to the fair onlookers, and attacked their rivals with Neapolitan eggs filled with flour, which, on the light shell of sugar being broken, by coming into contact with the heads or shoulders of the recipients, powdered them profusely, to the great delight of the bystanders: the compliment was, however, returned with interest, the aggressors being still better pelted with similar projectiles.

But a more novel sight than this was a large and handsome landau, to which were harnessed four beautiful white horses decorated with green ribbons. In this vehicle were several of the young pilgrims of Prague, as they were called, from the circumstance of those youths of good family having visited the ancient capital of Bohemia, to offer their protestations of fidelity to the fallen monarch, Charles X., and the exiled royal family: the party was completed by some other dashing legitimatists.

One of the pilgrims was habited as a *Garde-Française*, with a large white cockade in his hat; another appeared in a Highland dress, similar to that worn (according to

the print-shops) by the youthful Henry V. during his stay at Edinburgh; a third wore the costume of a cavalier of the time of our Charles I. The cortège passed several times up and down the Boulevards, and once stopped under the windows of the *cercle*, or club, at the corner of the Rue de Grammont, and saluted a venerable duke, father to one of the young Carlists: it was even said that cries of *Vive Henri V.* were uttered.

This political promenade did not occasion the slightest disturbance: the people seemed determined to preserve their good humour; and they displayed as little animosity towards the Henriquinistes (or Henry-the-fifth-ites) as they did affection for a solitary hero of July, who, mounted on a lean and miserable hack, ambled along the Boulevards. This living emblem of the three glorious days wore an old jacket turned inside out; but his shoulders were adorned with two fine epaulettes, and on his head was an officer's cocked-hat. His *Rozinante* was not encumbered with a saddle, and the rider's long thin legs dangled on either side of the sorry steed. The hero of July did not swagger about, but quietly moved on in the middle of the road; his subdued demeanour and turned jacket being no doubt intended as a satire on some of the actors in the memorable drama of July 1830.

Even Algiers had its representatives; for a small group, disguised as Arabs, and very well mounted, caracolled in true Bedouin style.

The procession of the *bœuf-gras*, or prize ox, took place as usual. This ceremony is curious. The prize ox—a remarkably fine one, highly fed, but not unwieldy—adorned with ribbons and garlands, was led by two journeymen butchers habited as pages: on the animal's back sat a handsome little boy in the guise of Cupid, with his bow and quiver full of arrows; his wings being of fine gauze bedecked with spangles: immediately afterwards followed an elegant car drawn by two horses richly caparisoned. In the car were three or four women, masked and attired as heathen goddesses: then came a goodly troop of horsemen, equipped as knights, and attended by squires on foot; the former were master butchers, and the latter their men: there were a few more attendants—brawny fellows, personating savages, with skins of wild beasts thrown over their shoulders, and wielding large knotty clubs.

This grotesque procession started from the premises of the butcher to whom the prize ox, or *bœuf-gras*, belonged, and traversed certain districts notified in a printed programme sold about the streets a day or two before Shrove-Tuesday. It proceeded to the Tuileries, at the windows of which palace the king and royal family were assembled to receive the homage of the *bœuf-gras*. The tractable animal had been taught to kneel down when required, by a gentle pressure from one of the men who led him: he bent his knees to the king of the French, Louis-Philippe, on the very same spot, and in precisely the same way, as his predecessors had done before the preceding monarch, Charles X. Cupid kept his seat gracefully, and bowed his little round head: the other mythological personages made their obeisances; and the butcher-knights caused their steeds to curvet as they passed in array before the royal personages, who returned all these salutes most graciously. The procession then proceeded to complete its route, visiting different public authorities and persons of note on its way back to the house of the owner of the *bœuf-gras*.

Notwithstanding the threatening appearance of the weather, the footpaths of the Boulevards were crowded with maskers and spectators. Upon the whole, it was a gay and enlivening scene—that is to say, it was so for a time, after which a painful feeling arose in one's breast; and on looking at the great number of clowns capering about in their white linen jackets and long loose sleeves, outshooting their hands by several inches, and hundreds of strange party-coloured figures, some grave, others gay, and all apparently assuming characters foreign to their natural ones; most of them laughing without gaiety, jumping, yet not seeming amused,

and grinning without fun, one was tempted to exclaim—'This is bedlam broke loose; what a frenzy of forced pleasure!'

In the afternoon a cold drizzling rain came on, and a more sudden metamorphosis never followed the waving of Harlequin's wooden sword than was produced by this aqueous visitation. A noise as though a large flock of pelicans had flown up into the air out of some reedy marsh, was succeeded by the display of thousands of umbrellas, red, blue, green, and black, which eclipsed the vast body of pedestrians. Looking down from a balcony on the party-coloured mass in undulatory motion, seeking to move on in different directions, we recurred to our boyish days, when we were wont to amuse ourselves by gazing upon the ever-varying sea through the coloured glasses of a quadrant.

The usual masked balls took place; but as all sub-lunary things must pass away, so the carnival terminated with the night of Mardi-Gras.

DURATION OF LIFE IN THE PEERAGE AND BARONETAGE.

In a lately published number of the Journal of the Statistical Society, we observe a paper purporting to be an inquiry into the 'Duration of Life among the Families of the Peerage and Baronetage of the United Kingdom.' The facts, which are gathered from the books of the peerage and baronetage, bring out results which could not have been anticipated. The general belief is that these classes, by having at command all the means by which health may be preserved, and the best advice and assistance in case of illness, generally attain a longer life than other members of the community. This is found not to be a correct inference. A strict comparison of tables shows that the expectation of life among the families of the peerage and baronetage, from 20 years of age upwards, is really less than in the whole of England. On the other hand, the expectation of life is greater than among the inhabitants of the metropolis and Liverpool. The writer of the article confesses that it is difficult to offer any satisfactory solution of the results brought out by the comparative tables.

The inquiry has also been of use in determining 'another question of some little interest—namely, are there any particular ages marked by an excessive mortality? The ancients, it is well known, attached great importance to certain ages, attributing to them unusual danger and a high mortality. These ages, which were designated as the climacteric years, are the 49th, the 63d, and the 81st, entitled respectively the lesser climacteric, the climacteric, and the grand climacteric. Although the fanciful value attached to the number seven and its multiples is perhaps a sufficient explanation of the importance attached to the first two periods, it may possibly have happened that a rude observation of the ages at which death took place, bore its part in the establishment of the theory. It may therefore be worth while to submit this theory to the test of facts. The inquiry, indeed, derives an additional interest from the occasional revival in modern times of the superstitious importance formerly attached to certain numbers. On referring to Table I., it will be seen that the number of deaths opposite the age of 49 is somewhat in excess of the numbers in several preceding and succeeding years. It exceeds by six deaths the number at the age of 47, which is the highest number for all the earlier ages; and by eight deaths the highest number for the next five years. The precise numbers are—at 49 years 45 deaths, at 47 years 39 deaths, and at 51 years 37 deaths. The number of deaths at the age of 63, on the other hand, falls short of the number in the year preceding by two deaths, and only exceeds the number in the 61st and 65th year by three deaths. Again, the number of deaths at 81 years of age, though somewhat greater than in the year following, and higher than in every preceding year, falls greatly short of the number in the year immediately

preceding. Of the three climacteric years, then, there is only one (49, or the lesser climacteric,) which displays any excess of deaths, and even in this case the excess is not so large but that it may safely be attributed to a coincidence. From all that has been now stated, it would appear that there is no sufficient reason for attaching to the climacteric years an unusual importance, though there seems to be a slight increase of deaths at or about these years.'

As a contribution to the data on which life-assurance tables are formed, we consider the paper before us of no inconsiderable value.

TRAITS OF THE NORTH TWO HUNDRED YEARS BACK.

THE Inverness Courier has lately published a series of articles stringing up extracts from a manuscript history of the Family of Fraser, written about the year 1666 by Mr James Fraser, minister of Kirkhill, on the Beaully Firth. Some passages quoted from this memoir are so curious as pictures of the manners of the time, that we are tempted to bring them before a wider circle of readers. Civilisation had at that time made no great way in the north of Scotland; yet the nobles and chiefs of the country lived in a style of imposing magnificence.

In the following account of the funeral of Simon Lord Lovat, in 1632, there seems to have been a great muster of the neighbouring clans:—

"1632.—This great man died the 13th of April, to the incredible grief of all his clan and kindred. The Frasers of Lovat resolving to desert their burial-place in Beaully Minister, interred Lord Simon's corpse in Kirkhill, at the east end of the church, with a pale of curious timber-work above his grave, and erected that aisle and steeple there as their tomb, which now we see joined to the church. The funeral was sumptuous and splendid. Nothing was wanted to make it singularly solemn, regular, and orderly. The season was very inviting to the neighbouring clans to assemble. Mackintosh had 600 men well-appointed; the Grants 800; the Mackenzies 900; the Rosses of Balnagown 1000 pretty men; the Frasers a thousand and more; the Camerons, Macdonells, and Munroes, were not under 1000, well-ordered. Such a funeral was never seen or heard of in our country, computed to be above 5000 foot and horse. The arable ground all under braird was trod like a common foot-road all betwixt Bunchrew and the church of Wardlaw, yet it was observable that no such fertile fruitful crop was ever known upon the same lands as God's providence sent that year."

'Instances of summary justice were of frequent occurrence in the Highlands, and under the date 1633 we find a case recorded. In that year several of the younger sons of the gentry obtained commissions in the army "for the Swedish wars," among whom was Thomas Fraser, younger of Belladrum, who induced many of the Highlanders to enlist. One of his recruits, Donald McWilliam, deserted to the hills of Glencounvinth, and was pursued by Alexander Urquhart, "my Lord Lovat's chief gentleman." The deserter stabbed Urquhart with his dirk, and he died on the spot. The murderer was afterwards decoyed into the house of one Thomas Fraser, who promised to protect him; but, calling in two gillies, this treacherous host cut off the man's head, "which the gillies brought to Lovat." How the bloody present was received is not recorded.

'The following notice of the state of the medical art in the north of Scotland occurs in the year 1636:—"Doctors and persons of skill we had not then in the north; only a few common chirurgeons and traversing sharitans (charlatans) out of Ireland. There was one Mr John Sheils, vulgarly termed Dr Sheils, that had past some experiments in the country, and this fellow was called to Lovat by my lord and lady's desire. And at first view he confidently engaged to cure her [Lady Lovat], but quite the contrary. After his long stay in the family, and using potions and topical applications, she grew worse and worse." The dissolution of the monasteries would, in this respect, be a loss to the Highlands, for the monks were generally skilled in medicine. It is curious, however, to find Irish travelling doctors at that time wander so far in quest of practice.

'The following is what we should now call a curious coincidence. "1638.—Now is the marriage of John, Earl of Sutherland, with Mistress Anna Fraser, the Lord Lovat's

daughter, going on; and it was notour [notorious] that, two years before, the earl passing this way with his first wife, Lady Jean Drummond, to pay a visit to my Lord Lovat, at the church stile of Wardlaw, riding by, the earl caught a fall with his horse, flat upon the shipping rock. His lady gave a shout, saying, 'God save you, my heart! You will be either married or buried at this church;' and so now it happened, by a good Providence, that he was married to Lady Anna Fraser, in the church of Wardlaw, and consummated a solemn wedding feast at Lovat."

'Weddings and funerals, those great landmarks in family history, are described with suitable dignity and minuteness by our local chronicler. There is a circumstantial fulness in some of his narratives of these events which presents every feature of the scene before us, though his devotion to the house of Fraser may have sometimes led him to colour his pictures too highly. We subjoin an account of the marriage of the Master of Lovat in the reign of Charles I. "1642.—The marriage betwixt Hugh Fraser, Master of Lovat, and Anna Leslie, Lord Alexander of Leven's daughter, is at length solemnised and consummated at Holyrood House, April 30, 1642. It may seem an extravagant rant to speak of the glory and expense of this sumptuous wedding feast, where eleven peers were present, besides general persons, barons, and gentlemen. All May and most of June were spent in visits and treats in city and country—those great persons being invited and regaled by all sorts of relations and acquaintances, even to the astonishment of such of their retinue as accompanied them from house to house. About the close of June, the new married couple came off from Edinburgh, accompanied with a noble train of peers and gentlemen—the Earl of Wemyss, Lords Leven, Boyne, Ruthven, Sinclair; and, coming through Moray, they were punctually attended and feasted by all the lairds and gentry. They paid a visit to old Lady Lovat, and that night to Dalross, where they were well lodged and accommodated. The castle being the lady's own as her mansion-house, it was proper she should see it, and abide a night in it in transitu; and herself was heard to say to her friends and convoy, that they were most welcome to her habitation, and they were most cheerfully treated there at a great rate. Here the gentlemen of the name of Fraser met them, conveying their young chief in state through Inverness, where they were most sumptuously treated with all sorts of wines at the Cross, and tables covered. Provost Forbes acquitted himself to purpose. The Cuthberts now were great at Inverness; they mustered the train-bands of the town in the streets to keep off the rabble, and attended those noble persons to take a view of the castle, which was then in good order indeed. After this compliment to the Master of Lovat and his crowd of convoy at Inverness, through the streets, they went over the famous wooden bridge, where there were 400 young gentlemen in arms, well-appointed, on the Green, to conduct them forward. Some of the Lowlanders never saw such a sight of Highlanders in arms, and all present declared that the best peer in the nation might be vain and glory in such a brave guard and attendance, all of his own name. At Bunchrew, Inverlochy gave them a welcome and genteel treat. Thence to Lovat, where they arrived at their journey's end in health and safety. At the gate, my Lord Lovat, with twenty brave gentlemen of his own name, met them: and pray what could be wanting here for preparation and feasting?—liquors of all sorts, mirth, music, and good management of all things. This was a wonderful fruit year, and abundance of all kinds, field and garden fruits, berries and cherries, summer pears and pippins, such varieties and plenty, that the Lothian and Fife gentlemen declared they came not to visit the rude Highlands, but the cultivated Canaan! They admired the orchards of Lovat and Beaully, and the fishing of the river and linn was charming. They had hunting, fishing, fowling, archery—good diversions. Nor was tilting, riding, jumping, or combating wanting; for men began now to learn the use of arms, and, alas! soon after they got sad trial of such. The Earls of Sutherland, Balmagown, and Fowla, came here to visit the lords, and as there were good fare and cheer, so there was very jovial facetious society."

'The ravages committed by Montrose's army in 1646 are strikingly described by the annalist in a few picturesque words. "Betwixt the bridge-end of Inverness and Guisachan, sixteen miles, there was not left in my country a sheep to bleat, or a cock to crow day, nor a house unruined, so severe were the depredations." One countryman seems to have made a firm stand, and the picture presented by

his attitude of resistance is not unlike a grotesque Dutch painting. "Lieutenant William Fraser, vulgarly *William Goick*, stopped the pass and common road above Rindow, four men in arms with him. He takes out a strong barrel of ale from the drinking-house, and sets it on the high road, and rides straddling over it; he breathes the vessel, and calls to all going by to drink the king's good health. Not a man, horse or foot, comes near him for two days; some rode by below him, some above, and never any came near him all the while, he appeared so formidable to Montrose's people. When he drank a health it was accompanied with a shot, and there he continued, like a sentinel, for some days, until the fury was over."

'The Lovats of those days seem to have kept state to the full, even if we allow some exaggeration in the narrative of their faithful clansman. The following is a portrait of a Highland baron of the first class in the seventeenth century. There is no mention of a bard or piper, but doubtless these indispensable auxiliaries were retained at home. "1661.—My Lord Lovat and his lady came north from Edinburgh, July 27; were most sumptuously treated at Inverness by the magistrates, John Forbes of Culloeden being provost; and at the bridge-end of Inverness was waited upon with sixty horse, gentlemen of his own name, and six hundred foot, well appointed, and Hugh Fraser of Struy, his lieutenant-colonel, Hugh Fraser of Foyer, major; I myself present at that pleasant parade. My lord came to Lovat in the evening with his friends and retinue; and I can say there was nothing wanting that could be necessary for a sumptuous feast and entertainment, and that which made that infer splendid was the convocation of my lord's friends and allies to welcome him home to his country. His domestic servants and attendants were John Allan, his chief gentleman, and Will White, his page; Robert Carr, master of the household, and James Fraser, steward; John Ceird, groom; William Innes, groom; John McCall, stabler; John Dawson, brewer; William Glass, cook; John Macleod, his servant; Farquhar Fraser and Alexander Peddison, chamberlains; John Maccallister, a Fraser, porter, &c. Isabel Fraser, *alias* Forbes, maid of honour; Isabel Dempster, Marion Reid, Anna Dingwall (nurse), Anna Tulloch, and Anna Hay, maids. I am the more punctual to set down the servants' names, because I had the conduct and government of this noble family for two years, until I entered minister of the church at Wardlaw. My lord spent the remainder of July and most of August in visits; went over to Braban, Coul, Fairburn, Dochnahug; went to see Fowla, and Balmagown, and Tarbat; and then visited the Chisholm of Strathglass [This shows that the title *The Chisholm* is of pretty old date], at Erchless; also Struy, Chibockie, and Belladrum. And afterwards with his lady and train went to Stratherrick, visiting Foyer, and all the numerous families in that country. This I was witness to, as being his domestic (chaplain)."

'The following account of a wedding contract at Darnaway opens a scene of great festivity and splendour. It would seem to have been a very *jolly* affair. There was an old connexion between the noble families of Moray and Lovat. Hugh, the second Lord Lovat, according to our manuscript, married Janet, daughter to the Earl of Moray, in 1440. The wedding, we are told, "took place at the great hall at Tarnway; there is no such lodging in Scotland, for to this day that house hath no parallel within the kingdom. It was built by the regent, Earl Thomas Randolph; kings have been in it, and king James said that he had no such court or castle of his own." This venerable apartment, it is well known, still remains, though defaced about fifty years since by modern innovation. It is still, however, a noble and august hall. "1662.—In January, my Lord Lovat was invited by Sir Hugh Calder to witness his espousals and contract at Tarnway (Darnaway), and, though the storm was great, would not decline the call. So he gets his uncles, Alexander, the tutor of Lovat, and Thomas Beaufort, and his own train, and we were the first night at Dalross, where we were very well treated; in the morning set forward, and came to Tarnway to dinner, where we got a generous welcome, and stayed all night. The earl waited upon Lovat to his bedchamber, telling him this was the king's apartment and bed, where he was to lodge while he stayed at Tarnway. Next morning, the Lady Henrietta Stuart was solemnly espoused to Sir Hugh Calder of Calder, and I deemed that she loved my Lord Lovat better, and had he not been married already, this had been a meet match by far. The gloves and contract ribbons

being distributed in state, we had a most solemn feast, a wedding rather than a contract dinner. In the afternoon the wits of the house gave anagrams and acrostics in writ to the bride, and I judged Lovat gave the most apposite of all—Henreta Stuart, a true sweetheart!—which, with the acrosting pertinent verse, was applauded, the bridegroom, Sir Hugh, the greatest poet in Moray, being the most competent judge in that case. After a surfeit of sincere friendship and feasting, my Lord Lovat, the fourth day, takes leave of that noble family of Moray; and at parting, the final compliment was my Lord Lovat taking horse, rides up the scale-stairs of Tarnway, and in the great hall drinks the king's health with sound of trumpet and pistol-shot; the meanest drunk bowls of wine, with snow-balls cast in for sugar. And after many a loath farewell, sounded good night and joy be with you. Taking horse at Tarnway, Mr Francis and Sir Hugh Calder, and others, convoyed my Lord Lovat off to the high road, and at parting exchang'd (exchanged) servants; my Lord Lovat leaving Thomas Fraser, Teanikill, with Calder, who sent his servant, John Campbell of Achindown, with Lovat, to attend him at his own house of Calder, where we were treated at a singular rate. The kingdom could not afford better wines than was drunk, and music of all sorts; Adam Smith (master of the musicians in Moray for virginal, violin, harp, and organ) was Calder's domestic; Mr William Cumming (an excellent learned youth), chaplain in ordinary; and varieties of diversions. In all things the entertainment was princely, Saturday, Sunday; and on Monday Sir Hugh Calder himself came to us with an addition of what was wanting, if any at all, of good cheer and fare. We spent that day in a charming converse of sport, gaming, and singing. Next morning Calder convoyed my lord from his own house over the river to visit the baron of Kilravock and his lady; thence to Coule to see the Sheriff Rain. He at last added to our train, and rode forward to visit Cul-loden, and thence to Drakes to pay his respects to the Lord Macdonell; and thence to Inverness in no small state, few or none parting with my Lord Lovat that once met with him on his journey, he was so universally beloved and respected of all ranks and degrees of persons. Such a progress and parade as this of Lovat's was in the limits of ten days, through Moray, all things considered, was so singular, that such another I saw not since I came to my native soil from abroad."

"1668.—*The Earl of Traquair's Fall*.—A remarkable death this year was that of John Stewart, the old Earl of Traquair, time, place, and manner considered. This man was king James VI.'s cousin and courtier. Charles I. sent him as high commissioner down to Scotland, and he sat as viceroy in the parliament, June 1639. He was early at court, the haven of happiness for all aspiring spirits, and this broke him at last—he became the tennis ball of fortune. What power and sway, place and preferment he had then, I need not mention; only this, keeping then with the revered bishops, and tampering under board with the Covenanters, he acknowledged to be his bane, but whether then by his own misconduct, or by paction and resignation of his interest to his son, or the immediate hand of God upon him, I search not; but he proved a true emblem of the vanity of the world—a very meteor. I saw him, anno 1661, begging in the streets of Edinburgh. He was in an antique garb, and wore a broad old hat, short cloak, and panniers breeches; and I contributed in my quarters in the Canon-gate towards his relief. We gave him a noble, he standing with his hat off. The Master of Lovat, Culbockie, Glenmoriston, and myself were there, and he received the piece of money from my hand as humbly and thankfully as the poorest supplicant. It is said that at a time he had not to pay for cobblering his boots, and died in a poor cobbler's house."

THE CHOCOLATE TREE AND ITS USES.

WHAT is generally called cocoa is merely the berries of *Theobroma Cacao*, pounded and drank either with water or milk, or with both. Chocolate is a compound drink, and is manufactured chiefly from the kernels of this plant, whose natural habitat would seem to be Guayaquil in South America, though it flourishes in great perfection in the West Indies. It grows also spontaneously and luxuriantly on the banks of the Magdalena. Mr Schomburg, in his recent expedition into the interior of British Guiana, found the country abounding in cocoa, 'which the Indians were

most anxious to secure, as the pulpy arillus surrounding the seed has an agreeable vinous taste. Singular to say, however, they appeared perfectly ignorant of the qualities of the seed, which possesses the most delightful aroma. Mr Schomburg states, they evinced the greatest astonishment when they beheld him and Mr Goodall collecting these seeds and using them as chocolate, which was the most delicious they had ever tasted.'

The height of the cocoa shrub is generally from eighteen to twenty feet; the leaf is between four and six inches long, and its breadth three or four, very smooth, and terminating in a point like that of the orange tree, but differing from it in colour; of a dull green, without gloss, and not so thickly set upon the branches. The blossom is first white, then reddish, and contains the rudiments of the kernels or berries. When fully developed, the pericarp or seed-vessel is a pod, which grows not only from the branches, but the stem of the tree, and is from six to seven inches in length, and shaped like a cucumber. Its colour is green when growing, like that of the leaf; but when ripe, is yellow, smooth, clear, and thin. When arrived at its full growth, and before it is ripe, it is gathered and eaten like any other fruit, the taste being subacid. Chocolate, so called and so prized both in the Spanish continent and in the West Indies, never reaches Great Britain except as a contraband article, being, like nearly all colonial manufactured articles, prohibited by the customhouse laws. What is generally drank under that name is simply the cocoa boiled in milk, gruel, or even water, and is as much like the Spanish or West India chocolate as vinegar is to Burgundy.

It is, without any exception, of all domestic drinks the most alimentary; and the Spaniards esteem it so necessary to the health and support of the body, that it is considered the severest punishment to withhold it, even from criminals; nay, to be unable to procure chocolate, is deemed the greatest misfortune in life! Yet, notwithstanding this estimation in which it is held, the quantity made in the neighbourhood of Carthage is insufficient for the demands of the population, and is so highly priced, that none is exported but as presents. The signs by which good chocolate or cocoa is known are these: it should dissolve entirely in water, and be without sediment; it should be oily, and yet melt in the mouth; and if genuine, and carefully prepared, should deposit no grits or grounds. That made in the West Indies and in some parts of Cuba is dark, but that manufactured in Jamaica is of a bright brick colour, owing to the greater quantity of annatto which is used in the preparation, and which I think gives it a richer and more agreeable flavour. In an economical point of view, chocolate is a very important article of diet, as it may be literally termed meat and drink; and were our half-starved artisans, overwrought factory children, and rickety millinery girls, induced to drink it instead of the innutritious and unwholesome beverage called tea, its nutritive qualities would soon develop themselves in their improved looks and more robust constitution. The price, too, is in its favour, cocoa being 10d. per pound, while the cheapest black tea, such as even the Chinese beggar would despise, drank by milliners, washerwomen, and the poorer class in the metropolis, is 4s. a pound, or 310 per cent. dearer, while it is decidedly injurious to health.

The heads of the naval and military medical departments in England have been so impressed with the wholesomeness and superior nutriment of cocoa, that they have judiciously directed that it shall be served out twice or thrice a week to regiments of the line, and to the seamen on board her majesty's ships, and this wise regulation has evinced its salutary effects in the improved health and condition of the men. Indeed, this has been most satisfactorily established in Jamaica among the troops; and a remarkable fact corroborating this statement is, that, by returns to the Horse Guards, it is shown that only one death took place at Newcastle Barracks, in that island, out of a force of 700 men, for the quarter ending September 30, 1842; and the same may be asserted of other regiments in the West Indies, and of the seamen in her majesty's ships on the coast. But the excellent qualities of chocolate were known not only to the Mexicans and Peruvians—from whom, as a matter of course, the Spaniards acquired a knowledge of its properties—but European nations also acknowledged its virtues. The Portuguese, French, Germans, and Dutch, considered it an exceedingly valuable article of diet, and Hoffman looked upon it both as a food and a medicine. In his monograph entitled '*Potus Choco-*

late,' he recommends it in all diseases of general weakness, macies, low spirits, and in hypochondriacal complaints, and what since his time have been termed nervous diseases. As one example of the good effects of cocoa, he adduces the case of Cardinal Richelieu, who was cured of eremacausis, or a general wasting away of the body, by drinking chocolate.

Liebig and other chemists have demonstrated beyond question that no part of an organ which possesses motion and life is destitute of nitrogen:—'All parts of the animal body which have a decided shape, which form parts of organs, contain nitrogen;' and the chief ingredients of the blood contain 17 per cent. of nitrogen, and no part of an organ less than 17 per cent. It follows, therefore, that nitrogen is that principle of the body which, being in the greatest quantity, and pervading all tissues, is that most frequently wasted, and most frequently in need of renewal. This must be admitted. It follows, then, that those substances which possess this principle in the greatest quantity in a given bulk, are those which must be best calculated to renew that which has been lost or wasted by the operations of the body. Now caffeine (the principle of coffee) and theobromine (the principle of theobroma cacao) are the most highly nitrogenised products in nature, as the following analyses will show:—Caffeine, according to Pfaff and Liebig, contains

Carbon,	49.77	Nitrogen,	26.78
Hydrogen,	5.33	Oxygen,	16.12

Theobromine, according to Woskresensky, contains

Carbon,	47.21	Nitrogen,	35.38
Hydrogen,	4.53	Oxygen,	15.80

DUMPER DOGS.

The following curious fact in natural history occurs in a letter from the Mauritius to Professor Bell of King's College, London:—In coming from Leechelles hither we touched at Juan de Nova, where I had an opportunity of seeing for the first time an island of purely coral formation. It is of a horse-shoe shape, about twenty-one miles long, and from a half to three-quarters of a mile broad, with extensive reefs around it abounding with turtle. Dogs of different kinds have been left there from time to time, and finding abundance of food in the turtle eggs, young turtle and sea-fowl have multiplied prodigiously, so that there are now some thousands of them. I can testify from personal observation that they drink salt water, and they have *entirely lost the faculty of barking*. Some of them which have been in captivity for several months, had not yet lost their wild looks and habits; nor had they any inclination for the company of other dogs, nor did they acquire their voice. You may perhaps have heard of this before; if so, my notice will confirm your knowledge; if not, I hope the fact, as being of my own ocular demonstration, will prove interesting. On the island the dogs congregate in vast packs, and catch sea-birds with as much address as foxes could display. They dig up the turtle eggs, and frequently quarrel over their booty. The greater part of them droop their tails like wolves, but many carry them curled over their backs. They appear to consist of spaniel, terrier, Newfoundland, and hound, in various degrees of mixture, and are of all colours except pure white or brindled.

THE STOMACH.

I firmly believe that almost every malady of the human frame is, either high-ways or by-ways, connected with the stomach. The woes of every other member are founded on your belly timber; and I must own I never see a fashionable physician mysteriously consulting the pulse of his patient, but I feel a desire to exclaim—Why not tell the poor gentleman at once, 'Sir, you have eaten too much; you've drunk too much; and you have not taken exercise enough!' The human frame was not created imperfect. It is we ourselves who have made it so. There exists no donkey in creation so overloaded as our stomachs.—*Bubbles from the Brumens.*

POWER OF MACHINERY

At Calcutt, in the East Indies—whence the cotton cloth called *calico* derives its name—the price of labour is one-seventh of that in England; yet the market is supplied from British looms.—*Babbage.*

THE DEAD IN THE SEA.

[FROM THE GERMAN OF FERDINAND FENELIGRAT.]

UNDER the sea-waves bright and clear,
Deep on the pearly gravelly sands,
Sleeps many a brave his slumber drear,
Who joined the gay and gallant bands
That pushed from forth their land and home,
Companions of the wild sea-foam,
When blasts arose and tossed their bark,
Till, whelmed beneath the waters dark,
The storm-king claimed them for his own,
That late in life and beauty shone!

Under the sea-waves green and bright,
Deep on the pearly gravelly strands,
Sleeps many a one in slumber light,
But not by the storm-king's ruthless hands;
For there, within his narrow berth,
Lies the cold corpse of clammy earth!
Never to hail a harbour more,
Never to reach a friendly shore;
To a rude plank his form they lash;
Heave over board—waves sullen plash!

Ocean-depths yawn widely gaping,
Graves in the mirror-sea to form;
Churchyard hillocks there are shaping,
Every swell of the heaving storm!
Could we descend into the deep,
Could we but still the waves to sleep,
There might we rows of sleepers see,
Count the white bones lie glittering—
Things that the polypos spins so fine,
Weaving his network beneath the brine;
There might we see them pillowed fair,
On moss, and sand, and soft sea-weed;
Grinning in death, behold them there!
Flashes in shoals around them breed,
Swordfish pollah their bony arms,
Mermaids mutter their mystic charms,
And deck them out to make them fair,
With many a gift of ocean rare!

One anoints, while another kneels,
Braids the long neglected tresses,
From the soft purple shell now stealing
Bloom for the wan and bony faces.
One with a pearly necklace long,
Weaving a wild and mournful song,
Wanders among the dead in the sea,
Glittering with ornaments wondrously.

There may you see the shrivelled arm,
Gleaming in amber's golden glow;
There the bright coral's crimson charm,
Naked skull wreathing—blanched like snow.
Pearls the most precious—pure and white—
Glare in those vacant orbs of light;
And the sea-reptiles, loathsome, crawl
In and out, and around them all,
Sucking the marrow from the bones
Greedy, of those shipwrecked ones.

There might we see the stately mast
Bearing its freight of corpses lashed,
Clasped by the sea-rock, where the blast,
Shattering it fiercely, wildly dashed;
Gnawed by the worms, unconscious sleeper,
Rooted to rock-cliff all the deeper,
Dreams perchance of the granite tower
Beetling above his home's sweet bower;
For under the sea-waves bright and green,
Among pure pearls of the silvery sheen,
Many a rustic companion sleeps,
Who sank in the wave-worn ocean deeps.

Slumber they far from home and hall;
Flowers there are none to deck their bier;
Friends are not nigh to spread the pall,
O'er their pale forms to shed the tear.
Balm rosemary there is none;
Roo-roes never shall breathe upon
Graves where, sweet, they sleep 'neath the billow,
Waving around no weeping willow.

Matters it not! Though fall no tear
Over the corpse in his briny bier,
Troubles it not the 'dead in the sea'—
Salt tears around them flow ceaselessly.

VEHICULAR STATISTICS OF LONDON.

NO. I.—OMNIBUSES.

It has been calculated that the enormous concourse of houses through which the river Thames threads its long and devious way, known as London, spreads over an area not much under twenty square miles. Taking in, however, its suburbs, chiefly consisting of the towns and villages which have been gradually linked with it by long chains of bricks and mortar, the whole circumference of the metropolis may be about fifty miles. Within this fifty-mile circle there reside upwards of two millions of human beings.

It is quite clear that to keep up that intercourse with one another which is essential to men residing in the same town, the natural means of locomotion are quite inadequate. To provide, therefore, more convenient, rapid, and less fatiguing means of transport, vehicles of all sizes, shapes, and descriptions, are constantly moving about the streets of London in all directions. These conveyances form to the stranger striking objects; their use helps to reconcile him to the bewildering distances at which his acquaintance live apart, affording him cheap and ready locomotion from and to any part of the town, at any hour of the day or even of the night he may need it. The vehicles plying in the streets of the metropolis and its suburbs for hire, chiefly consist of three kinds—omnibuses, cabs, and hackney-coaches. The statistics and management of these carriages, the laws by which they are regulated, and the peculiarities of the individuals who drive and attend to them, form a curious and interesting chapter in our social history.

By far the cheapest, best regulated, and most convenient class of vehicles are what the 6th and 7th Victoria calls 'Metropolitan Stage-Carriages.' These consist of omnibuses and stage-coaches journeying within the limits of the police district; which extends over a radius of fifteen miles from Charing-Cross. The rise of the system by which these conveyances are now managed is recent, and its progress has been extremely rapid. Fifteen years ago, a few very slow and unpunctual stages were the only means of transit provided for the citizens to convey them to their suburban residences. A little earlier, only one stage plied from Paddington to the Bank, along a road over which an omnibus now passes every three minutes in the day; and this single vehicle, going in the morning and returning at night, was not always full. Its fares were two shillings inside and eighteenpence outside. The same distance is now travelled over for sixpence. Stage-coaches have been almost entirely superseded by omnibuses. Perhaps the latest 'on the road' are one or two which ply between Hampstead and the city.

The change from the quiet sober proceedings of these

old-fashioned 'short' stages to the rattling activity and bustle of the new school, pictures most vividly the alteration which a few years have made in the habits and notions of the London public. Let us, for example, recall the daily routine of the vehicle which five-and-twenty years ago plied between Gracechurch Street and Peckham, a village some three miles south of London. The driver, probably an honest old broken-down guard or coachman of some 'long' stage, made his appearance in the stable-yard about an hour and a-half before the time he would be required to finish his three miles' journey. Having seen the horses 'put to,' and driven them round to the booking-office at the green grocer's to receive his orders for the day, he made his first call to take up one of those gentlemen whom he regularly drove to and fro daily. Now if, on arriving at his first patron's house, Mr Jones had not quite done breakfast, the driver made no objection to wait long enough for the leisurely imbibition of the last cup of coffee; and when, after some exercise of patience, Mr Jones was at last seated, he would drive off to Mr Smith's, who would perhaps be found waiting on his steps, having his greatcoat leisurely helped on by his maid-servant, with Mrs Smith at the parlour door wishing him good-by, and entreating him not to catch cold. The coating and shawling over, Mr Smith would get slowly into the coach, and be driven with his friend Jones to his friend Robinson's. Perhaps the last gentleman was also a little behind, and there was another delay of five minutes. At length he appears in the front garden ready to start; but lo! he has forgotten his lunch, and out rushes his wife announcing that fact, and bringing a whity-brown parcel: out also rush seven or eight children, who call papa to account for attempting to go away without kissing them. This little family scene duly enacted, Mr Robinson really is ready, and the stage wends its way up Camberwell Lane to make its fourth call—perhaps for a maiden lady going to spend the day with a friend in town, who makes her appearance with her dress-cap carefully screwed up in an old newspaper. Meantime a few outside passengers are picked up—people in humbler circumstances, who, however much inclined, did not dare to ride inside for fear of offending the aristocratic notions of their superiors. Had, for instance, the lady with the cap found her grocer seated inside the vehicle, in the place of either of those highly 'respectable' characters, Messrs Jones, Smith, or Robinson, she would in all probability have taken away her custom both from the coachman and the tea-man. By such class-prejudices were the suburban aristocracy of London swayed only a quarter of a century ago. But now omnibuses have changed all that. When we were last in London we rode to the Bank between a peer of the realm and a common soldier!

The Peckham stage, being at length fairly upon the

road, would arrive at its destination about the appointed time—a little before ten—its passengers separating to meet again at four, and to be set down in time for a five o'clock dinner, in exactly the same order as they were taken up in the morning. Such is a fair sample of the stage vehicles of London five-and-twenty years ago. Let us now give an insight into the state of metropolitan stage-carriages at present. The change, considering the shortness of the interval, is wondrous, and it has been mainly effected by the introduction of omnibuses.

In July 1829, a coach proprietor named Shillibeer started the first omnibus that ever successfully plied in this country. Such carriages had long been common in Paris; but when, so far back as 1800, a similar vehicle was put upon the road in London with four horses, it looked so exceedingly like a hearse, that people would not ride in it. The peculiar advantage of Shillibeer's carriage was its great capacity, which enabled him to accommodate from seventeen to twenty passengers at but little greater expenditure than what was required by the old stage-coaches to convey twelve or fourteen. This caused an important reduction in the fares. Again, at least ten of the passengers were protected from bad weather; whilst, by the old system, not more than four, or at most six, could ride 'inside,' and that at nearly double the cost of outside places. Shillibeer made no difference in the charge: his omnibus was therefore much patronised. It ran between Greenwich and Charing-Cross, and was drawn with three horses abreast; but this was found not to answer, the middle horse being always severely distressed by the irregular stepping and perspiration of its neighbours. After some of the new vehicles began to run on the Paddington road—which success between Greenwich and Westminster soon led to—only two horses were used, as now.

By this time the coaching interests of the London suburbs had risen in importance. The increase of population along the various roads 'off the stones' (as those parts of London beyond the limits of the paving-stones were designated) had called out a number of short stages, a little quicker in their motions and a degree lower in their fares than the old originals. When, therefore, Shillibeer set up his omnibuses with fares still more reduced, the proprietors of the stages violently opposed him. They lowered their prices to his standard; they sent their vehicles along side of his during each journey, to annoy his passengers and seduce them from his omnibuses. At length they fought him with his own weapons, and started omnibuses of their own. Against this powerful combination he was unable to stand, and was at length 'driven off the road,' leaving behind a very great improvement in conveyances. To Shillibeer at least belongs the merit of introducing omnibuses and cheap fares into this country, and the public owe him something for the boon. He is now, we learn, trying to make head against the extravagant charges of funeral-coach providers,* having begun an establishment of his own to furnish such vehicles at a reasonable rate.

When Shillibeer left the Paddington road, the proprietors began to quarrel amongst themselves, and to oppose each other with the fiercest acrimony. The men they employed to drive and to receive the fares were coarse fellows, who used the foulest language, and performed the most reckless feats in driving and racing. To such a degree of ruffianism was this opposition carried, and so inconvenient was it to the public, that a number of gentlemen formed themselves into a society called the 'London Conveyance Company,' thus instituting a fresh opposition, and one which was sure to succeed. They started commodious vehicles, with steady drivers, whom they forbade to race, though

they exacted strict punctuality in starting and arriving. The conductors or guards were men picked out for their civil deportment and good temper. This happened in 1836, and so well did this sort of opposition answer, that the system became in a short time completely changed. The belligerent proprietors saw their error, and profited by the example of their new and orderly opponents. They shook hands, and formed themselves into an association with the view of framing and adhering to such regulations for the management of their vehicles as the London Conveyance Company had instituted and found of so much benefit. After a time, every trace of opposition was effaced, and the two companies joined to 'work the roads,' as they call it, for their mutual advantage. By this union a system has been formed by which an amount of coach accommodation is provided for the London public that twenty, or even ten years ago, could not have been dreamt of.

Before explaining this system, it is necessary to premise that Paddington is the terminus of two highly important arteries of transit in the metropolis. The northernmost is called the 'New Road,' which is nearly five miles long, ending at the Bank of England. On each side of this road is a concourse not only of houses, but—behind them—of whole neighbourhoods, some of which were in their time detached villages and hamlets surrounded by fields. They are now thickly inhabited, and as the omnibuses pass along, a constant supply of passengers to and from the city is furnished by these neighbourhoods. The other main line is even more densely populated, for it intersects the heart of the metropolis. Commencing with Oxford Street (or rather with Bayswater and Nottinghill), it is continued by St Giles's, Holborn, Skinner, and Newgate Streets, Cheapside, and the Poultry. By this road the distance is about four miles and a half. Though both these routes begin at Paddington and terminate at the Bank, in no district are they less than a mile apart, except near their confluence at either end. Consequently they are supplied by two separate services of omnibuses.

One of these—the most important establishment of this nature in London, and consequently in the world—is that which provides omnibuses for the Oxford Street route. It is called the 'London Conveyance Company,' which, besides the original shareholders of that society, consists of several of the old coach proprietors. The stock in trade of this company consists of eighty-two omnibuses, with a stud of not less than 1000 horses. Each of its carriages performs upon the average six journeys per day; so that it requires at the very least ten horses to work each omnibus, independent of casualties, which must be provided for. Instead of the poor worn-out animals which used to drag our Peckham friends to and fro, these horses are necessarily of great strength, are carefully attended to, and liberally fed. The work they do would have astonished a 'whip' of the old school. They occasionally draw over hill and level at a sharp trot not only the heavy omnibus, but nineteen or twenty persons, most of whom are above the ordinary weight; for it is your obese folks who have the smallest inclination to walk, and are consequently the most frequent customers to the conveyance companies. On the other hand, the animals are never taxed beyond their strength; it being an obvious policy to keep the cattle in good health. To this end the company engage an experienced veterinary surgeon, under whom is a staff of assistants and farriers, besides upwards of eighty horse-keepers or grooms. They employ also eighty-two conductors, and eighty-two drivers. The number of persons therefore belonging to the London Conveyance Company cannot be much under three hundred.

Thanks to this establishment, a person in haste who may be in any part of the line of route, and wish to be conveyed to another district, can assure himself that in three minutes at most an omnibus will approach to be at his service; and if it be at the busiest time of the day he will not have to wait longer than a minute

* See Mr Chadwick's report to the Poor-Law Commissioners on 'interment in towns' for the particulars of some of these preposterous charges.

and a-half. To insure this, the London Conveyance Company manage thus:—At their office in Paddington, at various parts of the line, and at the city terminus, they employ time-keepers to see that the driver of each omnibus starts, arrives at certain places, and at the end of his trip at particular minutes of the day, which are allotted as his instant of appearance. In this way an omnibus starts from the company's office every minute and a-half from nine o'clock till twelve; from twelve o'clock till three an omnibus starts every two minutes; from three o'clock till five the intervals are again reduced to a minute and a-half. They are increased to two minutes from five o'clock till nine at night, and then up to half-past ten o'clock the omnibuses succeed each other along the road every three minutes. Thus, from nine o'clock in the morning till half-past ten at night a constant chain of communication is kept up between Paddington and the heart of the city, the links of which may be said to vary in length from one minute and a-half to three minutes. As each vehicle performs six entire journeys, or twelve trips, the whole number of vehicles complete 492 journeys, and go over 2214 miles every day. Supposing we take as an average ten passengers for each trip, the gross receipts of the London Conveyance Company must, if that guess be an approximation to the truth, amount to £246 per diem, or £89,790 per year: this sum being contributed by the public for about three hundred and sixty-five thousand sixpenny rides. It must, however, be remembered that the company have to support an establishment of nearly 300 persons, and 1000 horses, besides keeping a stock of 82 omnibuses in repair, and paying a very heavy duty to government.

The other route to the city by way of the 'New Road' is provided with omnibuses by what is called the 'Conveyance Association.' This consists exclusively of the old masters with whom in this instance the gentlemen originally forming the London Conveyance Company are not immediately associated. The nature of the connexion between these two bodies is rather complicated. When the junction of the entire Paddington omnibus proprietary took place, some masters had omnibuses on both lines of road. It was agreed, therefore, that they should contribute such of their vehicles as ran 'over the stones' to the general stock of the London Conveyance Company; clubbing those which traversed the New Road under their own united management. The profits of each company are divided according to the number of 'turns out' (omnibuses, horses, and men) each shareholder originally contributed to the general stock. Thus supposing a proprietor to have contributed at the outset one 'turn out' to the London Conveyance Company, and another to the Association, no account is taken of the separate earnings of these particular vehicles, but one share of the gross respective earnings is awarded to him at the end of the day or week.

Belonging to the 'Association' there are fifty-five omnibuses, with the same number of conductors, drivers, and horse-keepers. They start without variation or interruption every three minutes from eight o'clock in the morning till half-past ten at night during the week; but at certain hours on Sunday the traffic being much greater, as many as thirty omnibuses begin their journeys within the hour. The regulations are precisely the same as those of the London Conveyance Company. Indeed, as above explained, some of its managing committees act for both companies.

One of the greatest difficulties the proprietors have to encounter arises from an inability to prevent speculation by the drivers and conductors. It is impossible for the managers at head-quarters to ascertain how many passengers may have ridden during each journey. Mechanical checks of various kinds, such as indexes, after the Parisian fashion, have utterly failed, because they gave the public some very trifling trouble; and when that is the case, such expedients never succeed. The plan adopted now partakes somewhat of the nature of a secret police. The managers of both companies employ indi-

viduals—whom they ascertain to be quite unknown to their servants—to ride occasionally in their omnibuses; and—without exciting notice—to take an account of the number of passengers. At the end of the trip the individual so employed sends a sealed memorandum to the company's office of the money which ought to be forthcoming, and if this do not agree with the account rendered by the conductor, an investigation takes place. Should a conductor be detected in one or two 'mistakes' of this kind, he is discharged. Of course the same individual cannot be long employed in this supervising office, or his or her person would be known; hence the company constantly change their spies, who are chiefly mechanics, sempstresses, or servants out of employment. Some, however, manage to retain the office, by great skill in disguising themselves. To-day one of these knowing passengers will make himself appear like a foreigner with mustaches; tomorrow he will be a carpenter, with a rule peeping out of his jacket; the next a gentleman's servant; and so on. It is gratifying to be able to add, on the authority of the secretary of the London Conveyance Company, that instances of detection very seldom occur. It is only when one conductor habitually renders a lower account than those of his colleagues who immediately precede and follow him on the road, that the secret system is employed against him. It has one good effect in his favour; providing he be found always correct, suspicion is removed, and his honesty better established. This kind of check is more or less adopted by all the London omnibus proprietors.

Besides these two companies, a third association of proprietors exists at Paddington, whose vehicles intersect various parts of London at right angles to those above-described. Starting from Paddington and travelling across the bridges, most of them end their trip at the Elephant and Castle at the head of the Kent road in Surrey, where coaches of all descriptions 'most do congregate.' Of these vehicles there are forty-eight, with an adequate establishment of men and horses to 'work' them. Lastly, ten omnibuses belonging to Paddington are employed in running to and from the various railway stations. Paddington, therefore, may be considered as the centre of the system, for upwards of 195 omnibuses daily ply from that suburb to various parts of London.

We now turn to the other great thoroughfares through which omnibuses ply. Besides the New Road and the line of streets beginning with Nottinghill, continued through Oxford Street, and ending with Cheapside and the Poultry—the third great east-and-west artery is that formed between the head of Sloane Street, in Knightsbridge, and Piccadilly; thence, by Charing-Cross, through the Strand, Fleet Street, Ludgate Hill, and St Paul's Churchyard, where it joins the middle route in Cheapside. This thoroughfare is crowded with omnibuses at all times of the day, not one of them limited to the length of road we have described, but all of necessity traversing it to arrive at their several destinations. For instance, at Sloane Street there is a meeting of three roads; one, commencing at the street itself, leads to Chelsea, from which at least twenty omnibuses ply; the second leads through Brompton to Fulham; the third, and by far the most frequented, intersects Kensington, Hammersmith, Turnham Green, Brentford, Isleworth, and Hounslow; whilst cross-roads over Hammersmith or Kew Bridges lead to Richmond. Each of these places has a set of omnibuses of its own, and all the vehicles pass the end of Sloane Street, and travel over the same ground till they get to the Bank, where some of them stop, whilst others continue the same line to Whitechapel turnpike, to Stepney, Bow, and other places in that direction, or branch off to the Blackwall railway-station, to Poplar, the West India Docks, and to Blackwall itself. On this road is, we believe, the longest omnibus journey in London: it extends from Brentford-end to Whitechapel gate, and is thirteen miles long, the fare for which is only one shilling, or not a

penny per mile. Few persons, however, require to ride that distance, and, to use a phrase of the road, 'the short passengers pay for the long ones,' though, for small distances, only sixpence a-head is charged.

Where the journeys of most of the west going omnibuses end, that of many of the east, south, and north ones begin—namely, within a short distance of the Bank. The well-known 'Flower-pot' in Bishopsgate-Street-Within, is the nucleus of the Hackney, Homerton, and Clapton 'buses;' whilst those whose route branches off towards the left at Shoreditch Church supply vehicular accommodation to the denizens of that road which John Gilpin has made immortal; for it leads through King'sland, Shacklewell, Stamford Hill, Tottenham, to Edmonton. In an opposite or southerly direction a succession of omnibuses ply between Gracechurch Street over London Bridge to Newington Butts, Kennington, Brixton, Stockwell, Clapham, and Tooting; or branching off at the far-famed 'Elephant and Castle,' make their way to Walworth, Camberwell, and Peckham. Some go by a third road so far as Greenwich, though most of the vehicles that ply to that place start from Charing-Cross. Their trade has, however, been all but abolished by the steamboats and railway. The plan of proprietors clubbing together, as at Paddington, has been successfully followed out in others, especially on the western roads.

The next great omnibus station is Islington. The vehicles in this quarter convey the public between Highgate, Holloway, Hornsey, Highbury, Islington, and Balls Pond, east to the city; or else, intersecting London in an opposite direction from the well-known Angel Inn, travel between the above places south-west to Charing-Cross. Most of these belong to unassociated proprietors, among whom, it is disagreeable to add, a fierce opposition is at present raging; one of the belligerents is, too, a lady—the largest private proprietor of 'buses' in London. Another north and south route is that between Camden and Kentish towns, Charing-Cross, and Lambeth. This is intersected by the Hampstead and Bank road, upon which omnibuses regularly ply.

We have now traced, so far as we can remember, the chief routes taken by the London omnibuses. By reference to the licensing-office, we learn that the number of stage-carriages plying in and from London was, during the year ending on the 4th of last January, 1472. As 'short' stage-coaches have been, except in very rare instances, abandoned, and as the railways have driven off all the 'long' ones from the road except not quite fifty, it is believed that the number of omnibuses plying about the streets and suburbs of London in every direction all day long amounts to at least 1400. At a rough calculation, some £2000 per day is spent in omnibus fares, making £730,000 per annum.

Having spoken so much of the vehicles, a word or two concerning the drivers and conductors may not be amiss. It cannot be concealed that for a long time these men were looked upon by the public with aversion, sometimes with dread. 'In the heat of debate' with opposition drivers, they used the most revolting language, and even conducted themselves towards their unoffending customers with extreme rudeness. The rate at which they sometimes galloped through crowded streets caused fatal accidents, and so great was their haste in getting passengers in and out, that falls and broken limbs were of continual occurrence. They thought nothing of taking an unprotected female to Whitechapel when she wanted to go to Islington; and we were once asked in a Brentford omnibus by a stranger from the country, 'Whether the Bank of England was much further out of town?' In short, to so great an excess were the offences of these men carried, that the legislature was obliged to interfere, and by the 6th and 7th of Victoria, cap. 86, all conductors and drivers of stage and hackney-carriages are obliged to be personally licensed. That there may be no difficulty in bringing offenders to justice, each man is registered with a number

against his name at an office for that special purpose, and that number is delivered to him legibly inscribed on a metal ticket, which he is bound under a penalty to display conspicuously about his person. He is also provided with a printed license. Should he misbehave himself, all that the injured party has to do, is to apply to a police-office for a summons against 'number so and so,' and the real culprit is sure to be found. In case of conviction, his printed license is endorsed by the magistrate with a statement of the penalty, and besides that, a list of stage-carriage offences is forwarded from the police-offices to the registrar every quarter. The license is renewable every year in May, and if the man be found unworthy of a fresh one, it is refused.

This plan seems to have acted in a most salutary manner. The drivers and conductors are now a different set of men; our own experience of them of late is diametrically opposed to our recollection of the class half-a-dozen years ago. As a body they may be described as civil, obliging, and well-mannered men. This reform, however, must not be wholly attributed to the act of parliament, to which the public is much less indebted than to the directors of the London Conveyance Company, who set the example of employing and encouraging the civil and well-conducted.

As may be expected, the number of conductors and of drivers in London nearly corresponds with that of the omnibuses. In May 1844 there were licensed 1854 conductors and 1740 drivers. Deduct those employed on the few short stages, and for about 300 individuals who took out licenses both as drivers and conductors, and the numbers as above stated nearly correspond.

THE SISTERS*.

BY MISS ANNA MARIA SARGEANT.

Oh what a goodly outside falsehood hath.—*Merchant of Venice.*

In one of the villages situated near the coast, in the beautiful county of Devon, stands, or rather stood, a small villa-like abode called Gothic Cottage. At the period when my narrative commences it was the residence of two sisters, the daughters of an officer in the army, who, nearly forty years previously, had retired there to spend the residue of a life, the early part of which had been engaged in active service. Captain Ramsay was yet a young man when disabled by a wound in his right arm, and consequently forced to retire on a pension. He had twice entered the marriage state, and Mary, the daughter of his first wife, was sixteen years the senior of her sister. The first Mrs Ramsay was an estimable but uneducated woman, who had been the captain's devoted nurse in a season of great bodily suffering, and to whom he offered his hand under the influence of feelings of gratitude and esteem. Unlike the general experiences of unequal marriages, he never had reason to repent of his choice. His second partner was the daughter of an old messemate who had taken up his residence in the neighbourhood. But brief was the period of his conjugal felicity with this lady: she died a few days subsequent to the birth of her first child, and so overwhelmed was the peculiarly sensitive mind of the husband by this fresh blight to his hopes of happiness, that a rapid decline soon brought him also to the grave.

The situation of the young orphans had attracted general sympathy in the neighbourhood, and Mary,

* The principal features of this little narrative recurred to the writer's recollection on the perusal of an article in the *Journal of August 12, 1843*, titled 'Credentiale,' and she has woven them into a tale, thinking that they would illustrate the truthful observations there made.

being known to be expert with her needle, was offered a situation as sempstress, and advised to write to the late Mrs Ramsay's relatives, who were residing in Ireland, requesting that they would relieve her of the care of the little Eveline, or at all events provide for her support. This proposition, however, accorded not with her ideas of duty. Affection was the most striking feature in Mary's character, and now that both her parents were taken from her, its whole strength and intensity seemed centered in the motherless infant thus thrown upon her regard. She positively refused to part from the child, and, young as she was, resolved to be her future protectress. The nurse, who since Mrs Ramsay's death had taken charge of her, would, she said, still remain with them, and they should be able to live upon the remnant of her father's property, aided by her exertions with her needle, for which she would endeavour to find employment at home. This noble resolve was looked upon as utterly chimerical even by her best friends, who thought it incumbent upon them to point out the difficulties which must attend the pursuance of such a plan; but our young heroine's resolution was not to be shaken, nor was it the mere impulse of a generous nature, called forth by the circumstances of the present moment. She shrunk not from the self-denial which the fulfilment involved, but persevered with a steady undeviating constancy, which excited the admiration of all. With the dawn of morning Mary's nimble fingers might be seen plying the needle, and in the twilight she was still at her task. So much commiseration and esteem did her conduct call forth, that she was never without employment. Her only recreations were the caresses of her little charge, who fondly loved, though she was too young to comprehend how much she owed to her.

Thus the early years of Eveline Ramsay glided away, and, to the great delight of her youthful protectress, she gave promise of being gifted in mind, as well as eminently beautiful in person. This discovery, however, was to Mary a fresh source of anxiety, for she felt an eager desire that her sister's talents should be cultivated. Her own limited knowledge incapacitated her for undertaking her education, could she have found leisure for the task, and no increased effort on her part could supply the large sum which would be requisite to pay the expenses of tuition. Just at this juncture, she, to her unspeakable pleasure, received an altogether unexpected legacy from a distant relation of her mother. This sum was designed by the donor as a provision for her own unprotected youth, but she unhesitatingly appropriated the principal part of it to the education of her young charge, who now became a day pupil at a large boarding-establishment in a neighbouring town. Such a line of conduct would, she thought, insure to Eveline a genteel means of support in the event of her own removal. But unhappily this mental culture not being rightly directed, had the effect of inducing Eveline to believe that there was some superiority in herself which demanded a sacrifice on the part of Mary. There was a striking difference in the appearance of the sisters. Mary's form and features were of a homely cast, and her manners had none of that polish which education gives, yet it was impossible to behold her without admiring the placid and benevolent expression which pervaded her whole aspect. Eveline, on the contrary, possessed a face of delicate beauty, and a form of perfect symmetry; and so proud was the fond but misjudging Mary of that beauty, that she would not suffer her fingers to be soiled by any homely occupation, and was con-

tented to wear the plainest apparel, that her sister might be arrayed in the manner she deemed suitable to her rank in life. Had the judgment of the devoted girl been as sound as her affections were strong and her spirit self-sacrificing, she would have pursued a different course.

Several eligible offers of marriage had been made to Mary by the farmers' sons in the neighbourhood, who had sufficient good sense to appreciate her character; but she resolutely refused to accept of any, though it was thought that one youth had made a serious impression upon her heart. She would never, she said, desert the charge she had undertaken; her life should be devoted to sisterly affection; and though her friends grieved to see her thus sacrifice her happiness, they could not but admire the motive from which it sprang. At the age of sixteen, Eveline discontinued her attendance at school; but her sister's labours were not in consequence lightened, her time being now principally occupied by reading and drawing. For the former amusement she selected exclusively the extravagant novels which then poured from the press, exorbitantly taxing her sister for the means of procuring them, and inflaming her own imagination by their perusal. Mary made still further sacrifices to gratify what she supposed to be an intellectual taste, not knowing that she was thereby administering a poison to the mind of her sister, which it would be impossible afterwards to counteract. Thus Eveline lived in an ideal world, and thought of the future as a golden dream which would realise all she had read of. Her peculiar position, her euphonious name, her delicate beauty, and her habits of luxurious indolence, all combined to make her believe herself to be a heroine of romance, and she confidently expected that her destiny would correspond with that of some one of the characters with whom she had of late become so conversant.

'When will you put off that everlasting brown stuff dress?' Eveline exclaimed a little pettishly, as the sisters were one Sunday morning dressing for church. 'You really are getting so prim and old maidish, no one would take you to be my sister,' she laughingly added, as she surveyed her own beautiful form, clad in rich attire, in the mirror before her.

'If I had afforded myself a new dress this season, I could not have purchased that one for you, Eveline,' was Miss Ramsay's mild reply.

'Well, but I really believe that you would rather wear that old dingy thing than a new one; you have such odd tastes and fancies. I declare we are as unlike as though one of us had been born at the antipodes: we have not one desire or pursuit in common.'

'Nay, I hope we in common desire to do our duty, and to love one another,' Mary smilingly interposed.

'True; but our ideas upon even those subjects are dissimilar, like everything else,' returned the volatile girl. 'Duty with you, Mary, means to attend to the domestic matters, and you have certainly a genius for the culinary art.'

'And for the dressmaking art too, I think you will allow,' her sister archly observed; 'for you are occupied in admiring the fit of that dress instead of putting on your shawl.'

'Yes, I admit that you are very clever with your needle too,' she rejoined, still keeping her position before the glass. 'Now, my duties lie in a different line. It is my part to give the refinement of taste to our little home.'

'You confess, then, that my accomplishments are the most useful, if yours are the most refined,' Miss Ramsay observed, gathering and folding as she spoke the scattered articles Eveline had thrown off.

'Why, we could not live entirely upon books and pictures, or ornamental work. Still I cannot admit that your occupations have the superiority you imagine, inasmuch as they are of a grosser nature.'

'We will decide this point another time,' said the elder sister; 'meanwhile let us each fulfil the duties which lie straight before us, be they mental or manual.'

'Dear Mary,' asked Eveline abruptly, after a short pause, during which she had completed her toilet; 'dear Mary, is it possible that you have reached the age of three-and-thirty, and never fallen in love?'

Mary's colour rose. 'Silly girl,' she said; 'why ask such a question just now? Your thoughts ought to be differently occupied.'

'Nay, but the idea just occurred to my mind, and I shall not rest till I know.'

'Then I am afraid, Eveline, that it will be a long while before you rest; for I don't think it prudent to talk on such a subject to one so young as you are.'

'Young as I am!' she repeated; 'why I am verging on seventeen, and every young woman falls in love at that age.'

'None but foolish young women do so,' Mary laughingly returned.

'Now that is your prudish, old-maidish idea,' said Eveline; 'but I can tell you, my sage sister, that it is useless to preach when the mischief is accomplished, for I am about to introduce to you a gallant cavalier, who has already done me the honour of laying his hand and fortune at my feet.'

Mary gazed in her sister's face as if to demand if she were in jest or earnest. Her lips moved, but her tongue could find no word of utterance, so intense were the emotions which agitated her breast.

'Why, you really look frightened,' Eveline continued. 'Is there anything so very surprising or shocking in the affair? But perhaps,' she added with mock gravity, 'I ought to have consulted my elder sister ere I suffered the urchin Cupid to aim his arrows at my vulnerable heart.'

'This is too serious a matter to be treated with levity, Eveline,' Miss Ramsay at length articulated. 'If you mean what you say, tell me, I conjure you, of whom do you speak?'

'I cannot pretend to give you the gentleman's pedigree,' the young lady replied; 'but in answer to your interrogation I can inform you that his name is Henry Woodville—that he is a man of family—that he has a large estate in prospect—and that he is the realisation of my dreams of a lover.'

'And where did you meet with him?' Mary asked in breathless agitation.

'Why, just where one would wish to meet with a lover—as I was sitting on a grassy knoll, beneath the shadow of a wide-spreading oak, whilst I was engaged in sketching our cottage at a distance.'

'You must not again walk abroad alone, Eveline; it is unfitting at your age.'

'Nay, you need not caution me on that head; I shall for the future have a companion in Mr Woodville, for he intends stopping in this neighbourhood for some months, he says. He tells me he loves retirement.'

'You must not permit him to be your companion,' cried Miss Ramsay in alarm. 'You are too young to act for yourself, and must be guided by my advice. If your suitor intend honourably, he will not shrink from being introduced to me, and visiting you here, and I shall then be better able to judge whether he is a fitting husband for you.'

'You shall see him this very day,' she gaily returned. 'He said he should meet me at church, and I bade him join us on our return, when I promised to introduce him to my sober sister. It was for that reason I wished you to put off that old brown gown, and don something smarter.'

'You treat this matter too lightly, Eveline,' cried Mary, whilst her usually placid features exhibited the agitated state of her mind; 'I shall be on the rack till I know what is likely to be the end of this affair.'

'I can tell you, then, in a sentence,' she laughingly made answer: 'the end will be a marriage, a coach and

four, and, it may be, a title; for he tells me there is only a sickly cousin in the way between him and a baronetcy.'

Mary did not speak, but her heart was full of anxiety. It must be confessed that she heard little of the sermon that day, her thoughts being too much engrossed by the recent conversation.

As Eveline anticipated, they were joined on their way home by the lover. He was a tall, fashionably-attired young man of about six-and-twenty, possessing gentlemanly and even fascinating manners. A visit on the morrow succeeded, when the suitor gave to the elder lady a full explanation of his present circumstances and his future prospects. He had, he said, no proud or avaricious father to object to his union, and the estate now in litigation would, without doubt, be very shortly at his own disposal. Miss Ramsay was too little versed in the ways of the world to entertain a doubt of the truth of his statements. Her only objection arose from Eveline's extreme youth; but she was won to sanction the young man's visits, though she strongly protested against all thoughts of a union till at least three years had elapsed, at the expiration of which period the young lady would still be only twenty.

The lover was obliged to acquiesce in this decision, though it was with evident reluctance; and as the object of his visit to Devonshire was, he said, recreation, he declared his intention of remaining in the neighbourhood, instead of, as he had at first purposed, proceeding to explore the beautiful spots for which that county is celebrated. His time was now almost wholly spent in the society of the sisters, for Mary wisely put a negative to Eveline's rambles unless she were her companion. He read with the younger the impassioned works of which she was so fond, or chose subjects for her pencil, whilst the elder was engaged with her needle or pursued her domestic avocations.

Two months thus glided away, when one morning Woodville informed them that he had received a letter apprising him that his affairs required his presence in town. He hoped, he said, that he should shortly be able to return with the agreeable intelligence that the lawsuit was at an end and the estate his own. These remarks were made in the presence of Miss Ramsay; but having contrived to obtain a subsequent interview with Eveline, he, in eloquent and impassioned language, declared life to be insupportable without her, and so vehemently urged a clandestine flight and an immediate marriage, that she in a moment of weakness was induced to consent.

Woodville took his leave early in the evening, professedly to return to London alone, and the sisters parted after supper as usual, only that the younger clung around the companion she was about to desert with a closer embrace than she was wont. 'Heaven bless and prosper thee, my darling,' was Mary's affectionate benison as she stood a moment and looked after her young charge. The words rung in the ears of the conscience-stricken girl. 'Alas! I cannot ask the blessing of heaven upon my actions,' she exclaimed, as she threw herself into a chair; 'I am violating every tie of nature and affection; I am forsaking and giving pain to one who has been to me as a mother.' But when, after these reflections, she thought of Woodville and of the earnestness with which he had besought her to accompany him, her scruples gave way, and she was again the sport of passion. She was, she thought, but fulfilling her destiny. Her fate was to be singular, but the end, she confidently hoped, would make amends for all the trials she must undergo. With these fallacious reasonings she consoled herself, as she made preparations for her journey, and attired herself in a travelling dress. Hastily taking up a pencil, she wrote a few words of apology and farewell to her sister, when, her watch giving notice that it was within five minutes of the hour of assignation, she stepped gently down the stairs. With a palpitating heart she passed the door of Mary's chamber, and listened for a few moments to ascertain if she were yet in bed. She knew that she

not unfrequently sat up even after midnight to finish some piece of needlework; but all was now still, and hoping that she was asleep, she proceeded, and was in a few minutes by her lover's side. A chaise was in readiness at a short distance, and she suffered herself to be led to it without daring to cast one more look upon her early and happy home.

The flight of Eveline was not discovered till the usual hour of breakfast, when she was missed from her accustomed seat. Fearful that the delay arose from indisposition, Miss Ramsay hastened with some anxiety to her chamber; but great was her surprise and alarm when she found it vacant, and that her bed had not been occupied that night. The scrap of paper on the dressing-table catching her eager eye, she seized it with breathless haste. 'Dearest Mary,' she read, 'my more than mother, pardon the hasty step I have taken, and think the best till you hear from me, which you soon shall do as Eveline Woodville.' Miss Ramsay stood like one who doubted the evidence of her senses. When the dreadful certainty took full possession of her mind, she threw herself into a chair, and gave vent to a flood of tears. 'Is it for this I have cherished her these seventeen years?' she exclaimed; 'is it for this I have laboured so unremittingly, to be deserted for an acquaintance of a few days? Oh, Eveline, you have almost broken the heart that loved you so dearly. He will never love you as I have loved you,' she passionately added, rising and pacing the room with rapidity, as if to fly from reflections which were too harrowing for endurance; 'rash, foolish girl, you will repent this step!' But this burst of anger over, the unhappy young woman began to question whether she had not herself acted an indiscreet part in suffering her sister to receive the addresses of a person of whom she knew nothing excepting from his own testimony. The most dreadful fears now assailed her lest Woodville, if correct in his statements regarding his family connexions, might not intend honourably. The fact of his enticing Eveline to quit her home clandestinely, seemed to corroborate this horrible idea. Again, if it were not true that he was the person he represented himself to be, though his motives in marrying Eveline could not be mercenary, yet he must be some worthless adventurer; and cheerless was the prospect with such a companion, more especially for one who had never yet known affliction in any of its forms. She could not help reproaching herself that she had not before taken these things into consideration; nay, she went further; she condemned herself for the injudicious training she had given her sister, which had, she feared, led to the evil she deplored.

At the expiration of three days, Miss Ramsay received a letter from Eveline, containing the information that they had arrived safely in London, and the marriage ceremony having been performed, that they had taken up their residence for the present in Westminster, at the house of a widow lady, who was an old friend of Mr Woodville's. She concluded with reiterated assurances of affection, and supplication for pardon; and Mary, whose affectionate heart could not long entertain anger against one she had loved so fondly, wrote an immediate answer expressing her forgiveness, and the most tender interest in her sister's future welfare. Feeling somewhat better satisfied, she now strove to compose her mind, and resume her accustomed avocations; but the pleasure she had before experienced while engaged in their performance was over. She was happy, however, in her ignorance, compared with what she would have been had she been acquainted with Eveline's actual situation. The home of which her sister spoke was a miserable floor in a large lodging-house, in one of the most densely populated parts of London, and the widow lady was a coarse vulgar woman, from whose manners she shrunk with disgust; yet, even amid these discouraging circumstances, she was willing to hope that a brilliant career was yet in store for her, and her letters were full of anticipations. But when month

after month passed away, and the same tale was told without any advance being apparently made, Mary began to fear that the whole would prove a delusion.

A fresh source of anxiety now arose from the intelligence that Eveline was likely to have the cares of a mother added to those of a wife, and the information came accompanied by a request of a small loan, to enable her to make the necessary preparations. The next letter was from Woodville. In terms fair and smooth, he represented his deep regret that the settlement of his affairs had been so long delayed, adding, that if she could accommodate her sister with a further remittance to save her and her infant from want in their present exigency, he should shortly be able to repay her. To the generous breast of Miss Ramsay such appeals were never made in vain, though she could not help thinking that a young man of Woodville's education and address ought to make some effort to support his family, and not depend upon the precarious termination of a lawsuit. This was, however, but the commencement of a system of robbery under the garb of borrowing, which kept her in such a state of poverty that she was herself often obliged to suffer privations of the common necessities of life; and what gave her even more pain was, she could not raise funds to pay the expenses of a visit to London, though she most ardently desired to do so. The letters of Eveline to her sister were now less frequent, the alleged cause being that her infant engrossed so much of her time; but the truth was, her confidence in her husband was shaken, and she could not bear to make known to that beloved and injured relative the dreadful apprehensions she herself entertained, that he had cruelly deceived them by false statements regarding his family and position in society. Some observations not intended to meet her ear, which were made in the adjoining sitting-room whilst she was confined to her chamber, gave her good grounds for suspecting the landlady to be her husband's mother. She heard her reproach him in the most bitter terms for adding to her cares by bringing home a wife who was too much of a lady to wait upon herself, and further tax him with curtailing her comforts for her maintenance.

The feelings of the unhappy young wife upon this discovery may be imagined better than they can be described, yet she dared not give them vent. The confession of her knowledge of the deception would, she thought, irritate the temper of Woodville, who had of late grown very petulant, and she dreaded still more the virulence of the mother's tongue. Even when she intended to treat her with civility, Eveline had shrunk from her attentions; her vulgar expressions disgusted, and her familiarity offended her. Often had she wondered that a gentleman of Mr Woodville's birth and education should ever have been on intimate terms with such a person; and that her husband, though he could not do otherwise than surmise what was passing in her mind, should offer no explanation. Now the mystery was solved, so far at least as the intimacy between the two parties was concerned. But what a prospect did it open to the unfortunate young creature who had thus cast herself upon their mercy!

This was, however, but the commencement of Eveline's trials. Hitherto the hope of a brighter future had supported her; and even under the possibility of a failure, she had consoled herself by the alliance her heart reposed in—the object of its fondest regard. Now it was otherwise. What had she to expect from a man who could act in so unprincipled a manner as her husband had done? What but wretchedness and ultimate neglect. Her forebodings of evil were but too true. The birth of her child, instead of strengthening the bond between them, served on the contrary to sever it, for it formed a plea for Woodville's continually absenting himself from his home. This unnatural conduct called forth angry feelings on Eveline's part, and the result was still further disregard for her comfort on his. She accused him of having enticed her from the peace-

ful and happy abode of her youth, and he recriminated with equal bitterness; and thus another six months passed away. The change from the healthful spot in which Eveline had been born and reared, to the closely pent up rooms she now occupied, added to the distress of mind she suffered, had, as might be expected, a powerful effect upon her naturally delicate frame, and symptoms of incipient consumption were the consequence. Her figure lost its beautiful proportions, the soft bloom on her cheek was superseded by a hectic flush, and the brilliancy of her deep blue eye was destroyed by constant tears. But he who had been the cause of this premature decay felt no stings of conscience for the part he had taken, nor even deemed it incumbent upon him to make a show of tenderness he evidently no longer felt. The love he had at one period so ardently professed had been called forth by the dazzling beauty for which she was once distinguished—it was not of a nature to stand the test of time.

The distresses Eveline endured were of necessity aggravated by the fact that they were self-inflicted, and bitterly did she now repent the rash step she had taken; yet she could not allow herself to make these admissions to her sister, though upon that sister's bounty it was that she still existed.

Affairs were in this unpromising state, when one cheerless evening at the latter end of autumn, after having seen her child quietly asleep, she sat down, intending to pen a few lines to Mary, in answer to a letter full of anxious inquiries which she had received in the morning. The fire, which she had not the means to replenish with fuel, was expiring in the grate, and the little candle, before which she bent her faded form, cast a faint light over the large but scantily furnished apartment; but so powerfully were the feelings of the neglected young wife wrought upon by the loneliness of her situation, that she sat and wept instead of fulfilling her task. 'Oh my sister,' she passionately exclaimed, clasping her hands together as she spoke, 'could you behold me now, how would your affectionate heart bleed at the sight; but you are spared the misery, and it is well; I have already heaped too much upon you.' A quick step upon the stairs, and the sudden opening of the door, here aroused her. She turned abruptly, dreading she knew not what, when the appearance of Woodville in an excited if not intoxicated state increased her alarm.

'Are you writing to Devonshire?' he demanded, seeing the materials for her letter lying on the table before her. 'I trust you are about to ask a further supply of money, for it is out of my power to support you any longer,' he bitterly added.

'What do you mean, Henry?' asked the young wife in breathless agitation.

'I mean,' he doggedly rejoined, 'that this day has settled my long-contested claim to the estate, and it is decided against me.'

Eveline looked at him in amazement. She had long considered the story of the lawsuit as a fabrication, but the apparent sincerity of his manner now awakened a doubt whether it were not the truth.

'You look stupified, girl,' he pursued; 'but this is no season for delay; you must pack up all we possess within a quarter of an hour, when I shall return with a vehicle to convey us from here, for we are no longer safe beneath this roof.'

'Are you in earnest, Henry?' she asked, so bewildered that she scarcely knew how to perform the task he had assigned her.

'Earnest!' he fiercely repeated. 'Is this a time for jesting, when an hour's delay may find me in prison?'

'Oh, Woodville,' exclaimed the unhappy girl, throwing her arms around him in a paroxysm of grief, 'you know that I have lived for these eighteen months upon the hope of the favourable termination of this lawsuit. You know that for love of you I left a happy home, where I knew not want or sorrow, and where, for seventeen years, I was never addressed but with words of

tenderness. But I now aver, and Heaven is witness to my words, that I will follow you to beggary or to prison if you still love me and treat me with the kindness you were wont to do.'

'Foolish woman,' he muttered, putting her from him, though there was less harshness in his tones; 'this is no season for romantic scenes, those days are over; do as I bid you, as you value my safety.' And as he spoke he abruptly quitted the room.

In a state of excitement which gave her strength for the performance of the duty he had imposed upon her, Eveline collected her apparel together, and was ready by the appointed time. Mrs Jackson assisted in carrying down the luggage, whilst the unhappy wife, though totally ignorant of where she was going, caught up her still sleeping infant, and folding it within the cloak with which she was herself enveloped, followed down the stairs. A hackney-coach stood at the door, into which Woodville almost forced her, so eager did he appear to depart; then, after whispering a few words to the driver, he seated himself by her side, and the vehicle drove off with the utmost rapidity.

A few days after the above related events took place, a letter, bearing Eveline's signature, was put into the hands of Miss Ramsay, but so illegible were the characters, that she could scarcely believe them to have been penned by her. The sad information it contained was expressed in the following incoherent and passionate words—'Haste to me, my beloved Mary. Haste to me as you love me, if I have not so robbed you that you cannot raise sufficient money to pay the expenses of the journey. Nothing but your presence can comfort me or save me from self-destruction. I am deserted and alone. He for whom I forsook my only earthly friend has left me—left me penniless and without sustenance for the innocent little creature who is my companion in misery—amongst strangers, who look on me with suspicion. You will come to me, my sweet sister; I am sure you will come; your heart was never shut against me, and your forgiving love will pardon your erring but ever affectionate Eveline.'

Miss Ramsay, with that self-denying affection for which her character had ever been distinguished, was in less than an hour on her way to London, laden with a variety of those little comforts which she thought might be acceptable to her suffering sister. She found her occupying a miserable garret in an obscure part of the eastern suburbs, and so changed in person that she could scarcely recognise her. The meeting, on Mary's part, was characterised by tenderness and concern; on Eveline's by penitence and gratitude. 'Oh, my sister,' cried the latter, as she fondly clung around that beloved relative, 'I little thought when last I held you thus, that our next meeting would be in such a home and under such circumstances. But I deserve it all; I have brought upon myself all the misery which I suffer. But it is my greatest grief that I have involved you, dearest Mary, in my ruin.'

'Cease to reproach yourself, darling,' cried Miss Ramsay affectionately. 'You require peace of mind, and then your health will, I trust, amend. You must return with me to our once happy home, and we will try if we cannot find it such again.'

'Never, never,' Eveline energetically interposed. 'I could not endure a return. I could not meet the eyes of those who were wont to look on me with envy, humbled as I am. No; I must bury my sorrows and my shame in secret. Oh Mary,' she wept forth, as she hid her pale face upon her sister's bosom, 'it is perhaps too much for me to expect of you to give up your home for my sake, after the part I have acted towards you; but I cannot—no, I cannot return with you.'

'There is no sacrifice I would not make to save you a pang, dearest Eveline,' Mary tenderly rejoined, straining her sister's wasted form in a still closer embrace. 'I will let the cottage, and we will take up our abode in London, if it will make you more happy; and I will try to obtain some employment which will afford us a

means of support. But you must promise me that you will strive to recruit your health and forget the past.'

'I will promise anything—anything but to return to Devonshire,' Eveline passionately exclaimed.

Before going further, it may be proper to state that the person styling himself Henry Woodville was in reality a mechanic's son, who, having received a tolerable education at a public school, and possessing a handsome person and good address, had formed the determination of making his fortune without giving himself the trouble of attaining it by his own exertions. An advertisement in a newspaper, purporting that a young man of that name who had left his family clandestinely when a boy, was heir to an immense estate, then lying in the hands of executors, suggested to him the idea of personating the runaway; and his previous knowledge of some particulars respecting the family of which he professed to be a member, favoured this deception so far that one of the executors espoused his cause from the conviction of its legality. The other, a shrewd man of business, suspecting the truth of his statements, delayed the decision from month to month. Meantime the real heir, who had been abroad, made his appearance. The pending litigation was then quickly terminated, leaving the hero of this story in danger of being apprehended as an impostor. He had, as we have seen, sought refuge in obscurity, but that proving insufficient to protect him, he was ultimately obliged to leave his native country for America.

Miss Ramsay removed her sister to some more comfortable apartments, where she trusted that careful nursing and the soothing tenderness of affection would re-establish her health. This done, she began to consider in what manner it would be best for her to endeavour to procure a maintenance. She suggested that they should open a little school, in which occupation Eveline could assist, whilst she added to her own duties the employment which had for so many years afforded them a livelihood. Eveline was eager to accede to any proposition made by her sister; but when the actual duties lay before her, she shrunk from the task. Never having learned perseverance, she was unable to exercise it at this juncture, when her weak state of health rendered it really difficult. The pursuit of an occupation, which would necessarily prevent her mind from dwelling upon her misfortunes, would have tended to heal her mental malady; but when Mary saw that the effort was painful to her, she, with mistaken kindness, insisted on taking the whole of the duties upon herself. Finding that the change did not effect the restoration she had hoped it would have done, Miss Ramsay now called in medical aid. Her native air was prescribed as the most effectual means of saving the invalid from an early grave; but Eveline was resolute in her refusals to return to Devonshire, protesting that instead of accelerating her recovery, it would hasten her end. The yielding mind of Mary acquiesced in her decision, but it was with many secret tears; and she too late discovered and bitterly regretted the error she had committed in the education of her youthful charge, in never having suffered her to be disciplined by that salutary contradiction which prepares for an adverse hour.

The winter passed away, and the return of spring gave some hopes to the fond sister of the invalid's recovery; but it was like the bright but evanescent light which emanates from a lamp just as it is about to expire, and before the summer brought her nineteenth birthday, Eveline was in her last resting-place. Miss Ramsay now returned with her infant niece to the cottage where her mother had been reared, there to cheat the remembrance of her griefs in commencing anew a life of self-sacrificing devotedness. But how different were her feelings as she reared her second orphan charge! Experience had taught her a lesson of wisdom—a lesson she could never forget. Many years have passed since the little Eveline first became an inhabitant of Gothic Cottage, and it has since dropped

to decay. She is now a wife and mother; not as her unhappy parent had been—deserted and wretched, but the personification of health and happiness; and Miss Ramsay, or 'Aunt Mary' as she is always termed, though decidedly what the world denominates an 'old maid,' is still actively useful, shedding the beautiful halo of her undying affection around a third generation, and enjoying a rich reward in the felicity she confers.

OCCASIONAL NOTES.

THE ATMOSPHERIC RAILWAY.

We observe that the parliamentary committee have recently made their report respecting the merits of the atmospheric railway. Their verdict, contrary to the expectations of some, is decidedly favourable to the new principle, and leaves it, therefore, to a fair and unfettered competition with the locomotive now generally in use. While, however, they express a strong opinion in favour of its general merits, they distinctly state, 'that experience can alone determine under what circumstances of traffic or of country the preference to either system should be given.' This is quite as the matter ought to be; for nothing could be more hurtful to that ingenuity and skill which has raised our mechanical power to its present pitch than legislative interference. The freer the spirit of inquiry, and the more accessible the way to its application, the sooner will it correct its own blunders and arrive at precision and truth.

As is well known, the Dalkey and Kingstown line, near Dublin, is the only one yet laid down on the atmospheric principle; and this, as a matter of course, taken in connexion with the opinion of eminent engineers, forms the basis upon which the committee have founded their decision. 'This line,' say they, 'has been open for nineteen months, has worked with regularity and safety throughout all the vicissitudes of temperature, and the few interruptions which have occurred have arisen rather from the inexperience of the attendants than from any material defect of the system. Moreover, high velocities have been attained, with proportional loads, on an incline averaging 1 in 115, within a course in which the power is applied only during one mile and an eighth. These are important facts. They establish the mechanical efficiency of the atmospheric power to convey with regularity, speed, and security, the traffic upon one section of pipe between two termini; and your committee have since been satisfied, by the evidence of Messrs Brunel, Cubitt, and Vignoles, that there is no mechanical difficulty which will oppose the working of the same system upon a line of any length. They are further confirmed in this opinion by the conduct of the Dalkey and Kingstown directors, who have at this moment before parliament a proposition to extend their atmospheric line to Bray.'

In addition to the witnesses above mentioned, the committee had the advantage of hearing the objections of Messrs Nicholson, Stephenson, and Locke, against the adoption of the principle. These objections chiefly relate to the expense of keeping the atmospheric apparatus in an efficient state, and the inconvenience and irregularity attending upon a single line—there being only one exhausting tube laid down on the experimental line at Dalkey. To these objections the committee make a very unprejudiced reply. With respect to expense, 'it would scarcely be possible at the present time to institute a fair comparison between a system which has had fifteen years of growth and development, and another which is yet in its infancy; and as to the second point, 'the majority of engineers are decidedly of opinion that any ordinary traffic might be carried on with regularity and convenience by an atmospheric line.' These matters being disposed of, the following instructive remarks are offered in comparison of the two rival systems:—'Without entering upon all the controverted points, your committee have no hesitation in stating,

that a single atmospheric line is superior to a double locomotive line, both in regularity and safety; inasmuch, as it makes collisions impossible except at crossing-places, and excludes all the danger and irregularity arising from casualties to engines or their tenders.

'Your committee desire also to bring to the attention of the House a peculiarity of the atmospheric system, which has been adduced by the objectors to prove how unsuited it must be profitably to carry on a small and irregular traffic—namely, that the greatest proportion of the expenses of haulage on the atmospheric principle are constant, and cannot be materially reduced, however small the amount of traffic may be. This is, no doubt, a serious objection to the economy of the atmospheric system, under the circumstances above alluded. But, on the other hand, as the expenses do not increase in proportion to the frequency of the trains, it is to the interest of companies adopting the atmospheric principle to increase the amount of their traffic by running frequent light trains, at low rates of fare, by which the convenience of the public must be greatly promoted. Upon an atmospheric railway the moving power is most economically applied by dividing the weight to be carried into a considerable number of light trains. By locomotive engines, on the contrary, the power is most conveniently applied by concentrating the traffic in a smaller number of heavier trains. The rate of speed at which trains of moderate weight can be conveyed on an atmospheric line, makes comparatively little difference in the cost of conveyance; while the cost of moving trains by locomotive engines increases rapidly with the speed.

'Now, when it is considered that we surrender to great monopolies the regulation of all the arteries of communication throughout the kingdom—that it depends in a great measure upon their view of their interest when we shall travel, at what speed we shall travel, and what we shall pay—it becomes a material consideration, in balancing the advantages insured to the public by rival systems, to estimate, not so much what they respectively can do, but what, in pursuit of their own emolument, they will do.'

Experience can alone decide this as well as other matters connected with both systems; but from all we know and have seen of the atmospheric principle, we agree with the committee that there is ample evidence to justify its adoption. Its mechanical success has been perfect. 'I consider,' says Mr Bidder in his evidence, 'the mechanical problem as solved, whether the atmosphere could be made an efficient tractive agent. There can be no question about that; and the apparatus worked, as far as I observed it, very well. The only question in my mind was as to the commercial application of it.' Even Mr Stephenson, one of the hostile evidences, admits that, under certain circumstances of gradients, and under certain circumstances of traffic without reference to gradients, the atmospheric system would be preferable. Besides this, Mr Brunel has proposed to double the line in those places where trains are intended to meet; and has further shown, that in a hilly country, with long lines of sufficient inclination to allow of the descent of trains by their own gravity, it might be possible to effect this object without the expense of a tube.

Leaving then the subject of expense to the companies interested as a matter which experience will soon decide, we see nothing in the principle, either in point of safety, regularity, or convenience, which can at all militate against its adoption, while we believe there are several points that in certain situations render it decidedly preferable. For many districts in Scotland and Wales it would be highly advantageous, and all the more so that the down train could proceed by its own gravity, and even be brought to assist the motion in the contrary direction. In point of safety, a single atmospheric line has been pronounced as decidedly preferable to a double locomotive, and this of itself is a consideration not to be overlooked, though obtainable only by a greater expenditure.

MAYNOOTH.

The little Irish town of Maynooth is situated in the county of Kildare, remote from any large or important place. It consists of one long broad street, formed by comfortless-looking habitations, few of which deserve the name of houses, being mere cabins. At one end of this humble street is the entrance to Carton, the seat of the Duke of Leinster, and at the other are the ruins of Maynooth Castle, once the stronghold of the Earls of Kildare. Near to these ruins is a building which has the appearance of a recently enlarged gentleman's mansion: this is the Royal College of Maynooth, about which there has been so much talk of late. The site, and fifty-four acres of land around the house, were originally granted by the Duke of Leinster, upon a perpetually renewable lease, at the low annual rent of seventy-two pounds a-year. It is said that the purchase of the house and the various additions which have been made to it cost in all £40,000. The college was opened for the reception of students in October 1795.

Before that period, young Irishmen desirous of being educated for the Romish priesthood were obliged to go abroad for that purpose. Attached to various continental universities, colleges are founded for the exclusive use of Irish students, some of which are still in existence and operation. When war broke out at the end of the last century, it was of course impossible for those desirous of entering the Roman Catholic church to reach the proper colleges; hence it was found necessary to establish a place of education for divinity students in Ireland, and Maynooth was the place chosen for its site. The college is governed by a president, vice-president, dean, and procurator or curator; and the education of the students is under the superintendence of professors of the Sacred Scriptures, of dogmatic theology, moral theology, natural and experimental philosophy, logic, belles lettres, Hebrew, Greek, and Latin, English elocution, and of the Irish and French languages. The expenses of the college are supported by various sources of revenue and by private bequests, in addition to an annual grant from the British parliament of £8928. This sum, however, has been found inadequate to the expenses of the establishment, and it has been proposed to increase it to £26,000.

The buildings of this college, in its present state, are fitted for the accommodation of 450 students. Of this number, 250 are free students, who are selected by the bishops of the several dioceses at yearly provincial examinations. They pay eight guineas upon their entrance into the college, and that is their only expense. The rest of the students in the establishment are either 'pensioners,' who pay twenty-one guineas per annum and four guineas entrance, or 'half pensioners,' who pay only half that amount in a year.

The discipline is somewhat strict and impartially enforced. The students usually remain at the college for their period of study for five years. Two of these are devoted to humanity, logic, and mathematics, and three to theology; the course, however, is sometimes shortened by the omission of mathematics from the list of studies. The students rise at half-past five o'clock, and retire to rest at half-past nine in the evening, eight hours being thus allowed for repose. There are two months of recess in the summer, and a short holiday at Christmas, Pentecost, and Easter. It would however appear that these recesses are nominal, for to take advantage of them special permission must be obtained from the Catholic bishop of the diocese, from which each pupil has been selected. In fact very few of the students ever leave the college for a single day, from the time they enter it to their final departure. But once a-week they are allowed to walk in the grounds belonging to the establishment, and then only under the guardianship of the dean. There is in the college an excellent and rather extensive library, chiefly formed by bequests and presents, containing the choicest works in history, belles

lettres, arts and sciences. The students have not unrestrained access to them, their course of reading, even for amusement, being rigidly prescribed by their superiors.

CULTURE BY ELECTRICITY.

The stimulating effect of electricity on the growth of plants has been long suspected; a highly charged state of the atmosphere being always regarded as favourable to vegetable luxuriance, causing a healthier colour and a more rapid development of leaf and branch. Indeed every leaf and spikelet is a natural conductor, rearing its tiny lance into the atmosphere, and collecting, like the thunder-rod, the fluid that surrounds it, and this evidently to fulfil some necessary but as yet unknown purpose in its economy. Until the summer of 1844, however, we are not aware of any practical application of this principle—of any construction of apparatus by which either the free electricity of the air might be rendered more directly available, or an abundant supply generated by human means. At that time Dr Forster of Findrassie, near Elgin, bethought himself of the application, and after a few weeks' trial with the simplest apparatus, obtained evidence of its most extraordinary effects. Mr Crose of Taunton had long since proved that the free electricity of the air might be easily collected by wire suspended on poles at many feet from the earth's surface; and Dr Forster, availing himself of this knowledge, erected poles, and laid down the necessary wires in a portion of his lawn which had been sown with Chevalier barley. The plants on the plot thus treated soon became darker in colour, grew faster and more luxuriantly, and when cut down, yielded at the rate of $13\frac{1}{4}$ quarters of grain per acre, while the surrounding land—similarly treated in other respects—produced at the rate of only about $5\frac{1}{4}$ quarters! The ears of the electrified barley were not only more numerous and longer, and the grains larger and harder, but the dressed corn weighed nearly two pounds heavier per bushel than any other grown in the neighbourhood.

Such was the result of Dr Forster's experiment. The following is a detail of the plan by which the electric fluid was collected and applied to influence the crop:—

N. o S.

An oblong plot was measured off, running due south and north, at the corners of which wooden pegs were driven into the ground with staples for the attachment of the iron wire. The wire was then carried round the plot and buried to the depth of three inches, care being taken to lay the length due north and south by compass, and the breadth due east and west. The lines of buried wire being thus completed, poles were erected at N. and at S. for the support of the suspended wire. These poles were fourteen or fifteen feet in height, the wire being stretched from their tops and carried down on each side, so as to be in contact with the buried line. Thus the whole apparatus was completed, and the suspended wire left to collect the electricity of the atmosphere, and to convey it to the enclosed plot beneath. The cost at which the application can be made is computed at L.1 per acre, and it is reckoned to last ten or fifteen years, the wires being taken up and replaced each year.

This is certainly one of the cheapest modes in which electricity could be procured; but as the amount of free fluid in the atmosphere varies considerably, the supply might not in all cases be so powerful or so equable as to produce the desired effect. This, however, can be easily remedied in gardens and small plots by producing an artificial supply, either by plates of zinc and copper, by charcoal and zinc, or by some other of the numerous modes of eliciting an electric current. Indeed these latter methods have already been tried, though on a small scale; for we learn from the newspapers that

charcoal and zinc, Leyden jars, Smee's battery, and copper and zinc, have been successfully employed to generate the electricity, and the result has been equally favourable as that recorded by Dr Forster. Thus one individual grew two boxes of mustard-seed, to one of which he applied electricity, leaving the other to its usual course; the result was, the former grew three inches and a half while the latter grew only one inch. Another person applied the charges of a Leyden jar to an open cucumber bed, and succeeded in producing cucumbers five inches in length in thirty-seven days from the time of planting the seed. Again, it is stated in the proceedings of the New York Farmers' Club, that in July 1844 a Mr Ross exhibited potatoes measuring seven inches in diameter, and growing in the following way:—He planted the seed potatoes on the 6th of May, using only leaves for manure. Across three rows, at one end he buried a sheet of copper, 5 feet long and 14 inches wide, and at the other end, 200 feet distant, a sheet of zinc of like dimensions. The sheets were placed in an upright position, and were connected by a copper wire, thus making a galvanic battery—the moisture of the earth completing the circuit. On the 2d of July other tubers were dug, which measured $2\frac{1}{4}$ inches in diameter. Some of the adjoining rows beyond the battery were also tried, but few of them had potatoes larger than marrow-fat peas, certainly none larger than a boy's marble.

All this appears very satisfactory, and if confirmed by further trial, will undoubtedly create quite a revolution in agriculture. The force is inexhaustible, can be easily and cheaply applied, and what renders it different from other appliances, is confined to no particular region. Admitting it to be as successful as we could wish, it will not supersede the necessity of tillage, draining, and manure; but it will render these much more effective, will produce a heavier crop, and what is of first importance, considerably shorten the period of production. It would be unwise and premature as yet to say more on the matter; further experiments are necessary, and we are happy to learn that these, during the present season, will neither be few nor on a limited scale.

MR METHOD.

A REMINISCENCE OF VILLAGE CHARACTER.

MR METHOD had spent ten years as a general merchant in a country town, when some reverses occurring in a season of depressed trade so alarmed his prudential notions, that he resolved to retire with a small competency. Having taken this step, his irresolution prevented him, on a return of better times, from again employing his energies in business; so he retired to a country village, and there took up his abode for life, not altogether without some regrets and disappointments at his interrupted prospects of farther success in life, yet with a mind on the whole tranquil.

Mr Method was not a philosopher, nor a great politician, nor a man of fancy, nor of passion—but he had a way of his own and a will, which was law to himself and to his small household. He was one of those persons who lived by rule; he portioned out the day and the week into regular allotments, and one day and one week were to him the same during one year as during another. To say that Mr Method rose at a particular hour each morning would be a very loose statement: he got up at a particular minute; he had a razor for every day in the week, each numbered according to its day of office; and as soon would Mr Method have gone unshorn as he would have shaved with No. 3 on Monday, or used any other than No. 7 on Saturday.

Mr Method had his meals served up at particular stated times, exact to a minute. He liked a good, plain,

well cooked dinner exceedingly; but he would have put up with the roast decidedly underdone, so as that it came on the table exactly at the nick of time. He delighted in having a few friends around his board; but unless they were well aware of his habits, and came in proper time, they were as well away, for any unpunctuality cast a shade over the whole entertainment: indeed, with his most trustworthy guests he was invariably seized with a nervous feverishness for at least an hour before dinner was to be served up, apprehensive lest all should not go well. His nephew well nigh totally lost his affections by twice coming in ten minutes after time. When himself asked to others' entertainments, he was more to be relied on than the dinner bell, and was generally the first guest to make his appearance. At home he had certain dishes of meat for every day of the week, varied only by the different articles of which they were composed coming in at the several seasons of the year; so that his old friends, when they were asked to dine with him on a particular day, knew to a certainty what fare they were to get. Mr Method was a great walker: indeed this was one of his chief occupations. He walked on an average ten miles a-day. Every day had its particular allotment—one day north, another south, this day east, to-morrow west. His way to church lying due north, he started on Monday in a direction north-east, choosing this because he liked to follow the sun, and by Saturday he had got pretty well round to north once more. On each road he had many houses of call, where he paid visits to his friends. A rare plant, a newspaper, ripe fruit, or other trifle often formed the purport of his visit. Everybody knew when to expect Mr Method; and if, in the country, as sometimes happened, the timepiece stopped, or was allowed to run out, his appearance was as good as a knowledge of the exact time at Greenwich. Mr Method was a cheerful being, and you would have supposed that the whole country around was his own, and everybody he met his near relative—he had something to say to every one, words of vivacity and kindness, though of little import. He seemed to delight in the open air, though I never heard him express any admiration of natural scenery: a dry day and a wet one were much the same to him, only that for the latter he took most elaborate precautions in all the particulars of his equipment. He appeared to look upon a luxuriant summer landscape and a frost-bound wintry scene with equal indifference. When walking with him along a lonely road, in a sultry summer day, about five miles from his house, he asked me if I would like a cool radish. On my assenting, he suddenly stepped aside, and from the corner of a cornfield pulled up half-a-dozen beautiful radishes. 'I sowed a handful of seeds here,' said he, 'two months ago, not doubting but that I should stand in need and reap the harvest some day.' A friend related to me that, on one occasion, passing with Mr Method across a wide furze heath, he was much in want of a piece of iron to help in striking a light. On becoming acquainted with his desire, Mr Method stepped forwards about a hundred yards, and coming to a furze bush of a peculiar round form, he poked about its centre with his stick, and at last brought out an old horse-shoe. 'It is now almost five years,' said he, 'since I found this shoe, and deposited it in this place of safety, and now you see it has come to be of use, and I make you very welcome to it, though I disapprove of your cigar-smoking as an unnecessary practice.'

Mr Method was not a great student, nor a devourer

of books even of the lightest description. He had certain periods for reading, however. A good many years ago, when country posts were much less regular than they are at present, he got his daily London newspapers sometimes three or four at once. His first business was to unfold and arrange his papers according to their date; he then took the oldest, and made it form the subject of one day's reading, and next day he did the same with its successor. He thus, as he said, enjoyed all the excitement of a daily paper, and even when a very interesting debate was left unfinished in one sheet, he never allowed his curiosity to infringe upon the province of the next day's reading, although in the evening he has often expressed a longing for the arrival of the morrow that he might ascertain the result. When reading a novel, he never exceeded two chapters in a day, however intense the interest of the story; in this way he kept alive his curiosity, and prolonged his enjoyment for weeks or months.

Mr Method was of middle, or rather below the middle size, well made, and inclining to be fat. He had a full, rosy, round face, white teeth, sharp nose, a little snubbed, and soft, blue, mild-looking eyes. He was extremely neat in his dress, his linen always clean and of snowy whiteness; a small brilliant sparkled in his breast; he wore a short green coat, yellow vest, and drab trousers; in summer a white hat and in winter a black one; a walking stick, or an umbrella which folded up into a stick, was indispensable. In wet weather he was equipped in clothes curiously and artfully contrived to exclude wet, and at the same time to be light and conducive to his usual active habits of walking. On these occasions he wore India-rubber shoes of his own invention. He wore also and continually consulted a chronometer, which had been tested at Greenwich Observatory, and kept time to within a second in the year.

Mrs Method (for he was not a bachelor) was a wife worthy of such a husband. Not that she was gifted by nature with the innate habits of her spouse, but she had that better gift, and which is so beautiful a thing in woman, of a wish to accommodate herself to her destiny, and to follow the inclinations of her lord. Mrs Method had not the bump of order or regularity, and she had a very deficient memory; but she had great good nature and a love for her husband. One great business of his life had been to train her to his wishes; for this purpose he had constructed boards where his various hours of rising, dressing, eating, and walking were marked in large and legible characters. These were hung up in every part of the house—in the dining-room, the kitchen, and in two or three conspicuous parts of their bed-room. So numerous and precise were the directions, that they became a daily and perpetual study for Mrs Method; and she was to be seen at all times with her spectacles on, and one or other of the direction-boards in her hand, either reading it off for her own special use, or for the guidance of the cook, the housemaid, or the gardener. She had no children, but nevertheless her life was no sinecure, as every hour, from sunrise to sunset, had its peculiar appointments. I know not if Mrs Method had an equal enjoyment of existence as her husband; perhaps she was doomed to too much study to be perfectly happy. Yet, on the whole, they were a comfortable couple, and got through married life with not more than a fair share of snarlings, pets, and reconciliations. The last time I visited them, I found Mr Method busy with some modifications of a patent night-cap, which he expected to have an immense effect in mollifying a tendency to rheumatism in the jaw of his beloved spouse. This shows that, with all her shortcomings in punctuality, her husband never ceased to regard her with duly kind feelings. Since then, they have both passed from the stage, and taken up a position in the village churchyard, where a neat monument,

exactly suitable to Mr Method's taste, and which was indeed selected at a marble-cutter's by himself, informs the passer-by of the names and ages of those who sleep below.

PERSECUTIONS IN MASSACHUSETTS.

THE first settlers of the New England states, as is pretty well known, were men who fled from civil and religious persecution in England in the early part of the seventeenth century. As they had felt in their own persons and fortunes the sorrows of oppression for conscience' sake, it might naturally be expected that they would have had some sympathy for others in like circumstances. In this respect, however, the Pilgrim Fathers, as they have been termed, were no better than the men before whom they had fled. A volume might be written of their doings in the way of intolerance; but the following short chapter may suffice.

In the year 1656, when the colonists of Massachusetts were complacently congratulating themselves on having established a vigorous system of uniformity in religious matters, and expressing great thankfulness for having escaped from the troubles which had lately agitated England, they were very much surprised to learn that two women of the sect which had begun to be called Quakers were arrived in Boston from Barbadoes. There was no law in the colony against such persons; but that was considered unimportant; it was easy to make a little law for the occasion, or easier still to act without any law at all. This last alternative was adopted. The two unfortunate women, against whose character there was no reproach, were seized and put in prison; a few books found in their trunks were burnt by the hangman; and after suffering various indignities, they were turned out of the country. Persecution requires only a little spark to kindle it into a great flame. It would almost seem as if the misusage of the two women caused a flocking of Quakers from all the points of the compass to Boston, only for the sake of getting ill treated. In a short time eight made their appearance, and they in a like manner were imprisoned and banished. Thinking it now time to get a little law to regulate proceedings, a local court passed an enactment, declaring that any Quakers who should hereafter arrive in the colony should be severely whipped, and confined at hard labour in the house of correction. Immediately afterwards several came, were whipped, confined, and dismissed; and others took their place. It was evident the law was too lenient, so a fresh enactment was passed. Fines were imposed on every person who gave house-room to Quakers, or who attended their meetings, or otherwise sanctioned their pernicious opinions. Every Quaker, after the first conviction, if a man, was to lose one ear, and the second time the other; if a woman, she was each time to be severely whipped; and for the third offence, both men and women were to have their tongues bored through with a red-hot iron.

Quakers now arrived in the colony in great numbers. Glorifying in their sufferings the more they were persecuted, the more they came to testify their sincerity in their belief. Whippings, confinement, hard labour, fines, cutting off the ears, and boring the tongue being thus found ineffectual, a new law was passed in 1658, declaring that in future all Quakers who intruded themselves into Massachusetts should be banished on pain of death. Three Quakers forthwith offered themselves as the first victims; they had returned from banishment. Their names were Mary Dyer, Marmaduke Stephenson, and William Robinson. From their defence at their trial, nothing is more plain than that they were persons in a state of frenzy: their general argument was, that by means of visions they had been induced to come to Massachusetts and brave the worst that could be done to them. On the 19th of October 1659, they were condemned to die as malefactors; and three days later they were led out to execution. Mary Dyer saw her two brethren die before her eyes; and

she was on the point of meeting the same dreadful doom, the rope being already round her neck, 'when a faint shout was heard in the distance, which grew stronger and stronger, and was soon caught and repeated by a hundred willing hearts. "A reprieve, a reprieve!" was the cry, and the execution was stopped; but she, whose mind was intently fastened on another world, cried out, that she desired to suffer with her brethren, unless the magistrates would repeal their wicked law.

'She was saved by the intercession of her son, but on the express condition that she should be carried to the place of execution, and stand upon the gallows with a rope about her neck, and then be carried out of the colony. She was accordingly taken home to Rhode Island; but her resolution was still unshaken, and she was again moved to return to the "bloody town of Boston," where she arrived in the spring of 1660. This determination of a feeble and aged woman, to brave all the terrors of their laws, might well fill the magistrates with astonishment; but the pride of consistency had already involved them in acts of extreme cruelty, and they thought it impossible now to recede. The other executions were considered acts of stern necessity, and caused much discontent; a hope was entertained till the last moment, that the condemned would consent to depart from the jurisdiction; and when Mary Dyer was sent for by the court, after her second return, Governor Endicott said, "Are you the same Mary Dyer that was here before?" giving her an opportunity to escape by a denial of the fact, there having been another of the name returned from England. But she would make no evasion. "I am the same Mary Dyer that was here the last general court." "You will own yourself a Quaker, will you not?" "I own myself to be reproachfully called so;" and she was sentenced to be hanged on the morning of the next day. "This is no more than thou saidst before," was her intrepid reply, when the sentence of death was pronounced. "But now," said the governor, "it is to be executed; therefore prepare yourself, for to-morrow at nine o'clock you die!" "I came," was the reply, "in obedience to the will of God, the last general court, desiring you to repeal your unrighteous law of banishment on pain of death; and the same is my work now, and earnest request, although I told you if you refused to repeal them, the Lord would send others of his servants to witness against them."

'At the appointed time on the next day she was brought forth, and with a band of soldiers led through the town, about a mile to the place of execution, the drums beating before and behind her the whole way. When she was upon the gallows, it was told her that if she would return home she might come down and save her life; to which she replied, "Nay, I cannot, for in obedience to the will of the Lord I came, and in his will I abide faithful unto the death." Another said that she had been there before; she had the sentence of banishment upon pain of death, and had broken the law in coming again now, and therefore she was guilty of her own blood. "Nay," she answered, "I came to keep blood-guiltiness from you, desiring you to repeal the unrighteous and unjust law of banishment upon pain of death, made against the innocent servants of the Lord; therefore my blood will be required at your hands, who wilfully do it; but for those who do it in the simplicity of their hearts, I desire the Lord to forgive them; I came to do the will of my Father, and in obedience to his will I stand even to death." A minister who was present then said, "Mary Dyer, repent, oh repent, and be not so deluded and carried away by the deceit of the devil!" But she answered, "Nay, man, I am not now to repent." She was then asked to have the elders pray for her; but she said, "I know never an elder here." She added that she desired the prayers of all the people of God. "Perhaps," said one scoffingly, "she thinks there is none here." Then looking round she said, "I know but few here." Being again asked to have one of the elders pray for her, she said, "Nay, first a child, then a young man, then a

strong man, before an elder, in Christ Jesus." She spoke of the other world and of the eternal happiness into which she was about to enter; and "in this well-disposed condition was turned off, and died a martyr of Christ, being twice led to death, which the first time she expected with undaunted courage, and now suffered with Christian fortitude." "She hangs as a flag for others to take example by," said a member of the court, as the lifeless body hung suspended from the gallows.

Instead of being a warning, her death was only an encouragement. Another Quaker, named William Leddra, soon made his appearance, and after a tedious imprisonment, during which he was chained to a log of wood, he was brought to trial on the usual charge of returning from banishment. There was a dash of the ludicrous in the proceedings. One of the charges against him was that he refused to take off his hat in court, and another was that he persevered in saying 'thee' and 'thou.' 'Will you put me to death,' he asked, 'for speaking good English, and for not putting off my clothes?' 'A man may speak treason in good English,' was the reply. 'Is it treason to say "thee" and "thou" to a single person?' No good rejoinder could here be made by the judges, and while they were trying to stop his mouth by a few more questions, to their exceeding dismay another Quaker, named Winlock Christison, who had also returned from banishment, entered the court and placed himself beside the prisoner. The case of Leddra was first despatched, by condemning him to be executed, and this atrocity was committed on the 14th of March. Christison, at a second appearance before the court, received a like sentence, but leaving him the choice of voluntary banishment, and this latter alternative he appears to have embraced. The next culprits of the same class were Judah Browne and Peter Pierson, who, for no offence that we can perceive but that of being Quakers, were condemned to be tied to a cart's tail and whipped through several towns in the colony. Immediately after, as appears from the records of the court, a day of thanksgiving was appointed to be kept in acknowledgment of the many mercies enjoyed for years past 'in this remote wilderness.'

According to Mr Chandler,* from whose interesting work we have derived these melancholy details, the persecutions in Massachusetts gave offence to Charles II., who had other reasons to be dissatisfied with the colonists. He therefore enjoined all the governors of New England to proceed no farther with corporal punishment against Quakers, but to send them to England, with their respective crimes specifically set forth, in order that they might be disposed of according to law. 'The Quakers in London immediately chartered a vessel, and the mandamus being committed to Samuel Shattock, who had been banished from Massachusetts on pain of death, he arrived in the harbour of Boston in six weeks. The king's messenger and the commander of the ship landed on the day after their arrival, and proceeded directly to the governor's house. Admitted to his presence, he ordered Shattock's hat to be removed, but after perusing the letters, restored it and took off his own. After consultation with the deputy-governor, he informed the messenger that they should obey the king's command. In the evening the passengers of the ship came on shore, and, with their friends in the town, held a meeting, "where they returned praises to God for his mercy, manifested in their wonderful deliverance."

The colonial laws against Quakers were now abolished, and there were no more executions of this unhappy class of persons; but the magistracy were hostile to the sect, and for years afterwards they contrived to whip and otherwise maltreat any Quakers who fell into their hands; it would indeed seem doubtful whether the tortures and indignities they occasionally inflicted, particularly on the persons of females, were not worse than

death. The authority to which we have referred observes with justice that the Quakers who exposed themselves to these severities were not by any means blameless. Unlike the orderly Society of Friends in the present day, they appear to have taken a delight in annoying the constituted authorities, and disturbing the public peace. Much of this, however, was produced by their sufferings in the first instance; and the more violent amongst them, from a variety of causes, were evidently wrought up to a state of religious insanity. Allowing that they were as troublesome as their worst enemies can possibly represent them, there can now be but one sentiment respecting their treatment—unqualified condemnation of their oppressors. It is true there were laws equally severe against Quakers in Virginia and elsewhere; but this does not lessen the crime of the magistracy of Massachusetts. Descendants of Pilgrim Fathers who fled to the wilderness from persecution, if not themselves refugees, they ought to have sympathised in the eccentricities or convictions of others when placed in similar circumstances. How true is the remark of our author, that 'Religious intolerance was the mistake of the age!'

CURIOSITIES OF LITERATURE.

NO. I.

VARRO reckoned that, among the old philosophers, there were 800 opinions concerning the *summum bonum*. Modern philosophers do not appear to have lost the faculty of invention, for M. Reynière, in his *Cours Gastronomique*, affirms that they were acquainted in France with 685 different modes of dressing eggs for table, to say nothing of those which *nos savans* were discovering every day.

The earliest book in which engravings are found is a Dante, printed at Florence in 1481. Monday, the 5th of January 1665, is the date of the first number of the first review, the *Journal des Savans*, and the first book reviewed was an edition of Victor Vitensens and Vigellius Tapsensale, African bishops of the fifth century, by Father Chiffet, a Jesuit. The review was of small size, and published weekly, each number containing from twelve to sixteen pages.

Lope de Vega, the Spanish dramatist, wrote upwards of 2000 original pieces, but not more than 300 of them have been printed. He has himself stated that his average amount of work was five sheets a-day; and it has been calculated that he composed during his life 133,225 sheets, and about 21,300,000 verses.

The earliest instance of the use of linen paper is an Arabic version of the Aphorisms of Hippocrates, the manuscript of which bears date in the year 1100.

Pietro Bembo, a noble Venetian, secretary to Leo X., was noted for the fastidious revisals he bestowed upon his compositions. He had forty portfolios, through which each sheet gradually found its way; but no remove was ever made until it had undergone a fresh perusal, and further correction. Mr T. B. Macaulay states in one of his admirable essays, that he has in his possession the variations in a very fine stanza of Ariosto, which the poet had altered a hundred times. Petrarch is said to have made forty-four alterations in one verse. Gibbon wrote his memoir six times over, and after all has left it a fragment. In that work he has mentioned what a number of experiments he made in the composition of his great history, before he could hit the middle tone between a dull chronicle and a rhetorical declamation. The first chapter was written and re-written three times, and the second and third twice, before he was tolerably satisfied with their effect. Buffon wrote his *Epoques de la Nature* eighteen times before he allowed them to appear in print. Every line of Sismondi's Italian Republics was written three times, and so were almost the whole of his historical works. As he drew nearer the end of his life, composition was less laborious, and he contented himself with writing parts of the History of France twice over only. His revision of what he had written was very careful: he corrected his proofs five or six times, and generally twice read aloud all that he penned.

A shoemaker of the free city of Nuremberg, by name Hans Sachs, composed fifty-three sacred, and seventy-eight profane dramas, sixty-four farces, fifty-nine fables, and a great quantity of other poetry. He was born in 1464.

* American Criminal Trials, by F. W. Chandler. 2 vols. 1840.

The following whimsical will in rhyme was written by William Hunnis, a gentleman of the chapel under Edward VI., and afterwards chapel-master to Queen Elizabeth:—

'To God my souls I do bequeath, because it is his own,
My body to be laid in grave, where to my friends best known;
Executors I will none make, thereby great stryfe may grow,
Because the goods that I shall leave wyl not pay all I owe.'

The same person wrote a song commencing, 'When first mine eyes did view and mark,' printed in Campbell's Specimens, which Mr Hallam mentions with high praise.

Talk of the extensive sale which a popular work now-a-days meets with; why, in the year 1511, 1800 copies of the *Encomium Moris* (the Praise of Folly), by Erasmus, were disposed of, and in 1527, 24,000 copies of the same writer's Colloquies were printed and sold! Of the *De Imitatione Christi*, by old Thomas à Kempis, it has been calculated that 1800 editions have appeared; and sixty editions of the *Orlando Furioso* were published in the sixteenth century.

In 1568 there appeared a translation of Polybius, the patron of which is thus addressed in the dedication:—'Charles Watson wyseth thee Argantos' age, Polycrates' prosperity, Augustus' amitie, and after the consummation of this terrestrial tragedy, a seate amongst the celestial hierarchie.' Mr Watson seems to have been one of those men of compliments, whose 'high-born words' Shakspeare has ridiculed in *Love's Labour Lost*. Sir Walter Scott has also given us a specimen of Euphuism, as this inflated phraseology was called, in one of his novels.

Dr Philemon Holland, a translator of Plutarch's *Morals*, having made one pen do service throughout the work, which covered more than a ream of paper, indited this distich at the close of his labours:—

'This booke I wrote with one poor pen, made of a gray-goose quill;
A pen I found it, used before, a pen I leave it still.'

A cousin of Jeremy Bentham's had a notion, that whatever appeared in print was a lie. This was better, perhaps, than believing every published statement to be true. The philosopher, however, intent upon rooting this crotchet out of his relation's head, proceeded logically to work, and pressed him to say whether, in his opinion, if a fact had taken place, the putting it in print would cause it not to have taken place.

One of the *bon mots* which contributed to make Talleyrand so famous as a wit, was his definition of speech as a faculty given to man for the purpose of concealing his thoughts. The prince-bishop can well afford to give up the credit of having first made this sarcastic observation to an English clergyman. Young mentions some place,

'Where nature's end of language is declined,
And men talk only to conceal their mind.'

For the sake of contrast, we may as well add Horne Tooke's proposition:—'The purpose of language is to communicate our thoughts.'

In Pratt's edition of Bishop Hall's works, there is a glossary, comprehending upwards of 1100 articles, of obsolete or unusual words employed by him.

What a pretty tale was slaughtered when Mr Grenville Piggot pointed out, in his *Manual of Scandinavian Mythology*, the blundering translation of the passage, in an old Scandinavian poem, relating to the occupation of the blest in the halls of Valhalla, the northern Paradise. 'Soon shall we drink out of the curved horns of the head,' are the words found in the death-song of Regner Lodbrog; meaning by this violent figure to say, that they would imbibe their liquor out of cups formed from the crooked horns of animals. The first translators, however, not seeing their way clearly, rendered the passage, 'Soon shall we drink out of the skulls of our enemies;' and to this strange banquetting there are allusions without end to be met with in our literature. Peter Pindar, for example, once said that the booksellers, like the heroes of Valhalla, drank their wine out of the skulls of authors.

Hooker, the friend of Jewell and Crammer, all of them

'Unspotted names, and memorable long,
If there be force in virtue.'

made, like Socrates, an unfortunate choice of a wife. Sir Edwin Sandys, who had been his pupil, going one day to visit Hooker at his parsonage in Buckinghamshire, found him tending a flock of sheep by the order of his wife. He had a Horace in his hand, and was probably endeavouring to console himself with that pleasant picture of a country life which the poet has drawn.

In a German literary history of great merit, there is gravely enumerated, amongst the works which throw light upon the traditionary history of King Arthur, a 'Prospectus and Specimen of an intended National Work, by Robert and William Whistlecraft, proposed to comprise the most interesting particulars relating to King Arthur and his Round Table.' This of course was a burlesque.

The story of St Ursula and her eleven thousand virgins is well known. She was a Cornish princess, and set sail with her maiden train for Armorica, the modern Brittany; but by an odd conspiracy of the elements, their fleet was driven up the Rhine as far as Cologne. A tribe of savage Huns massacred the fair multitude, and their bones are shown to this day—a ghastly sight—in that city, where there is a church dedicated to their memory. It has been conjectured, and with great show of reason, that the writer who first transcribed the account mistook the name of the saint's attendant, Undecimilla, for the number *undecim millia* (11,000).

The *Orlando Innamorato*, a poem which preceded the more celebrated *Orlando Furioso* of Ariosto, was written by Count Boiardo of Scandiano, and was first published about 1495. The style is uncouth, abounding with rude Lombardisms; and consequently Berni, about half a century later, undertook the singular task of writing Boiardo's poem over again. He preserved the sense of almost every stanza, though every one was more or less altered, and he inserted a few introductory passages to each canto. The genius of Berni—playful, satirical, and flexible—was admirably fitted to perform this labour; the harsh dialect of the Lower Po was replaced by the racy idiom of Tuscany; and the Orlando Innamorato has descended to posterity as the work of two minds remarkably combined in this instance. The sole praise of invention, circumstance, description, and very frequently that of poetical figure and sentiment, belonging to Boiardo; that of style, in the limited use of the word, to Berni. Sir Walter Scott, at one period of his life, made it a practice to read through the two great poems, of which the Paladin Orlando is the hero, once every year.

The power of acquiring languages which some men possess is very extraordinary. There was an eastern monarch, named Mithridates, of whom the tradition is, that in an immense polyglot army, composed of a great variety of nations, he could talk to every soldier in his own language. The Chancellor d'Aguesseau of France made himself master of the Latin, Greek, Hebrew, Italian, Spanish, Portuguese, and English languages. So easily did he add a new language to his list, that he always spoke of its acquisition as an amusement. Niebuhr, the learned historian of Rome, and son of the celebrated traveller, was one of the greatest of modern linguists. He had actually mastered nineteen languages in addition to his own. In this showy accomplishment the Russians excel other nations. If you meet a Russ at a table d'hôte abroad, you are sure to find that he converses fluently with the miscellaneous persons about him in their own tongues. And this is the case for obvious reasons. The Slavonic languages have no literature of their own; the Russian, therefore, in order to receive any passable education at all, is made acquainted early in life with other European tongues.

THE PROBABLE APPLICATIONS OF THE ELECTRIC TELEGRAPH.

We may anticipate some most singular effects will be produced by the electric current. There is no reason why any great event might not be communicated at the same instant throughout the whole kingdom. The salutes fired on the occasion of her majesty's visit to the House of Lords might be instantaneously repeated at every station on all the railways in England; for the electric flame fires gunpowder, and the explosion of the powder is at the same instant with the crack of the discharge. The expense of Captain Warner's long range is at once spared to the country; instead of blowing up a ship at the moderate distance of six miles by one of his projectiles, we shall be enabled to do so at the distance of a thousand miles. There is, indeed, no reason why one of the lords of the Admiralty should not himself fire the guns of the batteries at Portsmouth, whilst calmly and quietly seated at the board in Whitehall. Nor is there any reason why the electric current may not be made to answer in the more peaceful or even the more elegant accomplishments of life. A galvanic arrangement might be made by which our

accomplished pianists, Madame Dulcken, might, with all the taste and skill which delights her London auditory, perform at the same moment for the gratification and enjoyment of Gosport and Southampton, and wherever a few wires could be conveniently transmitted. We might also observe that the Society for the Prevention of Cruelty to Animals ought to call upon every butcher to kill the animals used for food by electric galvanism. Each of these persons should have a small galvanic battery for this purpose. Not only is all pain spared to the poor lamb 'whom thy riot dooms to bleed to-day,' but the meat is rendered more tender and more delicate. It is more than half a century since Franklin commenced those experiments which the remorseless hand of war put a stop to, and which have been the precursors of the wonders of the present day. He proposed to give a feast to electricians, when 'a turkey is to be killed for our dinner by the electric shock,' 'roasted by the electric jack, before a fire kindled by the electrified bottle; when the healths of all the famous electricians of England, Holland, France, and Germany, are to be drunk in electrified bumpers, under the discharge of guns from the electric battery.' Were we to indulge in our prognostics of what will yet be done by the powers of electro-galvanism, we should be considered as visionary enthusiasts, and the laugh of the uninitiated would doubtless be loud and long; but already are some of the wonders made known, and nothing but the expense attendant upon them prevents them from being generally brought forward. By its means ships may yet be navigated on the ocean, our cities illuminated, the weather changed, life protracted, some diseases avoided; and we may use the language of him who first by electricity drew lightning from the clouds, 'I shall never have done if I tell you all my conjectures, thoughts, and imaginations, on the nature and operations of this electric fluid.'—*Polytechnic Review for May.*

A CARGO OF WIGS.

Sometimes French ambassadors carry their powers of protection to strange lengths, and apply them to singular purposes. It is related that one La Rose, first valet-de-chambre to M. d'Argental, in 1690, was persuaded by some one in Paris to lay out his savings in wigs, as a good speculation to take to Turkey. Finding, upon reaching Constantinople, that his stock remained on hand, and that he had been duped, he fell into low spirits, and had nigh died of despondency. The ambassador, seeing this, bethought himself of applying to the grand vizir, to see if he could not devise some plan for getting rid of the cargo. 'Nothing can be more easy,' replied the sultan's *alter ego*; 'leave the affair to me.' On the following day, a firman was issued, and read in the Jewish synagogues, commanding all Jews to wear wigs. Terrible was the confusion and running to and fro among the unfortunate Israelites of Balat and Khaas Kouy. Few knew the meaning of wigs: none knew where to find them. This having quickly reached La Rose's ears, he joyously delivered his store to a broker, who disposed of the whole in a few hours, and the speculator reaped a rich harvest. He was, however, directed by his master not to renew the venture. This was not the only strange proceeding on the part of M. d'Argental: indeed he carried his vagaries so far, that he was eventually put under restraint by his own secretaries.—*Three Years in Constantinople, by C. White.*

PUGNACITY OF THE ROBIN.

A correspondent of the Magazine of Natural History relates the following extraordinary instance of the pugnacity of the robin (*Erythraea Rubecula*):—Hearing one warbling in a tree adjoining my house, I was induced to place on the window-sill a beautifully stuffed specimen of the bird, in the hope that it would attract the attention of his living brother. Nor was I disappointed. The song became louder, and in longer strains; and at last he made a flight of inspection as far as the window. Shortly after he flew up from his tree, and made so violent an attack on the stuffed specimen, as to throw it from a height of two storeys to the ground, pursuing it even while falling, and continuing its violence when down. I then perched it on an empty box in the yard—the live bird remaining within a few feet of me all the time; and, directly I had retired a few paces, the attack was renewed with double vigour, and so obstinately, that I could easily have caught the living combatant. On my withdrawing the stuffed bird from the unequal contest, its opponent resumed his place on the

box, strutting about with an expanded tail and erect attitude, as if claiming and pronouncing a victory. Noticing the bird to be still hovering about the place, I replaced my stuffed specimen on the window-sill, securing the stand by a bradawl; and hardly had I done so before the robin resumed the war by settling on the head of his unconscious foe, digging and pecking at it with such ferocity and violence, that had I not interfered, the utter destruction of my poor specimen must have ensued. The experiment of course was not renewed; but the robin during the rest of the day kept watch in the immediate neighbourhood, and continued chanting his notes of defiance even in the shade of the evening.

LIGHT FOR ALL.

You cannot pay with money
The million sons of toil—
The sailor on the ocean,
The peasant on the soil,
The labourer in the quarry,
The hewer of the coal;
Your money pays the hand,
But it cannot pay the soul.

You raze on the cathedral,
Where turrets meet the sky;
Remember the foundations
That in earth and darkness lie:
For, were not those foundations
So darkly resting there,
Yon towers could never soar up
So proudly in the air.

The workshop must be crowded
That the palace may be bright;
If the ploughman did not plough,
Then the poet could not write.
Then let every toll be hallowed
That man performs for man,
And have its share of honour
As part of one great plan.

See, light darts down from heaven,
And enters where it may;
The eyes of all earth's people
Are cheered with one bright day.
And let the mind's true sunshine
Be spread o'er earth as free,
And fill the souls of men,
As the waters fill the sea.

The man who turns the soil
Need not have an earthy mind;
The digger 'mid the coal
Need not be in spirit blind:
The mind can shed a light
On each worthy labour done,
As lowliest things are bright
In the radiance of the sun.

The tailor, ay, the cobbler,
May lift their heads as men—
Better far than Alexander,
Could he wake to life again,
And think of all his bloodshed,
(And all for nothing too!)
And ask himself—'What made I
As useful as a shoe?'

What cheers the musing student,
The poet, the divine?
The thought that for his followers
A brighter day will shine.
Let every human labourer
Enjoy the vision bright—
Let the thought that comes from heaven
Be spread like heaven's own light!

Ye men who hold the pen,
Rise like a band inspired,
And, poets, let your lyrics
With hope for man be fired;
Till the earth becomes a temple,
And every human heart
Shall join in one great service,
Each happy in his part.

J. GOSTICK.

* * Complete sets of the Journal, First Series, in twelve volumes, and also odd numbers to complete sets, may be had from the publishers or their agents. A Stamped Edition issued for transmission, post free, price Two-pence halfpenny.

Printed by William Blandford, of No. 6, York Place, and Frederick Melhuish Evans, of No. 7, Church Row, both of St. John's Newington, in the county of Middlesex, printers, at their office, Lombard Street, in the parish of Whitechapel, and also of Lewis and Pugh, of St. John's Newington, (with permission of the Proprietors, W. and E. CHAMBERS), by WILLIAM SOMERVILLE GILL, Publisher, of St. Anne's Church, at No. 2, ABERN CORNER, both in the parish of Christchurch, and in the city of London.—Saturday, June 14, 1846.

PENGUINS.

ON some of the shores touched at by Captain Cook in the Pacific, the sailors found long rows of the sea-birds called penguins, which, having never before seen a human being, had acquired no respect for our race, but sat still with the greatest coolness, while the men approached with sticks to knock them on the head. Doubtless, penguins of any experience are now found to have their veneration in a sufficiently active state, as far as the human figure is concerned; but the recollection of what their conduct was when they occupied uninhabited shores, leads me to apply their name to a class of men who exhibit an equal degree of indifference towards their presumable superiors. They are a strange set the penguins—very worthy, clever, sensible people perhaps—attend to their duty, owe nothing which they cannot pay, take their share in putting to rights the evils of the world—much to praise about them, nothing to say against them—only this, they have no respect to give to anybody.

A proper penguin, let it be carefully remarked, is not a person who has a sullenness at his fellows, and withholds deference because he thinks it not justly due. He is no morose malcontent, who thinks to revenge real or ideal wrongs by abjuring the forms of politeness. There is not necessarily any ill-nature in his composition. The penguin is merely a person who, average in all other respects, is strikingly deficient in veneration. All grades, natural and artificial, are alike to him. While a man of high rank, or of any other kind of distinction, finds most of his fellow-creatures treating him with deference, and addressing him with bated breath and whispering humbleness, he is met by the penguin at the second, or perhaps even the first interview, upon the footing of an old acquaintance, as if there were nothing at all particular about him. The suave delicacy and reserve with which even equals of gentlemanly condition address each other on a first acquaintance in this country, is unknown to the penguin. He is quite at his ease at the first, and never advances into intimacy with any one, simply because he is as intimate at starting as he could be at the end of twenty years.

We have, in Mr Lockhart's *Life of Sir Walter Scott*, a curious example of the character, where a poet, comparatively in humble circumstances, and unknown to fame, is allowed by the author of *Marmion* to visit him. At the first, he is, with this child of nature, 'Mr Scott,' then 'Scott' only, then 'Walter.' Mrs Scott is at the same time 'Charlotte'; and the visitor stretches himself upon the pureness of her dimity sofa with the greatest unconcern. Nothing could have been more penguin-like in all respects; for in the first place, this kind of person is as remarkable for his want of all veneration for one's upholstery, as he is for non-deference to one's self. He

is fearless in his advances to reserved easy-chairs, and makes his way amongst drawing-room bijouterie-tables with the air of a rustic passing through a harvest field. Introduce him to the most elegant lady, and probably he will sit down close against her, with the back of the chair presented in front, and his arms leaning across the back. Then he is equally free and easy in his appellatives. *Misters* and *mis'esses* have no charms for him. The regular Christian name is the best which any of his friends can expect from him to their faces: while speaking of them, this is invariably familiarised, so that one would suppose, only hearing his conversation, that he knew nobody but persons in the humblest walks of life. There is no affectation in this; for, were he an expectant of patronage, brought for the first time into the presence of an East India director, it is ten to one he would be calling the deity of Leadenhall Street by his plain surname only, before the end of the interview. The truth appears to be, that he sees in a great man only the common human image; and this being exactly what he possesses himself, he feels no occasion for regarding it as an object to be held in any reverence. He may thus be what is called an ill-bred man; but yet, the character being perfectly natural and unaffected, he rarely is felt to be a positively offensive one. On the contrary, one cannot sometimes help being amused, if not interested, by conduct which is marked by so much simplicity, and in which we can read, that if we are little venerated, so are we as little feared.

An excellent opportunity for studying the various degrees of penguinism and ante-penguinism of mankind, is afforded by the forming of new acquaintances through letters of introduction. I presume myself to be speaking of a person who possesses some kind of worldly consequence, whether from his own qualities, or the accident of his birth and fortune. Let him watch the demeanour of individuals who come to see him, bearing letters of introduction in their hands, or who at most send them in immediately before by a servant. Some will appear to him decidedly too venerative—almost timidly so: too little manliness and self-respect: the hat will hang awkwardly in the hand, the vertebral column decline too much from the vertical. There will be a solicitude of eye and face almost painful to the beholder; and chairs will be treated with far more deference than any mortal chairs deserve. Others again will be self-possessed and easy, without either bashfulness or forwardness. But see, at length comes the penguin! A strutting or shuffling *degagé* walk ushers in a specimen of humanity, the very reverse of that above described—who, after a hasty good morning, gives you the letter, and then goes to whistle or hum at a window till you have read it. When you advance to greet him as the person whom you have ascertained him to be, he greets you. He wishes you to be quite at your ease in your

own house, and not make any fuss on his account. He likes your prospect, hopes your wife is well, and expresses his approval of the weather, in a breath. Smith, whom you have inquired for—the common friend who has sent the letter—is an excellent fellow, or a good creature, as the whim may strike him; the fact being, that our stranger is a protégé or dependent of that gentleman, and has no notion of being anything else for some time to come. He has not read your last work yet (supposing you an author), but he hears it well spoken of, and intends to read it. He thought you rather unfortunate in the choice of subject for the one which preceded it. Then he tells you how he once gave you a favourable notice in some provincial newspaper, the very name of which you never heard of. And he has no doubt that, with one thing and another, you make a tolerable income. You may feel at first a little disconcerted by the air of easy self-confidence of the man, and his want of all those phrases of deference to which you are accustomed; but you soon see that the man means no indignity. He treats you as he would treat the shade of Milton, were it sent upon the earth, or as he would treat the queen upon the throne to-morrow. He is merely a penguin. It may be remarked that penguinism, as a characteristic, is not confined to individuals. I know penguin families, whole tribes of people, who are remarkable for their fearless indifference to all real and conventional superiority. The English, as a nation, are more penguins than the Scotch, the Americans still more so than the English. Political institutions help in bringing about this effect; and perhaps social circumstances also operate. There cannot, for instance, be more penguinism in a large dense community than in a village. A country great man is apt, when he goes to London, to regard it as a city of penguins.

Great penguinism, though many will regard it as a pardonable oddity, will not, upon the whole, serve to advance a man's fortunes. Nothing does so, perhaps, which conveys the impression, as this does, of a deficiency in the tone of society. Were I asked to set down a practical rule of life upon this point, I would say, Be not either too much or too little of the penguin. Treat real and implied superiors with a manly ease, remote alike from familiarity and servility; leaving good sense and good feeling to guide you aright in particulars. There is, in reality, a pretty wide middle field within which you may range without much danger of giving offence; but be careful not to trespass too far beyond this neutral ground in either direction.

LONDON IN 1765, BY A FRENCHMAN.

In the year above indicated a French gentleman visited England for the purpose of observing the manners of our nation, at a time when, according to the popular prejudice, his countrymen were regarded as our natural enemies. The remarks which he afterwards published occupy three volumes. They are written in a lively style, and include almost everything worthy of note in London, to which city it seems the writer confined himself. The arts and sciences, theatres, public walks, manufactures, police, jurisprudence, manners and customs, servants, poor, national melancholy, and king, lords, and commons, are all noticed; as well as the scientific societies, and Wilkes and 45. It may not be unprofitable to compare the opinions and descriptions of this foreigner with the existing state of things. The writer tells us that the only words of English he knew were *very good* and *very well*. To this circumstance we must therefore attribute many obvious errors in his descriptions.

Our traveller, who does not give his name, begins by describing his voyage across the channel from Boulogne to Dover in one of the old sailing packets, through a very rough sea, which, he tells us, operated on most of the passengers with the 'effect of the most violent

emetic;' but that for his part being 'fortified by resignation to death, which ought to be the chief cargo of those who undertake voyages of curiosity,' he experienced none of the unpleasant effects which he witnessed in his fellow-passengers. Those were not the days of steam: who ever thinks of 'resignation' now—a-days in a run across the channel? On landing at Dover, where we shall leave him to speak for himself, we are informed that he took the 'two customhouse officers for beggars; they had the look of their profession, which is the lowest and vilest of any; they opened my trunk, and withdrew very humbly without having appeared to examine any of my things. It cost me afterwards a crown to release it from the customhouse. The only inhabitants at Dover are sailors, pilots, and innkeepers. There is nothing remarkable in the town but the enormous signs of the taverns. I saw several postchaises start, driven by little boys twelve or thirteen years old, who, I was told, were excellent postillions. I looked all over the town for a church, but could see nothing to lead me to suppose that such a thing was to be found. I could only obtain food at the inn by going to the kitchen, and helping myself to some of the beef-steaks that were broiling on the fire; this was the only cheer I could get.

'I left Dover for London in what they call the Flying Coach, drawn by six horses; the distance is eighty miles, and the journey consumes a whole day; for this the charge is one guinea, but your servant is carried at half price. The coachmen, who were changed with every change of horses, were jolly and good-looking, and dressed in good *phash*. The space not taken up by luggage was filled with kegs of brandy, which were distributed at the various taverns we passed on the route, so that, if we were often delayed, we had at least the pleasure of a little innocent smuggling to make up for it. The people that we saw had a sadness of physiognomy only seen in France on the faces of those who have buried their best friends.

'The roads, covered with broken flints, are well kept: there is a turnpike at every village, where you must pay according to the scale of charges; the king even is not exempted, but must pay in advance, or the gate would be shut in his face. There are footpaths for those who walk, which are well preserved: these are at the sides of the road, or, in places where it is narrow, in the field adjoining. There are several reasons for the great attention paid to foot passengers: first, life is held in particular esteem; many objects of pleasure and convenience are sacrificed to it; the laws are not exclusively made or administered by those who ride in coaches; and as people travel as fast in the country, as slow in the towns, they wish to avoid the risk of injuring the pedestrians. The farms appear everywhere in a flourishing condition: the labourers who drive the powerful teams wear convenient boots, and their garments are made of good cloth. The public authorities are content to encourage and animate rural industry, which they would fear to destroy if they attempted to direct.

'I reached London towards the close of the day: although the sun had not set, Westminster Bridge, the great road leading to it, as well as the diverging streets, were all lighted up. The sight of the bridge, the river, the streets crowded with vehicles, the throng of passengers on the wide pavements, told to the advantage of the finest quarter of London. We drove through them, and at last, quite by chance, I found myself settled in an apartment in the house of the *Cuisinier Royal*, in Leicester Fields: this neighbourhood is filled with small houses which are mostly let to foreigners.

'The next morning I went out alone, after a careful study of the map of London, and entering Oxford Street, walked down Holborn and the Strand to St Paul's, and then on to the Exchange and the Tower: I returned by crossing London Bridge, through Southwark and Lambeth to Westminster, a district full of mean houses and meaner taverns. The first view of London is favour-

able, and this it owes entirely to the Thames, which flows by it from south to north, turning at the bend where Whitehall stands from west to east. Whitehall seems to indicate by its position the palace of a sovereign. I have said that the Thames flows by London, for opposite Westminster is nothing but the open country, though the few houses which are built on that side are increasing in number. Lower down on the same side is Southwark, which the common people call *Soudrick*, an ill-built suburb, tenanted almost entirely by tanners and dyers, and connected with the city by London Bridge, which stands a specimen of the architectural boldness and skill of the days in which it was built. A little above Whitehall is Westminster Bridge, built in the last reign: it is an erection superior to any other of the kind in Europe.

'Below the old bridge the Thames forms the port of London, immense in its extent, safe, deep enough for all vessels, and unequalled in the prodigious concourse of ships which are continually arriving and departing: it is a port of which the citizens are justly proud, and justifies the reply of the alderman to James I., who threatened to remove the seat of royalty—"At least your majesty will leave us the Thames."

'The grandeur which London derives from the river is due entirely to nature; art does nothing but to destroy or conceal it. There are no quays along the whole extent of the city; and it would appear that every imaginable means is used to hide the sight of this noble stream, in the same way that the Seine was formerly imprisoned at Paris. Here there is nothing but wharfs, docks, piers, and stairs, which, while they disfigure the banks, obstruct the channel and collect all the filth of the town. Even from the bridges it is impossible to get a view of the river, as the parapets are ten feet high; so that, during my first walk, in order to gratify my curiosity I was obliged to mount to the upper storey of a building which overlooked the stream. The reason given for all this is the inclination which the English, and the Londoners especially, have for suicide. It is true that above and below the town the banks are unprotected, and offer an excellent opportunity to those who really wish to drown themselves; but the distance is great, and besides those who desire to leave the world in this manner, prefer doing so before the eyes of the public. The parapets, however, of the new bridge, which is being built between the two at present standing, will be but of an ordinary height. It would seem that the architect means to act with regard to the good citizens in the same way as children are cured of greediness, by leaving confectionary and sweetmeats at their disposal; so it is hoped that in a little time the number of deaths by drowning will diminish, and then the banks of the river will probably be thrown open, and the city derive all the advantage from purification of the air.

'The new bridge is not yet christened; the friends of England's living Demosthenes wish to name it *Pitt Bridge*; while the opposite party contend for the appellation of *Blackfriars*, from a monastery of that order which once stood in the vicinity. Whatever name may be given to it, it surpasses that of Westminster in boldness of design, magnificence of structure, and decoration. It was to have been completed in five years, in each of which the parliament voted 300 guineas to the architect; unforeseen accidents have, however, prolonged the building, which is now in the tenth year from its commencement.

'In public and private buildings, London can show nothing equal, in point of grandeur, to those of Paris and the cities of Italy. The whole list is soon enumerated: there is Somerset House, built of the remains of old churches by the uncle and protector of the last of the Edwards, in bad taste, and now partially in ruins; *

the Lord Mayor's House, Temple Bar, St Paul's, the Exchange, the Monument, and some churches buried among houses. There is nothing remarkable about the Tower, except a battery of 100 cannon of large calibre, which defends it on the side towards the river: this edifice is said to have existed from the time of the conquest of the island by Julius Cæsar.

'Old London is divided in its entire length by two great streets parallel with the Thames—the Strand, which at one of its extremities takes the name of Cheapside; and Holborn, which is disagreeably intruded on by Newgate prison. These two thoroughfares are spacious, but have no direct line; St Paul's is the natural perspective object from the Strand, but in reality you only see the cathedral when close upon it. The inscription on the Monument tells us that after the fire the streets were built on new lines. This can scarcely be believed when we see houses flung down apparently at random; in fact, it would hardly be possible to build streets so narrow or so tortuous; they are paved also in such a manner that it is barely possible to ride or walk on them in safety, and they are always extremely dirty. The finest streets—the Strand, Cheapside, Holborn—would be impassable, were it not that on each side, for the convenience of the passengers, footways are made from four to five feet wide; and for communication from one to the other across the street, there are smaller footways elevated above the general surface of the roadway, and formed of large stones selected for the purpose. It is easy to imagine the inconvenience that these frequent crossings cause to the passage of wheel-carriages. In the finest part of the Strand, near St Clement's church, I noticed, during the whole of my stay in London, that the middle of the street was constantly covered with liquid stinking mud, three or four inches deep; with this, owing to the continual jolting and splashing, the walkers are bespattered from head to foot; it flies through the open windows of coaches, and covers the lower storey of the houses; every morning the apprentices may be seen washing away from their shop fronts the accumulated mud of the previous day.

'The natives, however, brave all these disagreeables, wrapped up in long blue coats like dressing-gowns, wearing brown stockings, and perukes rough, red, and frizzled. The paving consists of stones just as they are drawn from the quarry: they are nearly round, and have neither top, bottom, nor sides, and roll and rub one against the other in the foundation on which they are laid, which is nothing but an accumulation of old mud. All the art of the pavioir is comprised in placing these stones as near together as possible; and bad as it is, this paving is very dear. Granite is too expensive for general use, as it is brought from the extremity of the kingdom. The great streets, however, leading from the houses of parliament to Charing-Cross and Pall Mall, are partly paved with granite, which has begun to extend itself towards the Strand. The two former of these streets were dry enough to require frequent watering in May, while all the rest of the city was deluged with mud.*

'In order to avoid as much as possible the dirt of the principal thoroughfares, the foot-passengers make use of the courts which traverse the district between the Strand and Holborn. Through these crowds are continually passing; they contain the finest shops, which, with the attractions they furnish to the fair sex, the choice arrangement and brilliance of the display of stuffs or objects of taste, with the *filles de boutique*, are quite sufficient to induce persons to choose that route, independently of their greater cleanliness. The shops of the main streets are, however, the most striking spectacle

make way for the present structure, the principal portion of which was completed by the architect, Sir William Chambers, in 1779, and opened for the transaction of business in 1780. It occupies an area within a few feet as large as Russell Square.

* We are told in a note that, for the method of watering the streets, and for hackney-coaches and sedan-chairs, Paris was indebted to London.

* The building here alluded to was erected in the year 1547, a few years before the execution of the Duke of Somerset, its owner; it was given up for public use in 1776, and soon after pulled down to

which London offers to the eyes of a stranger; they are all enclosed in glass, ornamented on the outside with mouldings from the antique. Gay in the variety and arrangement of articles exposed for sale, they present an appearance to which Paris can offer nothing comparable.

'The new districts of London bear no resemblance to the old, except in their wide footways, which are every day increasing. The shops of the great thoroughfare, Oxford Street, will disappear as the houses are sought after for private dwellings by the rich: soon will the great city extend itself to *Marylebone*, which is not more than a quarter of a league distant. At present it is a village, principally of taverns, inhabited by French refugees. Up to the time of the last reign, the nobility lived on their estates, and when they visited London they occupied hired apartments; but now they have abandoned the system of their forefathers, and the mania for building in the town has seized them, which, if it continue, will double the city in extent in the course of the next century. The new streets are built uniformly of brick, of two or at the most three storeys, on the model of Bedford House, erected by Inigo Jones. There is an underground apartment, by which greater salubrity is given to the first floor, separated from the street by an area three or four feet wide, enclosed with an iron railing; underneath the pavement are cellars, which add materially to the convenience of the lower floors in the facilities they afford for cleanliness, and supplying coal to the house through an opening covered by a moveable stone. The iron railing, more or less ornamented, terminates in pilasters, forming a sort of advanced doorway, surmounted by the two little lamps which it is expected every house will furnish towards the lighting of the city during the night, thus uniting ornament with utility. The only inconvenience resulting from it, is that notwithstanding the respectful manners of the working-classes of England towards the public, it is difficult to prevent spilling the oil during the daily trimming of the lamps. I saw a person's head broken by the fall of one of them; he, however, took it in good part, and seemed well contented with the excuses of the lamplighter. These lamps, all enclosed in glass coverings, are lighted about half an hour before sunset; they illuminate the pavement, but in the middle of the wide streets there is scarcely light enough to guide the numerous vehicles. From a regard for the people, it happens that, to all the public buildings, churches, &c. a clock with a large dial is attached, so that the foot-passengers are saved the expense and inconvenience of carrying watches.

'In the new quarters of the town are situated those quadrangular openings, sometimes of great extent, here called *squares*. There is generally a fountain or a bowling green in the centre. Grosvenor Square is laid out as a garden with walks. Others have equestrian statues of some of the kings. Red Lion Square is ornamented with a truncated obelisk of great proportions, which has a very good effect. The houses round these squares are not uniform in appearance, but are decorated according to the taste of the proprietors.

'I have seen but four houses in London which will bear comparison with the great *hotels* of Paris, and these being built of brick, do not appear with the same splendour as those of the latter city. Montague House,* however, merits particular distinction, from its great extent, arrangement, the magnificence of its ornaments, and the agreeableness of its position; it is more like a royal palace than the house of a private individual. The government has purchased this building for the reception of monuments, statues, and all collections, the preservation of which may aid the cause of art or science for the present or the future. It is called the British

Museum, although it is not yet complete in all its departments.

'New London is as dirty as the older parts of the town, owing to the clayey nature of the ground on which it is built: there are drains which carry off some of the excess to the river, and it is strictly forbidden to throw dirty water from any of the windows; yet the finest streets were always wet and foul during the whole time of my stay. To the inconvenience of mud must be added that of smoke, which, mingled with a perpetual fog, covers London as a pall. This smoke is occasioned in the winter, which lasts eight months, by the fires of the numerous factories, and by the coal which is universally consumed. If the city increase in extent, the inhabitants must make up their minds never to see the sun: it is but rarely that it can break through the smoky clouds, and these occasions the Londoners call their *glorious days*. The prevailing taste for walking, however, leads them to brave all weather. On the 26th of April, I saw St James's Park, covered incessantly with fogs, smoke, and rain, crowded with promenaders; a sight that excited my admiration for the remainder of the day. The rain brings down the floating particles of smoke from the atmosphere in the form of showers of ink, soiling everything exposed to the weather, and with double effect, as it is not the fashion to use umbrellas. Among the shops are great numbers of clothes-cleaners: the washing is perpetual. The same blackness is produced on the buildings: St Paul's looks as though it were built of coal; and the sombre appearance is increased by the parts most exposed retaining something of their original colour—which is that of bright Portland stone. The interior of the houses even is not exempt from the destructive effects of the smoke; the furniture, pictures, hangings, and especially books, become very soon discoloured, and wrapped in the same lugubrious covering.

'The police of London is in the hands of a few magistrates, of no more importance than the district *commisaires* at Paris: crimes are punished, but no attempt seems to be made to prevent them; there are, however, no spies kept in the pay of the authorities, nor is any secret correspondence carried on. There are no troops, or guard, or watch of any kind, except during the night by some old men, chosen from the dregs of the people; their only arms are a stick and a lantern; they walk about the streets, crying the hour every time the clocks strike, and announce the state of the weather; they also wake those persons who wish to start on a journey at any particular hour, and it appears to be a point of etiquette among hair-brained youngsters, to maul them on leaving their parties.

'London, being thus without guard or watch, inhabited by people who wear no arms, with the exception of physicians, who are always dressed in black, and wear a sword, appears to be protected by the commandment *Non occides*, and by the laws against murder. It is the only great city in Europe in which no assassinations are committed. I proved this by every means in my power; I walked at all hours of the night in the alleys and courts, which are very dimly lighted, without incurring the least danger. I have been in the middle of highly excited mobs, who were surrounded with soldiers; but the fear of shedding blood created mutual respect in both parties. In short, the people of London, though proud and hasty, are good at heart, and humane even in the lowest class. If any stoppage occurs in the streets, they are always ready to lend their assistance to remove the difficulty, instead of raising a quarrel which might end in murder, as is often the case in Paris. At public festivals and ceremonies, however great the crowd, children and persons of diminutive stature are sure to meet with attention, to open them a passage, or lift them to some elevated position where they may be able to see. There are no guards with muskets, paltans, or halberts; the only weapon employed is a hollow stick, which, when it is used—a rare occurrence—makes a great noise without inflicting pain.'

* Those who feel interested in objects of antiquity, will regret to hear that this building, spoken of in such high terms, will shortly be entirely removed, when the new building, now in progress, is completed.

Here we must take leave of our Frenchman, who, it will be seen, describes a state of things very different from those existing in our own times. Such a retrospect is fair evidence of the gradual advance of society; the evils from which great masses of the population are suffering, are light in comparison with those of the former century. What would be thought in the present day of throwing 'dirty water,' not to speak of more offensive matters, into the streets? The moral view taken by the writer of our people is favourable when compared with those of his own country; but we fear that his remarks on the 'respectful manners' of the humbler classes would hardly be borne out by the facts in modern London. It is, however, gratifying to find that, on the whole, the condition of society has improved, and this not only for the sake of the present generation, but because we may hence presume that there will be further improvement in the future.

TRICKS IN THE TRAFFIC OF OBJECTS OF ART.

THE traveller who visits many of the countless churches strewed over the European continent, or the public and private picture galleries both there and in this country, cannot fail to be surprised at the number of *originals* which he meets with. There are very few collections which do not boast either of a 'real' Claude, Raffaele, Rembrandt, Rubens, Dolce, Caracci, or Corregio; and he is forced to conclude that, if all he hears be true, the painters of bygone times must have painted night and day during their long lives to have produced such a vast number of beautiful subjects. It is, however, well understood that by far the greater number of these pictures are spurious—either copies from the undoubted works of the masters to whom they are attributed, or successful imitations of their manner by inferior and modern artists. An account of some of the ingenious methods by which such paintings are first copied and then palmed off upon purchasers, may serve various useful ends.

It is not always that artists are aware, when employed to copy pictures, that they are in the remotest degree contributing to the carrying out of a successful fraud. To show how this sometimes happens, we need only relate an anecdote which we recently heard. Our informant, who is well known in London for his fidelity in copying, was one day busy in his studio, when a carriage rolled up to his door. A stranger of aristocratic mien entered, bringing with him a beautiful female head, evidently painted by a great master. He inquired if our friend would like to copy it at his own price, and if so, when it would be done? The answer was in the affirmative, and the required time named. The new patron said he would be punctual in returning for the original and the promised copy, and without more ado, took leave and drove off. The artist regarded him as some eccentric nobleman, and when leisure permitted, commenced his task, which he completed within the required time. Sure enough, on the day agreed on, the gentleman again appeared, and professed himself so much delighted with the exactitude of the copy that he paid the painter a few pounds more than he demanded.

A week or two after, the artist was surprised by another visit from the same person, who brought a second and equally beautiful head, to be copied upon exactly the same conditions as to time and price. Our friend's suspicions were now roused, for he began to suspect that his aristocratic-looking patron was a picture-dealer in disguise; but before he could express his doubts, the gentleman vanished. After some hesitation, he set to work and completed his task within the time specified, determining, however, not to part with the pictures without some explanation. When therefore

his employer again appeared, he demanded a pledge that the copies were not intended to be put to any improper use, or to be passed off as originals. The stranger was indignant, demurred to the artist's right of demanding any such pledge, and after some discussion, was allowed to take away both pictures, having first given the usual remuneration for the artist's labour.

Time passed on, and our friend had nearly forgotten the transaction, when a nobleman, from whom he had previously received many commissions, returned from abroad, and called on him to request his opinion of 'an exquisite Carlo Dolce,' which was to be sold in a collection advertised for sale in the mansion of a gentleman in the Regent's Park. 'It will,' he continued, 'form an admirable companion to a picture by the same artist I was fortunate enough to pick up in Italy for a bagatelle of three hundred guineas.' Upon this our friend posted off to the Regent's Park to examine the wonderful and undoubted Carlo Dolce. On beholding it, he was astonished to find his own work! Hastening to his noble patron's house to communicate what he had seen, he was shown into the library, when the first thing that met his eye was his other performance! His surprise was doubled; and he inquired on the entrance of his friend, 'is that the picture for which you gave three hundred guineas in Rome?' The answer was in the affirmative, and a detail was entered into of the circumstances of the purchase. It was bought in the palace of a decayed Italian family, 'where it had lain in a neglected apartment for more than a century.' Our painter took down the picture, turned it over, examined it minutely, saw that it had been lined with old canvas to give it an ancient look, and at last exclaimed that he had painted it himself. It was the second copy he had made for his mysterious employer!

Of course the sale of the other so-called Dolce in the Regent's Park was stopped, and the 'gentleman' who had advertised it was exposed to the world in his true character; that of a tricking picture-dealer.

It is not difficult to explain how our friend's copy got into the Italian palace, and how it was purposely placed in a neglected apartment to deceive the buyer. This kind of trick is common in Italy. It is the more easily practised, from the fact of many decayed gentlemen of that country turning picture-dealers and hanging subjects in their rooms, so as to make them pass for heirlooms or ancient family possessions; many paintings are actually imported into Italy for that purpose. This, however, is an old device, and most picture-fanciers are on their guard against it when invited to visit the gallery of an Italian gentleman, cautiously abstaining from hinting at a purchase, should a feeler to that effect be thrown out by the host. More artful contrivances are occasionally resorted to, some of which are exposed in a clever article in a recent number of the Foreign Quarterly Review. One of the most curious relates to M. K—, a Russian amateur, who was invited by some Florentine gentlemen to join a shooting excursion. Whilst they pursued their sport, he, disgusted by ill success, returned to wait for them at a cottage where their horses were put up. Having got into conversation with its occupant, the latter inquired if his guest was fond of pictures, as he had something curious that might interest him. After a long story how his father had on his deathbed confided to him the secret that a picture concealed in the house was of value sufficient to make the fortune of all his family, but that, having been feloniously obtained, it would, if ever shown or sold in that neighbourhood, certainly bring him into trouble—the rustic produced a very pleasing Madonna and Child, in an antique carved frame. The Russian cordially admired the picture, and being asked to guess the artist, named Raffaele. 'That,' said the peasant, 'was, I do believe, the very name my father mentioned; but you can see if it was so, as he gave me this bit of paper with the name written on it.' On the dirty shred there was in fact scrawled 'Raffaele Sanzi;' and its possessor went on to hint that, being anxious to realise what he knew to be

most valuable property, and seeing no great chance of then disposing of it safely, he would accept from him, as a foreigner, a price far below its value. The negotiation thus opened, ended in the Russian offering 35,000 francs, or £1400, which, after due hesitation, was accepted. The prize was huddled into a clothes-bag, and its new master, without waiting to take leave of his friends, started for Florence, and thence hurried on to Rome, lest it should be stopped by the Tuscan government.* There he boasted of his acquisition, and showed it to several connoisseurs, who sang its praises until Signor V——, a skilful dealer, quickly recognised the real artist. It was in fact a beautiful repetition, with slight variations, of Raffaello's famous 'Madonna del Gran-duca;' it was painted by Micheli, an Italian painter still alive, who avows that he sold it for 150 crowns; and the shooting-party was a conspiracy by several well-born swindlers to take in their Russian friend! The latter returned to Florence to seek redress by a prosecution, which was compromised by their returning most of the price. 'Being curious to see or obtain the subject of so strange a tale, we,' continues the writer in the Foreign Quarterly, 'subsequently inquired for the picture, but were told it might probably be met with as an original in some great German collection, having been there resold by the Russian at a price almost equal to what he had himself originally paid!' Thus this picture was the subject of a double fraud. Indeed there are many 'undoubted' originals, the history of which, if faithfully recorded, would lay bare a long chain of cheateries.

Of course the regular traders in pictures, being looked upon with a sort of suspicion, require to exercise a superior degree of ingenuity to effect their sales. We learn from the above source, that among the cleverest of the Roman dealers is Signor A——, a fair-spoken fellow and facetious withal, who, conscious of his own talent, is ever ready to adduce some instance of its happy exercise. A year or two since he made a wholesale transaction, which, in a short half hour, transferred to a young Irish peer the accumulated rubbish of his magazine. At the lucky moment of *milord's* visit, there arrived a liveried servant with an official-looking missive, which A—— apologised for opening, and after glancing at it, said, 'Very good, but I have no time now to look at your pictures; come again.' The servant hesitated, and to the inquiries of the stranger, A—— said it was only the particulars of a lot of pictures which had been sent to him for sale, the heritage of an old Bolognese family, but that he had never had leisure to open the boxes, which must stand over till he could attend to the matter. On his lordship pressing to have a sight of them, A—— reluctantly opened the cases, protesting that it was of no use, as it would take much time to clean, and arrange, and value this collection; before which, of course, the pictures were not for sale. The list exhibited Guidos, Domenichinos, Caraccis, Carlo Dolci; in short, just that class of names which impose upon an Anglican amateur; and the dingy canvases were freely acknowledged to be so completely obscured by dirt and old varnish, that their merits were undistinguishable. The more the dealer seemed anxious to divert his customer to the brightly varnished ornaments of his own walls, the less willing was he to lose sight of this singular chance of procuring 'a genuine gallery ready made,' and ere the parties separated, a transfer was made to the peer of a mass of trash which scarcely merited the outlay of cleaning, in exchange for a thousand louis-d'or.

A still bolder *coup de main* was successfully played off by the same worthy some years before, at the expense of an experienced purchaser and acknowledged connoisseur. He persuaded the late Mr C—— to look at a picture of high pretensions and of some merit in

his house. Whilst they were discussing it, the jingle of posting bells was heard in the street, and the prolonged crack of a courier's whip echoed in the doorway. A—— started, rushed out, and beheld an express, booted, spurred, and splashed, who handed him a letter. Tearing it open, he appeared struck with confusion, and exclaimed, 'Well, here is a fine scrape I have got into.'

'What is the matter?'

'Why, I am talking about selling you this picture, and here is the courier sent back from Ancona to buy it, by a Russian gentleman to whom I offered it last week, for such a sum.'

The price was a large one, and Mr C—— would not have thought of giving it for the picture, which did not interest him much; but so cleverly did A—— contrive to transfer to it the interest of this dramatic scene, that, in the excitement of the moment, a bargain was struck; and our countryman went off delighted at the idea of having 'done' the Russian; the latter being an imaginary personage, and his courier a Roman postboy, hired to gallop up in the nick of time!

It is not, however, only in pictures that this kind of fraud is carried on. In sculptures, models, cameos, and objects of virtue, the same system is extensively practised. It is well known that in the neighbourhood of the excavated cities of Herculaneum and Pompeii, regular manufactories of 'antiquities' exist for the supply of the curious who visit the neighbourhood of Mount Vesuvius. Coins, cameos, bas-reliefs, and intaglios are got up—it is true in some instances by very clever artists, and often in themselves extremely beautiful—and deposited amidst ruins, to be dug up in the presence of some gaping amateur, and sold for treble their value. An English nobleman, who was known to devote his wealth liberally to the acquisition of antiques, having some time ago arrived in Rome, set the curiosity-dealers at work to tempt him with 'antiques.' The most intelligent of them, one V——, commissioned a cameo, which he made sure would please the earl, from one of the best fabricators of antique gems. A fine stone having been selected, it was finished in the best style, and committed to a jeweller to be set as a ring. In his hands it was usually broken to bits: the plot was defeated, the dealer was furious, but the victim was not saved. The wily Italian fell upon a device to render the bait more than ever deadly. Having selected a principal morsel of the cameo, he carried it to the peer as a fragment just brought in by a peasant, which, though incomplete, rivalled the rarest gems in perfection of material and of art. After dwelling upon it with that mellifluous eloquence which only an Italian can employ to good purpose—for in a language whose every syllable is euphony even verbiage becomes effective—he obtained for it a sum which far more than repaid his outlay. Now, as some collectors of such relics so treasure those which time or violence has broken, as almost to give them a seeming preference, the lord and the dealer had perhaps equal reason to be satisfied with the transaction. But there were more fragments behind; so, after pocketing the price and bowing himself out, V—— returned to say, that as it would be a pity the rest of so lovely a work should be lost, he had desired the peasant to dig again for the other bits, in which he might very probably be successful. Next day he returned with another morsel, which he celebrated by another string of superlative epithets, and sold by another tissue of falsehoods for another ransom; and that in due time was succeeded by the remaining fragments—all separately produced, separately puffed, and separately paid for, until in the end the accidental fracture of the stone proved to have quadrupled its price.

The anecdote of the Carlo Dolce in the Regent's Park shows that discreditable tricks and contrivances for the sale of pictures are not confined to Italy. In England, and especially in London, this dishonesty is organised into a system. The stale devices of the auctioneer and

* In some of the Italian states the exportation of pictures is forbidden on pain of forfeiture and a heavy fine.

the saleroom have been long too well known, to deceive any but the merest tyro in picture-buying. Hence more elaborate deceptions are carried out, some of them requiring an amount of capital, time, and knowledge of art, which is in itself wonderful. Take as an example the person whom our friend exposed; he was no doubt in league with a set of Italian dealers of the same caste. He sends them copies to plant about in various residences, and they in return supply him with the deceptive produce of Italian easels, and with the refuse of sale-galleries.* He takes a large house in the Regent's Park, fits up a picture-gallery, and lives to all appearance in great style. He becomes a patron of art, employs some clever copyists, some openly, others as we have detailed, and buys a few good but cheap originals from the modern exhibitions. After a year or two thus spent, he establishes a character as a connoisseur. Presently he gives out that he is going abroad, and brings his gallery 'to the hammer.' Expensive catalogues *raisonnées* are printed, with the (spurious) history of each picture minutely set down. Picture-fanciers flock to the mansion, and—unless an exposure supervenes—on the day of sale the gallery not only realises enough to pay all expenses, but yields a handsome profit. Upon this profit a new scheme is set on foot; and by such unworthy traffic we are assured that large fortunes have been made.

Indeed many persons who are picture-dealers, and nothing else, manage to keep up appearances for years so well, that they are seldom suspected of being anything worse than rich connoisseurs who are fickle in their tastes, and fond of changing their pictures. Instances of the style in which these persons do business are related in the May number of the Art-Union. 'A picture-dealer, living in a very showy private residence, and keeping a carriage; livery servants, &c. bought a fine picture by Decker. It was signed by his name, and purchased for £40. A London artist, now deceased, "sharpened the foliage," and added two figures from a picture by J. Ruysdael, which was placed by his side during the alteration; the name of Decker was carefully obliterated, and that of Jacob Ruysdael inserted from the dealer's collection of imitative autographs—a store of which is possessed by all members of the trading race. The picture was soon afterwards sold for 480 guineas. The poor artist got 12 guineas for his assistance in the deception. About the same time, as Albert Cuyp was much in fashion, the same dealer obtained several copies of small works of Cuyp from France and Holland, which, after being lined and undergoing a very rapid advance into the appearance of age, were eagerly sought and purchased. They were "touched up" by a poor intemperate but clever artist, who was kept constantly at work in one of the attics, at miserable weekly wages. Their cost averaged £18 or £20; but they were sold at prices from £150 to £200 each.'

Mr Pye, in his 'Patronage of British Art,' reveals a trick by which fresh paintings are turned into 'antiques' by wholesale. 'There was in Westminster a manufactory where several persons were employed making copies, which, after having been soiled with dust and varnish, were thrown into an oven built on purpose and moderately warmed, where, in the course of an hour or two, they became cracked, and acquired the appearance of age. I will venture to assert that many of our superficial connoisseurs have been caught with this snare, and have preferred, to the best modern productions, those of what was facetiously termed "the Westminster Oven."'

Of the tricks of auctioneers and their satellites, the Art-Union makes a full exposure. Innumerable are the pleas of genuineness under which pictures are sold by

auction. One is a seizure by a sheriff; another a collection upon which a London banker has advanced a large amount, and to be peremptorily sold to cover such advance; another the remainder of the collection of an Italian nobleman. 'During the two days that pictures are commonly "on view" in the sale-room, they are attended by one of the gang who is not known to the public generally as a picture-dealer. He may be a hosier, a master-carpenter, a music-seller, a corn-doctor, or of any other trade; his business in the saleroom during the view days is to endeavour to enter into conversation with any gentleman who may drop in, and to tickle him up with praises and valuations of the various specimens. The individual has an interest in the spoil, and is sometimes, or generally, the furnisher of money in these speculations.'

'The day of sale arrives. The auctioneer, without the least blush of shame, assures the audience—composed principally of the owners of the pictures he is about to sell—that such an opportunity as he then offers rarely occurs; that every picture is genuine, and to be sold or sacrificed without reserve. The biddings are small and slow, if there is any show of well-dressed strangers present; great bargains appear to be knocked down—by the seller to the real owners—until some one of the well-dressed strangers is tempted to offer a bidding.

"Gentlemen," said the auctioneer, in one very recent case, "I most particularly call your attention to this lot, which cost my employer an immense sum. He always esteemed it the gem of his collection. A finer work of this great master cannot be seen, and in such a state of purity; often and often has he refused 500 guineas for this masterpiece, which I am now submitting entirely to your hands; you will have it at your own price—there is no reserve. Gentlemen, give me a bidding; shall I begin at 400 guineas? Who says 400 guineas?" No answer—a pause. "Well, I am astonished. Gentlemen, do look again! I shall be ashamed to give an account of this to my employer. I fully expected for such a treasure of art to obtain a great sum. Say 200 guineas—100 guineas—well, anything you please: I am in your hands, there is no reserve!" Upon this the real owner of the picture, who is a dealer, left his seat, took out his eye-glass, advanced to the easel upon which the picture was placed, and went down on one knee to scrutinize his own property. The auction-room—in which this scene took place—has a low ceiling, and but indifferent light. The owner played the part of "viewing" with wondrous dramatic effect; and in a voice pregnant with affected surprise and anxiety, bid 30 guineas. The auctioneer had his cue. "Well, I am astonished! 30 guineas for such a glorious gem; you must be joking with me gentlemen—you can't be serious." Forty guineas are now offered by a confederate, which is eagerly bid on by the owner at 45 guineas. This dalliance was carried on by the auctioneer, the owner, and the confederate interspersed with a deal of by-play and mysterious nod and whisplings, until a stranger present was seduced into an offer of 70 guineas, when the owner of the picture shut up his eye-glass, and coolly turned his back to the auctioneer—a telegraphic signal understood by the whole party that the victim was entrapped. At the picture was of course knocked down to a *bond fide* purchaser, the history of it may be instructive. It was bought by the dealer some time before at a sale of imported rubbish for 25s.; was lined, the dirt cleaned off one unsatisfactory figure obliterated, and the heads of other figures altered. A poor but cleverish artist did this for the pittance of 30s.; and the advantageous changes were made from prints. The picture was now "dirtied down," and after it had been unsuccessfully offered in sales got up at Birmingham, Manchester, and other provincial cities, it returned, after a year or two spent in wandering, to find a gulled proprietor in dingy saleroom.'

Nothing can better illustrate, than these anecdotes the irrational and artificial media through which pictures are sold.

* Of the extent to which the importation of pictures is carried on, an idea may be formed from the fact that, within the last five years, somewhere between 60,000 and 70,000 'ancient' pictures have been imported into England, paying the duty at the customhouse in London.

ures are prized and estimated. The name of the artist raises its value more than the real merit of the picture. This is not wholly unavoidable, it is true, in ordinary judgments on works of art; for it requires a high amount of intellectual taste to judge of the intrinsic beauties of a picture, while everybody can tell whether its painter enjoys a high reputation or not; and if he lo, the inference is not unnatural that his work must be good. This mode of judging is, it appears, carried to a greater height in England than where knowledge of art is more widely diffused. In Italy good copies are looked upon with more respect and admiration than in this country; whilst bad originals are condemned as they deserve. Here, on the contrary, be the real merits of a picture ever so moderate, any price is given for it if it only can be made to pass under a great name. While we are disposed, therefore, to censure dealers for the frauds they practise, let us not forget the vast temptations ignorant and prejudiced purchasers hold out to them by the enormous prices they offer for supposed 'originals.' Purchasers are in most instances parties to the frauds they themselves suffer by.

A recently deceased and witty divine had an excellent method of protecting himself against his own want of judgment and the frauds of dealers. One morning when we had the pleasure of breakfasting with him, we amused ourselves whilst he was temporarily occupied by looking at the pictures hung on his walls. 'Ah,' he remarked, 'you will not find anything very brilliant here! The fact is, I have closely adhered to one rule through life. When I take a fancy to a picture, I have never allowed myself to give more than fifty shillings or it.'

'Still you may have picked up some very valuable ones at that price?'

'I don't suppose I have,' answered our reverend friend gravely, 'for one day I had a visit from a great picture-dealer, and after he had examined my collection very attentively, I asked him what he thought of them? Slowly shaking his head, he replied, "And so, sir, you gave only fifty shillings a-piece for them. Well, sir, permit me to say that you do your judgment great wrong; or allow me to tell you, sir, that there are some paintings in your possession which are worth at least three pounds!"'

MILTON'S BLINDNESS.

WE do not think that any but a blind man could have written the *Paradise Lost*. We mean a blind man who had once enjoyed sight. Let us try to substantiate this remark, and to show what influence Milton's blindness exerted over his poetry. That it must have exerted some influence—that Milton's poetry must in some respect be different from what it would have been had he not been blind—cannot be doubted. The slightest peculiarity about an author tinges his writings; and it is only because it rarely happens that the entire character of a person's writings is decided by any one peculiarity, that we are not more accustomed to regard this influence. But blindness is no ordinary peculiarity. Even if a person who has been in the habit of writing goes to Arabia, and comes back again, all that he writes afterwards will, to a certainty, be affected by that visit to Arabia. How much more will not a change come over the spirit of a man's writings who, after walking for forty-seven years in the light and blaze of day, passes at once and for ever into an atmosphere of darkness! That Milton's blindness should not have affected his poetry, that there should not be a marked difference between the poems he wrote before he became blind and those he wrote after, is impossible. The only question is, whether this effect, this difference, can be ascertained. We think it can. It is no mere illusive, im palpable peculiarity, of which we are sensible, without possessing the power to lay hold of or describe it; it is easily detected. Nay, we are inclined to put the case so

strongly, as to say that Milton's blindness was a *requisite* to his writing *Paradise Lost*.

When we affirm that Milton's blindness exerted an influence over his poetry, we do not mean merely that it enabled him to withdraw his mind from external objects, and left him at liberty to pursue his daring theme. That was a decided influence, no doubt, but it is not the one on which we lay stress. Neither do we refer to the well-known passages in which Milton deprecates his loss of sight. The insertion of a few such passages, if that were all, would not amount to much. Nor, lastly, do we refer to the influence which Milton's blindness must have exerted over his verse, in respect of its having obliged him to compose at length mentally, and then dictate, although this is by no means an insignificant consideration. We propose to show that Milton's blindness affected his poetry in a way more specific and remarkable than any of these; that Milton's whole manner of conceiving and describing external objects is that of a blind man; and that this manner of conceiving and describing things was so peculiarly suitable for his great poem, that it might be made a question whether Milton's blindness did not actuate his choice of a subject.

The conception which will be most familiar to a blind man, will be that of infinitely extended blackness. The world outside will be to him like what it would be to a man with the use of his eyes standing alone on a mountain-top in a very dark night, and looking upward. Now, a blind man who has once enjoyed sight will carry with him into his own black atmosphere a memory full of images of what he has seen; and when he tries to describe things by their appearance, it will be by an effort of recollection. He will amuse himself by painting, on the dark canvas stretched before him, those objects which he has most pleasure in recollecting—the white gable of his own cottage, the faces of his wife and children. The power of love will keep the recollection of such objects as these bright and vivid, while all other images are growing dimmer and dimmer. But there is a certain class of images, the recollection of which in a state of blindness would always continue to be easy and pleasurable. It would be difficult for a person who had been blind for some time to recall the appearance of such a flower as the violet; whereas he would retain to the last a remarkably vivid conception of white or luminous objects—a lamp, the mouth of a furnace, a streak of light, the sun, the moon, a ball of glowing iron, the ground covered with snow, the winter sky studded with stars. In fact, a man who had grown blind would excel a person still retaining the use of sight in all that kind of description which consists in the contrast of white and black, of light and darkness. Now, this power of dealing with light and darkness, as it were, in masses, is exactly that which would be a qualification for writing such a poem as the *Paradise Lost*. Three-fourths of the description in that poem are precisely of the kind in which a blind man would be pre-eminently apt and powerful. The beings whose actions form the subject of the poem are angels, described as moving to and fro in the universe, surveying creation from some remote point beyond its limits, or decrying a silver star in the distance far away, and winging their flight towards it. This sort of description must be easier to a man to whom space and blackness are the same thing, than it could possibly be to a man to whom space is colourless, or, at the most, a sort of faint blue transparency. The most important descriptions in the *Paradise Lost* consist, at bottom, of contrasts of blackness with light, light in the form of masses, or particles, or streaks, or discs.

To proceed to instances. It would be quite possible to prefix to the *Paradise Lost* a plate or diagram of the universe as Milton conceived it mapped out. At first, according to the poet, the whole infinity of space was divided into two huge regions or hemispheres, an upper and a lower, the one all light, the other all darkness. The upper or illuminated half was heaven, the abode of the angels, then the only creatures existing. The

under half was chaos or night, a thick, black, turbulent element, as of universes in a state of pulp. No beings resided in it. But after the fall of the angels, space was laid out anew, and instead of only two regions, there came to be four. The bottom of chaos was converted into hell; and at the top, where chaos pressed against heaven, a huge cavity was scooped out of the blackness, into which the light rushed down. This cavity was man's universe. The principle of gravitation being imparted to it, all the matter within the swoop of this right-royal principle left the pulpy form in which it had hitherto existed, and coagulated into balls or planets. Then the Divine impulse came, and the balls spun round each other, the planets round their suns, and the moons round their planets. So that, bounded above by heaven, and beneath by the chaos out of which it had been cut, there existed now a new azure universe powdered with stars and streaked with galaxies. It was destined to be the residence of a new race of creatures. Hell, the residence of the fallen portion of the old race, was separated from it by chaos.

This is the fundamental conception of the *Paradise Lost*. The infinity of space thus divided, first into two, and afterwards into four regions, is the scene in which the action of the poem is laid. Now, such a gigantic conception could not have occurred to any except a blind man; or if it had occurred to any one else, he could not have sustained it consistently throughout the poem. But how consistently has Milton sustained it! Thus, when he describes the rout of the rebel angels driven before the Messiah's thunder, the crystal wall of heaven

'Rolled inward, and a spacious gap disclosed
Into the wasteful deep; the monstrous sight
Struck them with terror backward; but far worse
Urged them behind; headlong themselves they threw
Down from the verge of heaven: eternal wrath
Burnt after them to the bottomless pit.'

It was Milton's blindness that gave him this grand figure. Reading the passage, one sees chaos, as it were, an infinite mass of solid blackness, and the descent of the angels through it like a red hissing fiery funnel. So in many other passages; that, for instance, describing the creation of man's universe; or the following one, describing Satan's glance into chaos, when, standing at the mouth of hell, he prepares to launch into it in quest of the new universe—

'Before their eyes in sudden view appear
The secrets of the hoary deep, a dark
Illimitable ocean, without bound,
Without dimension, where length, breadth, and height,
And time, and place, are lost, where endless night
And chaos, ancestors of nature, hold
Eternal anarchy, amidst the noise
Of endless wars, and by confusion stand.'

If this passage had not the tone of a narrative, it might pass for a Lamentation on Blindness. Making his way through chaos, Satan at last emerges into the light of the new universe. Directing his flight first to the sun—

'There lands the fiend; a spot like which, perhaps,
Astronomer in the sun's lucent orb,
Through his glazed optic tube, yet never saw.'

This splendid image of Satan alighting on the sun being like a spot dimming its disc, we can hardly conceive presenting itself to the mind of any but a blind man; but how readily to his!

The following is the poet's description of the creation of light—

'"Let there be light," God said; and forthwith light
Ethereal, first of things, quintessence pure
Sprung from the deep; and from her native east,
To journey through the ætry gloom began,
Sphered in a radiant cloud.'

In this passage the influence of the poet's blindness appears in two ways. In the first place, as in the former passages, the conception is that of a blind man. All at

first is profound darkness, a black atmosphere; but forthwith there arises a vapour-like something in the east, which slowly creeps westward through the gloom, like a mist from the sea. This is light. In the second place, there is a sort of sentimental lingering in the description, unlike what would be natural in the case of a poet not afflicted with that calamity, which made light so dear to Milton, and all the circumstances of its appearance so delightful to his memory.

Besides the passages we have selected, fifty or sixty others might be given. The only sort of description which five-sixths of the poem required, or would tolerate, is precisely that in which the power Milton's blindness gave him of contrasting light and darkness on the great scale, and of conceiving luminous objects, enabled him to excel. No doubt, if a man having the use of his eyesight had dared to attempt the subject of the *Paradise Lost*, he would, as a matter of necessity, have been obliged to deal with blackness and fire, chaoes and galaxies, just as Milton has done. No doubt, also, there are poets, not blind, whose imagination is at home in the vast and gigantic, who figure to themselves the earth as a brown little ball wheeling through space, and whistling as it wheels. Thus Shakespeare speaks of 'striking flat the thick rotundity o' the world.' Still, none except a blind man could have been so consistent throughout in that sort of description as Milton. But not only does he, more than any other poet, contrast fire and blackness on the great scale; he employs the same contrast as a means of representing what it would never have occurred to any but a blind man to represent in that way. Thus, when Satan, seized in *Paradise* by Ithuriel and Zephon, is brought before Gabriel and his band of angels, he dares them to battle—

'While thus he spake, th' angelic squadron bright
Turned fiery red, sharpened in mooned horns
Their phalanx, and began to hem him round.'

Who but a blind man could have fancied the appearance of the band of angels hemming Satan in like that of a crescent moon? But luminousness with Milton served as a means of describing everything. Satan starting up when touched by Ithuriel's spear, as he was sitting in the shape of a toad at Eve's ear, is compared to the explosion of a powder magazine. Brilliancy is Milton's synonyme for beauty. The eyes of the serpent are glowing carbuncles, his neck is verdant burnished gold. The locks of the unfallen angels are inwreathed with beams of light; and their golden harps hang by their sides glittering like quivers.

But deduct those five-sixths of the *Paradise Lost* in which the descriptions are all grand and gigantic—of spirits warring in heaven, toiling through chaos, or winging from star to star—there remains still one-sixth of the poem in which, leaving the regions of space, the poet condescends on our dear particular planet, and outpours his imagination in rich and luscious descriptions of earth's own scenes and landscapes, the fragrant woods, the blooming gardens, the daisied banks, and green overarching bowers of Eden's *Paradise*. How are these passages of rich vegetable description to be accounted for? Suns and moons and chaoes were easy; but whence got he the trees, and shrubs, and flowers?—that blind old man!

If we examine Milton's earlier poems—those which he wrote before he became blind—we shall find their characteristic to be luscious and flowery description. In this respect we know none so like him as the poet Keats. Take, for instance, the following exquisite passage from *Lycidas*—

'Return, Sicilian muse,
And call the vales, and bid them hither cast
Their bells and flowerets of a thousand hues.
Ye valleys low, where the mild whispers use
Of shades and wanton winds, and gushing brooks,
On whose fresh lap the swart star sparsely looks—
Throw hither all your quaint enamelled eyes,
That on the green turf suck the honeyed showers,
And purple all the ground with vernal flowers;
Bring the rath primrose, that forsaken dies,

The tufted crow-toe, and pale jessamine,
The white pink, and the pansy freaked with jet,
The glowing violet,
The musk rose, and the well-attired woodbine,
With cowslip wan, that hang the pensive head,
And every flower that sad embroidery wears;
Bid amaranthus all his beauty shed,
And daffodillies fill their cups with tears,
To strew the laurel hearse where Lycid lies.*

There is not a passage like this in all the *Paradise Lost*. If the poet, after being blind for some time, had attempted to rival it, he could have accomplished the feat only by the help of a book on botany. Here is the passage describing Eve's nuptial bower in *Paradise*, and we may be sure that on this occasion Milton would lavish his richest beauties—

* The roof
Of thickest covert was, inwoven shade,
Laurel and myrtle, and what higher grew
Of firm and fragrant leaf; on either side
Acanthus, and each odorous bushy shrub
Fenced up the verdant wall: each beauteous flower,
Iris all hues, roses, and jessamine,
Reared high their flourished heads between, and wrought
Mosaic; under foot the violet,
Crocus, and hyacinth, with rich inlay,
Brodered the ground, more coloured than with stone
Of costliest emblem.*

Beautiful still; brave recollections of his old loves, the flowers. But, alas, alas! the recollections are growing fainter and fewer in the mind of the blind old man. Yet, as the images of his youth are growing dimmer and dimmer, he is fast nearing that life where he shall renew them all again, and where, amid the spheres of which he sung, and thrilling to a higher music than that which his soul loved so dearly on earth, his eyes shall no more shut out the light nor the colours of the little flowers.

Milton's earlier poems, we have said, remind us of Keats. No poet is so 'lush' in description, to use his own word, as poor Keats. He knew the secrets of the flowers, as if he had been the very bee that buzzed among them, and sipped their sweets. Now, had Keats suddenly grown blind, would he not have forgotten the flowers, and would not his fine soul, then pent up and unwindowed, have employed itself building castles of sunbeams in the darkness within?

JONATHAN SHARP.

A GENTLEMAN who takes to himself the above characteristic name has recently issued to the British public a three-volume work, which professes to give an account of his personal adventures.* He is a Kentuckian, and declares in his preface a determination to be very severe on the faults of his compatriots. As the reader, however, advances into the book, he is surprised to find little that can be unpalatable to Americans. Mr Sharp began his career in Louisville, where his parents kept an inn; but the successful opposition of a rival publican, and a fire, reduced the family to poverty and the inn to ashes; but, says the author, 'my father was a man of prompt resolution. His energies did not fail him in the present emergency. He packed a scanty wardrobe in a small portmanteau, took me with him on board a steamboat going down to New Orleans, and thus got rid at once of all his difficulties.' The worthy couple at length landed at New Orleans, and the son obtained a situation as under-clerk at a cotton broker's, with a salary of 2000 dollars a-year. This employment did not suit the views of the enterprising young gentleman, and, being fond of travel, he exchanged it for a clerkship on board a steamboat. The following anecdote proves how they manage steamboats on the Mississippi. 'One day a new boat

entered into competition with the Beaver. It was a light craft, recently built, and beat us by fifteen hours in the trip. This so much exasperated our captain, that he determined to race with her on her return to New Orleans. Being better acquainted with the shallows and the bars in the Red river, our skill gave us a marked superiority; but, as soon as we entered the broader and deeper waters of the Mississippi, we lost our advantage. In vain we put on more steam; our opponent shot ahead of us in no time. We now became frantic with jealousy and disappointment, and made up our mind to board and sink her, even at the price of our own lives. Unfortunately, ill-luck threw a snag* in our way. We struck, filled in ten minutes, and the Beaver sank like a bar of lead. One passenger and myself alone escaped from drowning: so sudden had been the accident, that of course nothing was saved.' After this the wrecked clerk 'having,' he adds, 'no luggage to look after, started on foot for New Orleans, which happily was only three hundred miles distant.'

The passion for travel which Mr Jonathan Sharp possessed was so strong, that he determined to see a little Spanish life in Cuba, and set sail for that island. On board ship he met with a young Irishman named O'Neil, who became the companion of his future adventures. Arrived at Havannah, he declares himself to have been transported with admiration at its beauty; and tells the following pretty story connected with its foundation. 'A short time after the discovery of the island, the Spaniards were desirous of erecting a fortified city, that might command the Gulf of Mexico. They searched a great while along the coast, till at last they entered, through a narrow rocky channel, into a deep broad bay. The engineers declared immediately that such a place, well fortified, would defy any hostile forces, and the adventurers landed on the very spot where now stands the celebrated "Moro." There was on the other side of the bay a large Indian village, built upon a beautiful green lawn, and on that spot it was determined that the new settlement should be formed. Presents were offered to the Indians, to induce them to retire to some other quarter: but no; they stoutly refused to do so. There were they born; there their fathers' bones were laid; and there they wished to live and die. The Europeans withdrew, resolving in their own minds to carry the place by force, as soon as they had collected a sufficient number of their troops; and in the meantime they erected a little village called Reglas, now employed as a quarantine ground. It was fortified as well as circumstances would allow, and Sanchez de Rebeira, a young officer of prepossessing appearance, was left in it with sixty soldiers, and a few families of Andalusian farmers. The Indians on their side distrusting the strangers, and suspecting that they would return in great force to execute their purpose, lost no time in surrounding their town with walls and palisades; yet they showed no signs of hostility, but, on the contrary, kept up a constant intercourse with Reglas, exchanging their produce, and even the precious metals—no doubt obtained from the Main—for the manufactured goods of Europe. During this friendly intercourse between the two people, Sanchez had frequent opportunities of seeing and admiring a beautiful young girl, the daughter of one of the principal chiefs. He loved her ardently, and told her of his love.' For this 'the poor girl had

* Jonathan Sharp, or the Adventures of a Kentuckian: written by himself. Henry Colburn: London.

* A tree carried down stream by the current, and fired in the bottom in such a way as to present one end against passing vessels, which are often pierced in this manner.

to suffer all the anger and contempt of her family; and when the Spaniards attacked the town, she was compelled to perform the most menial offices of a slave. Yet was she still very beautiful, and Sanchez, who was gifted with a generous nature, resolved that, at any risk, he would free her from so wretched a fate. He found means to penetrate into the village, and pressed her once more within his arms. She had endured too much at the hands of her kindred: human nature could bear no more: her former love to them was changed into bitter hatred. She thirsted now for revenge: she told her plans to the Spaniard. A week afterwards the troops were surrounding the walls. It was a dark windy night; the soldiers were under arms. All at once yells and cries were heard, and a column of flames burst forth in the middle of the town. It was the signal. Provided with ladders, the Spaniards stormed the palisades, and the Indians, having to struggle against fire and sword, were soon overpowered; and their wish was fulfilled; they died where they were born and where they had lived.

During the massacre, Sanchez, fearing for the safety of his love, searched for her, calling her by her name. At last he arrived at a small platform, and there beheld her. But alas! reason had forsaken her seat. The dread spirit of revenge had mastered all her faculties. There she stood, her hair flowing in the wind, the foam upon her lips—a terrible picture of passion—hideous, frantic—a bloody sword in one hand, a flaming torch in the other, and madly exulting over the ashes of her home and the corpses of her kindred. She sang some wild imprecations, and while her lover vainly endeavoured to call her to him by the most endearing expressions, she burst a blood-vessel, and died—the first that had betrayed her people. The few women who had not fallen during the slaughter mourned over her. They said that she had been “Havana”—a mad woman—one whose brain had been burned by the avenging finger of the Great Spirit.

Faithful to his love, Sanchez raised a statue to her on the spot where she had died, representing her such as I have written above. It is to be seen even now in one of the shady walks beyond the walls of the present city, although, being entirely concealed by a luxuriant vegetation, it often escapes notice. This is what is meant by the creoles when they say to strangers, “One should not come and live in Havannah without seeing the Havana.”

The American government having at this time acquired the territory of Wisconsin in the far west—one immense bed of galena and copper ore—Mr Sharp and a friend named O’Neil ‘closed for a tract of three thousand acres, one half to be paid in ready money, the other half in three years. Furnished with the necessary instructions, O’Neil started for our property, to examine into its resources, while I remained behind, in order to obtain the credit necessary to carry on our enterprise. The credit system in America has done a great deal of harm, but in principle it has been the cause of the immense progress of the country. Left to his own resources in a region where the earth, when properly managed, will yield forty or fifty per cent., the farmer, for want of a small capital, must remain for ever in mediocrity, and even in straitened circumstances. On the contrary, if he obtains a credit which the positive value of his property can cover, he may operate from the very beginning upon a large scale, and render more valuable not only his own lands, but also, through its relative vicinity, the district or even the country in which he lives.’ We suppose that Mr Sharp succeeded in obtaining all the credit he required, for in three years we find him and his partner so well established on their estate, that they were looked upon ‘as the two most important personages in the territory of Wisconsin. Our first establishment had become a city—Sharpville, with its fourteen hundred inhabitants, its land-

office, its three taverns, and its printing-office. O’Neil had been returned for the legislature, and I elected high sheriff.’ This magical progress is thus accounted for: ‘In the newly-settled countries of America, three years sometimes operate a wonderful change: the phases are often striking in the extreme, either in the way of prosperity or of ruin. When we first arrived on our property, it was a wilderness for fifty miles around. Then the repose of solitude was only broken by the loud roar of the mighty Wisconsin, rolling its turbid waters across a tract of dark eternal forests. But we had scarcely erected half-a-dozen miserable shanties [temporary huts] to shelter us during night, before twenty Canadians and as many Irish had already come to us as diggers. Being among the earliest miners, we had but to tear up the earth: wealth sprang from the wild valleys, where, a few years before, the lordly buffalo had been grazing undisturbed. Immediately after our first sale in galena, we raised up a saw-mill, and built thirty houses. Two months afterwards we had a post-office, two blacksmiths’ forges, three stores, and five hundred inhabitants. Twelve German families were planting and gardening; and as the final elections were at hand, we were courted for our votes. For these votes the government at Washington opened a road, which rendered easier and cheaper the transport of our ore along the banks of the Mississippi. For these votes the settlement was made a city, with all its privileges; finally, it became the capital of the county, having its court-house, its magistrates, and its recorder. Three years had, as I have said, gone by. By purchase after purchase, we had actually thirteen thousand acres of prime mineral land and nine smelting-houses. The territory was indebted to us to the amount of 160,000 dollars for roads opened and bridges thrown across the numerous streams intersecting the highway. We were immensely rich, and no longer in the wilderness. Attracted by the rumour of our success, hundreds of speculators had settled around us. Cities had sprung into existence on every point where the mineral was found; and the territory became so flourishing, that the tide of emigration from Europe poured on us its thousands, all of them considering our lead-digging as the Land of Promise—the Eldorado of the West.’ From this flourishing concern Mr Jonathan retired to New York with an ample fortune. He was disgusted with Sharpville in consequence of the cowardly assassination of his friend and partner O’Neil.

To remain long in one place was quite opposed to Mr Sharp’s restless disposition. He therefore turned his face towards the eastern hemisphere, choosing this island for his next visit, and Portsmouth for his landing-place. Thence he travelled to London; but a week in the great metropolis was enough for him, and he started for Ireland. At the end of a saunter all the way from Cape Clear to the Giant’s Causeway—relieved by a little fishing and some pleasant intercourse with the ‘finest peasantry in the world’—our truly go-a-head traveller received a letter from a Cuban friend, desiring an interview with him—in Madrid. In six days more, we find Mr Sharp landing on the shores of the far-famed Andalusia.

After this, he spent three years in travelling over the southern parts of the European continent. He returned to America. ‘What an age is ours!’ he exclaims; ‘motion, ever motion! So rapid too: in two days I had settled my business in London; sixteen days afterwards I was on the Exchange of New York, negotiating successfully.’ From Washington and Buffalo he returned to his own locality of Sharpville, to make a canal, and become a member of congress. In the former enterprise he was unable to succeed; but found it far less difficult to become a senator. Of his sayings and doings in congress Mr Sharp is silent, except that he was charged with a secret mission to Texas, which he appears to have performed with credit to himself.

In his third volume the restless Mr Sharp goes over much of the ground he has described in the two others. He revisits the Texas, Mexico, Cuba, and England,

winding up by some shrewd remarks on the 'annexation' question. We conclude with a curious story which he introduces in the course of his book, from the mouth of one of its heroes.

'In the year 1823, a French frigate, cruising off the coast of Burmah, had sent several boats on shore to procure wood and water. Four of the boats' crew committed some trivial offence during the execution of their duty, and after their return on board, received so severe a punishment that they determined to desert. They watched for an opportunity, and seizing one of the boats, landed during the night. Each had provided himself with a musket and a knife; but they were totally unacquainted with the country in which they were. They cared not, however; and began to travel westward, thinking that one day or another they should meet with some town in which, they said among themselves, such hearty fellows as they were would always be sure of having something to do. In the night they slept under trees; in the day they fed upon berries, and upon the few birds which chance threw in their way; but they never diverged from the straight line until, after a march of nine days, they found themselves upon the banks of a wide and rapid river: it was the majestic Irrawaddy. They knew they could not be far from the seashore; and thinking that such a stream would most likely have a port at its mouth, they altered their course, proceeding in a southerly direction. They were not disappointed in their reckoning. As they went on, they crossed numerous tracks of beasts of burden, and reached at last a Burman village, twelve miles from the sea. There they encountered several foreigners—two Spaniards, a Dutchman, two Jews from Smyrna, and a Scotchman, who acted as English agent, and kept a coalyard for the supply of the English steamers. The four deserters soon discovered that ropemaking would be to them a source of great profit; it was a part of their profession: they were industrious. In less than a week they had inspired the natives with so much confidence, that a house with a small portion of ground was allotted to them. They worked from morning to night, sold their ropes, learned a few words of the language, and before six weeks had elapsed, had surrounded themselves with comforts, having planted a garden with vegetables, and purchased a cow, pigs, and fowls.

'One day the French frigate anchored below the village. The Jews, jealous of the new comers, betrayed them to the officers, who endeavoured in vain to lay hands upon the fugitives. These were now much liked by the hospitable Burmans, who gave them warning, and sent them into the interior until the ship of war should leave the station, which she did three weeks afterwards. However, her captain, before sailing, left a note for the commander of an English steamer that was expected by the Scotch agent to arrive shortly. This of course the natives knew not, and as soon as they had ascertained that the frigate was fairly under weigh, they recalled their protégés, who returned in triumph, and gave a thrashing to the Jews. Some time after this event the steamboat made its appearance, and a lieutenant, with a dozen marines, presented himself before the dwelling of the runaways, summoning them to surrender. Determined, however, to do no such thing, they barricaded their door, managed to make a white flag, which they hung out of the window, and defied the marines to do their worst. The English officer charged with the capture of the sailors had accepted the task merely as an act of complaisance; but he did not like to employ force against four poor fellows resolved not to be taken alive, and who had put themselves under the protection of their national colours. Commanding his men to wheel to the right-about, he returned to his superior, to explain the matter to him. The captain, himself a man of energy, yet kind withal, went to the ropemakers to try the effect of a little gentle persuasion; but seeing that they were bent upon never re-entering the navy, he abandoned his purpose, and, touched with their gallant spirit, presented them with some arms and instruments, of which they were much in want.

'In two years' time the French sailors had rendered themselves so popular throughout the country, that the governor of the province, wishing to see them, sent an escort of fifty soldiers to bring them into his presence. He perceived at once that they would be of the greatest service to him, by helping to drill a corps of infantry, who, having no other arms than swords and pikes, could have no better instructors. Indeed, according to my new acquaintances, the troops of the province soon became renowned through-

out the empire: they fought in several engagements with success against a warlike tribe of the interior, which was utterly destroyed. The news having reached the ears of the emperor, the governor of the province, his army, and the four sailors, were ordered to the capital. Our adventurers then began a career of greatness: one became privy councillor to the monarch, another commander-in-chief of the Burman armies, the third was appointed to superintend the fortifications of the town, and the last was charged with the building of large sailing-boats, to serve as a foundation for the Burman naval power. They prospered till the death of the emperor, whose son did not show so much partiality to the strangers. They were dismissed from their offices, their property was confiscated, and they were ordered to quit the empire. They had saved, however, gold and jewels to a great amount, and possessed likewise several splendid pearl necklaces, given to them by the deceased monarch. Certain that they could not suffer from want, they procured a large pirogue, and descended the Irrawaddy as far as the hospitable village in which they had first experienced the kindness of the Burmans.

'They were exceedingly surprised to see it filled with foreign soldiers and sailors, both Americans and French, who seemed to be on the best terms with the natives. To their astonishment the French flag had changed. The spotless banner of the lilies had once more yielded to the tricolour, and Europe had witnessed a great revolution. Uncertain how they should be received in France, the adventurers, fearing that the late break-out at home would not exempt them from punishment, resolved to visit America, of which, long ago, they had heard so much. It was the land of liberty, equality, and social integrity.

'It happened, however, that the new emperor, hearing of the riches which the exiles had carried away, despatched a company of soldiers to arrest them, deliver them up to the French man-of-war, and bring back to him their treasures. But the good villagers, faithful to their former friendship, warned our heroes again of the coming danger, and, giving them provisions and ammunition, conveyed them to a deserted watch-tower on the seashore. There they fortified themselves, and defended their liberty during ten days against two hundred assailants, till both food and powder failed them. Meanwhile the Scotch agent, who was a truly kind man, lost no time in exciting in their favour the sympathy of the English officers. It was in 1842. Great Britain was at war with China. The Burman station was much resorted to by the vessels of every nation navigating those seas; but the English ships were the most numerous, on account of their greater need of fuel and fresh provisions. One of them, commanded by the same officer who had befriended the fugitives twelve years before, willingly undertook to help them out of their present difficult position. A boat, well manned, was sent on shore, in the immediate vicinity of the tower, which its occupants abandoned during the night, carrying with them their baggage and treasures. The benevolent captain scarcely recognised his old acquaintances in their new garb. Their complexion, naturally swarthy, had assumed the deepest olive hue, rendered still more apparent by the stainless whiteness of their flowing robes. They had saved a part of their wardrobe, and could still present a respectable appearance. Their well-combed beards descended low upon their breasts, and from under the folds of their turbans, their black hair, slightly tinged with gray, escaped in a profusion of curls, which gave to their physiognomy a remarkable type of manly beauty. They related their history to their kind protector, who treated them more as his equals than as his inferiors, till he had seen them safe on board a New York East India-man homeward bound.

'The wanderers had been only two weeks in America, but they were already anxious to leave it, declaring that it was a country fit only for people who had nothing to lose, and infinitely less civilised than Burmah. They wished to go to England, whence they would petition the French king to grant them an amnesty, and to allow them the favour of dying in their native villages. As they possessed property to a considerable amount, I advised them to take their passage in the steamer, and offered to accompany them to the office, to act as their interpreter. They thanked me gratefully. Two days afterwards we were on our passage to England.

'I may as well state here, that in London I helped them to dispose of their jewels, for which they obtained a fair value of upwards of ten thousand pounds. Their petition to their king was acknowledged almost immediately by a

full pardon for their past offence ; and they returned home, after an absence of twenty years—somewhat better off no doubt than if they had remained all that time in their former station.'

MARRIAGE CUSTOMS IN THE PROVINCES OF FRANCE.

AFTER all the political changes in France, the rural peasantry remain just what they were before the Revolution. Primitive in manners, few of them instructed in the elements of education, and visiting the large towns only on market or fête days, they continue to be a peculiar people, each province having its own costume, its own dialect, and its own habits and usages. Among the customs to which each district remains fixedly attached, none are so remarkable as those bearing on the all-important affair of courtship and matrimony.

In Touraine, the young peasant sometimes makes his first declaration to his mistress by affixing a bouquet to the door of the house in which she resides, and afterwards sends a friend to inform her of his intention of offering himself. Upon his first visit, he sees immediately, by the arrangement of the billets on the hearth, if his suit will be favourably received or not : if they are in the ordinary position, he will be accepted ; but if, on the contrary, they are placed on end and apart, he understands that his intended offer will be refused. When his suit is favourably received, he provides the marriage gifts, which consist of the wedding-ring, generally of gold, except with the very poorest class, who provide a silver ring ; but with the greater number, the usual offering consists, besides the ring, of a small gold cross, and frequently a silver cup, with a sum of money in proportion to his means. After the acceptance of these gages, the lady cannot retract without restoring all she has received. The wedding is usually fixed for a Monday or Tuesday, these being considered as the most propitious days ; and the bridal party assembles at the house of the lady's father, the bride wearing on the back of her cap a wreath of myrtle, and round her waist a ribbon of the length and form of the girdle of the holy virgin preserved in the collegiate church at Loches, as mentioned in the superstitions of the province ; which same ribbon she first wears on the day of her first communion, and afterwards when about to present her husband with an heir. Should the residence of the bride be at some distance from the village church, it is the custom for the miller employed by the family to convey her thither on his horse or mule, 'en trousse' behind him. During the wedding feast which follows the celebration, one of the young lads steals under the table, and endeavours to possess himself of one of the bride's garters, which is usually of rose-coloured or blue ribbon, and which, when obtained, is cut into pieces, and distributed amongst the guests, who affix it as a favour to their coat or hat. It is rare in the country for the female to bear the name of her husband without changing the termination into a feminine form ; for example, if the husband's name be Robin, the wife becomes Madame Robinne ; Flabeau becomes Flabelle. The husband also frequently adds the family name of his wife's family to his own. Charles Robin, for instance, marries Made-moiselle Goreau, and calls himself Robin Goreau. In the upper classes in Touraine, marriages are generally arranged by the lawyer of the family ; parties who have a son or a daughter to marry employing their legal adviser to find a suitable match, principally with regard to fortune. Marriages from the mutual inclination or attachment of the young people are of very rare occurrence.

In the department of L'Orme, in Normandy, an old woman acts as general plenipotentiary in marriage affairs, and makes the first proposal ; after which, if agreeable, she arranges a meeting of the parties interested.

In this part of France the carrying home of the *providing* reminds us of the old fashion in Scotland. On the evening before the wedding day, the men of the family arrive with a cart to carry the trousseau of the bride, the cart with the horse or oxen being adorned with ribbons, and preceded by a violin, which continues to play till the departure of the party, who pass some time in dancing ; and on their return, are still attended by the music, which never ceases its din ; and led by a sister or female relative, and in some cases by the dressmaker of the fiancée, who is provided with abundance of pins, which she distributes to every one she meets, and which it would be considered as a great insult to refuse ; besides which, these pins bring good luck, especially to the damsels who chance to receive them, who will consequently be married within the year—a kiss is always given and returned on receiving one of these well-omened gifts. On the wedding day, when all are assembled in their gayest attire, the sisters or nearest female relative attach a crown of flowers to the back of the bride's cap, and the party start for the church, still preceded by the violin, and accompanied by the firing of guns and shouts of the children. The family of the bride lead the procession on horseback, if they have any distance to go to the church ; then follows the bride 'en trousse' behind some near relative, and followed by the family of the bridegroom. On arriving at the church gate, the party arrange themselves in two lines, up which the damsel passes, leaning on the arm of the person who has brought her to church. On the arrival of the priest, the bridegroom conducts her to the centre of the building, where the nuptial benediction is given under a crucifix which is generally suspended from the ceiling. They then follow the priest to the high altar, where the gospel is read, during which time the couple kneel, each holding a taper, whilst over their heads a white canopy is supported by two of their relatives. The husband then leads his bride to the altar of the holy virgin, where they offer their tapers, and remain a short time in prayer. The cortège then leave the church, and proceed with the wedding guests to the breakfast. Before arriving at the house of her husband, the bride has to pass the barriers erected by her young friends, and which are formed of ribbons, garlands, and wreaths of flowers. In doing this, she distributes the pins with which they are fastened, with the flowers and ornaments, to those about her ; and, on arriving at the door, is received and embraced by her spouse, who also salutes his newly-acquired relatives. The cook then presents to the bride three loaves, which she distributes to the poor, who attend in a crowd, and all receive soup and bread. Whilst the bride takes possession of her new abode, it is the part of the bridegroom to betake himself to the kitchen, and aid in preparing the grand feast, towards which the guests contribute various provisions. The tables are placed in a horse-shoe form, and in the centre is a raised chair or throne covered with white linen, and ornamented with flowers, on which the bride is seated, with the principal guests on each side of her, whilst the bridegroom aids in the kitchen, and attends on the party. After dinner, dancing commences, the cook and the fiddler conducting madame round the circle, and introducing her to her new neighbours, to whom she again distributes pins ; after which the newly-married couple are seated on chairs, and the guests present their various gifts of linen, flax, yarn, wine, plate, and sometimes money. The relatives of the bride then carry the bride in procession, the violin sounding, and the guests singing an old and well-known song, used from time immemorial on such occasions. Afterwards the 'momons'—mummers or maskers—present themselves, mounted on wooden horses, called *bidoches*, which kick and prance to the great delight of the spectators ; they are attended by shepherds dressed with ribbons and flowers. About five o'clock the dancing begins again, and the cook has the privilege of dancing the first dance with the bride, the bridegroom the second ; after which he confides the lady

to his young friends. At nine o'clock the young lads of the neighbourhood appear, and the newly-married pair make their escape. The mirth and riot then waxes furious; they dance, eat, drink, and sing till the morning, when breakfast is served, and those who are in a state to reach their homes attempt to do so.

In Champagne, the affianced sends a piece of ribbon to all the girls in the neighbourhood above the age of seven or eight years, who present, in return, a dozen eggs, a fowl, butter, or other provisions for the wedding feast; and on leaving the church after the ceremony, a large dish of soup is presented, which is eaten in the churchyard by the wedding-party. Great importance is attached to this ceremony, which shows, it is said, the equality between the newly-married pair and the concord which ought to exist between them. In Mayenne, no such equality is allowed between the parties, and the peasants and smaller landholders keep their females in such subjection, that on the morning appointed for the nuptials the bride goes with her father to seek the bridegroom, who is always found in his working-dress, and asks the damsel why she should come for him, and she replies that perhaps he has changed his mind. He declares that such is not the case. This settles the affair; and after dressing for the ceremony, they proceed to the church, the marriage feast being always celebrated at the residence of the bridegroom. In the department of La Meurthe, in Lorraine, when the bride enters the house of her father-in-law after the ceremony, the mother of the young husband presents her with a plate of corn, eggs, and flax; the corn she scatters on the ground, preserving the flax and eggs. On the morning after the nuptials the young people of the neighbourhood carry a dish of soup to the newly-married couple before they are risen, and if not admitted, have a right to force open the chamber door. Afterwards, the two families attend a funeral service for the souls of their deceased relatives.

In some cantons of the department of the Landes, when a Landois wishes to marry, he goes to the house of the maiden's parents in the middle of the night, attended by two friends, each carrying a pitcher full of wine, knocks at the door, and requests an interview, which is never refused. The family all rise from their beds, seat themselves at the table, eat, and drink the wine, relate wonderful tales of seamen, sorcerers, ghosts, &c. without alluding in anyway to the cause of the visit. At daybreak the damsel rises from table to seek the dessert, which is the critical moment. If amongst the fruit she produces nuts, the suitor is rejected without any hope of being accepted.

A belief in the power of some disappointed rival to injure the bridegroom's happiness is very general, and various are the means to prevent any one from exerting this baneful influence. In Touraine, the brothers, cousins, or nearest male relatives, whose office it is on the marriage day to aid the bridegroom in putting on his new shoes or boots provided for the occasion, slip a piece of money into them; others carry in their pocket a small packet of salt. In the department of La Manche, a stout lad with an enormous whip precedes the newly-married man into the nuptial chamber, and makes a tremendous noise by cracking it, in order to drive away all evil spirits, enchanters, and contrivers of these deadly witch-knots, which cause the most fatal evils, instead of the love and harmony which should exist between the newly-married pair.

In some parts of Bretagne, the bride seems to adopt the old Roman custom of being carried off by violence; and towards the end of the day, endeavours to conceal herself, and sometimes does so for a day or two; at others she resists being taken from her father's house with such vigour, that her dress is torn to pieces, which is considered as a great credit to her; and the more vehemently she contends, the more respectable she is considered by her neighbours and friends. Notwithstanding all the innovations which modern civilisation has made in the habits and manners of the people, the

various customs enumerated still remain in the different departments unaltered, and apparently unlikely to change for ages to come.

THE ELEPHANT IN INDIA.

[Translated from Von Orlich's *Reise in Ostindien*, 'Travels in India,' an expensive volume, published at Leipzig under the patronage of the king of Prussia.]

In the neighbourhood of Sumalka, a town not far from Delhi, lying amongst ancient and beautiful tamarind trees, fig trees, and acacias, is the encampment of our one hundred and twenty elephants. To this place I frequently and gladly go for the purpose of watching this sagacious beast. By reason of the persecution it has endured from man, either merely for the pleasures of the chase, or that when tamed it might increase the splendour of state, or serve as a beast of burden, and render assistance in battle, the elephant has nearly disappeared from the interior of India, and is found wild only in the less elevated portion of the Himalayan chain; namely, in the forests of Dehenna, Nepaul, some parts of Ghauts Tarra, the kingdom of Ava and Ceylon. On the upper Indus, near Attock, where Alexander the Great had his first elephant hunt, in the Punjab, and on the banks of the Jumna, not far from Kalpy, where the Emperor Baber was annually accustomed to enjoy the chase, and capture many of these animals, there is not now a trace of this noble beast to be found. Although this hand-endowed animal was used in the earliest times as an instrument of war, and it was known how to render it an obedient servant, it has never yet been possible to domesticate it so as to render it productive after being tamed. Individual instances have certainly occurred where tame elephants have produced young, and I myself saw a ten months old animal belonging to a rajah, which had been born under these circumstances. Whether they are afraid that a degenerated species would be the consequence, or whether the need of a complete domestication has never been experienced, and they are content with reclaiming each individual, I am not able to say.

I experienced a singular feeling of novelty and excitement the first time of riding upon this creature. There is first placed upon its back a cushion thickly stuffed with hair, for this is the tenderest part of the elephant, and the greatest care of the attendant is to guard against all injury at this place, the more especially as wounds are difficult to heal. Over this cushion there is thrown a long hanging cloth, red and embroidered with gold, upon which the houdah rests fastened with cords and girths. The houdah is made to contain two persons and their servant. The mahoud sits upon the neck behind the creature's ears, guiding it with an iron fork, one prong of which is curved out, whilst a man runs alongside with a large staff, and hastens its advance by blows or cries. A ladder hanging at one side completes the appointments. When it is desired to mount the elephant, the mahoud cries *beil, beil*, that is, 'lie down, whereupon the animal kneels down, the ladder is ascended, and the rider takes his seat. The gait of the animal of course regulates the motion of its rider; sometimes it is pleasant, sometimes fatiguing. Its pace when urged onward is so quick that a horseman must trot to keep by its side; but he soon slackens his speed, and it is not without difficulty that he accomplishes twenty-four miles a-day. To cool himself, or to remove dust, he now and then sprinkles himself with water drawn up into his trunk. An ordinary elephant costs 1000 rupees (£100), and his keep forty rupees a-month.

In its wild state the elephant attains an age of upwards of two hundred years; but when tamed, not much more than one hundred and twenty. Its size is various; those of Ceylon and Tarra are small, and seldom have tusks. A hunter of great experience told me that in Ceylon scarcely two in a hundred have tusks. As soon as an elephant thus armed is caught, the greater portion of his tusks is sawn off, and the extremities of what remains are encased in gold or silver. The largest animals that came under my observation belonged to the governor-general, the maharajah of Lahore, the king of Oude, and the rajahs of Bhurtpoor and Alwar, and these were about eleven feet high. They were also more agile, and of greater endurance and sagacity than is usual. Such an animal would cost about 5000 rupees, whilst one of seven feet high can be bought

for a thousand. The ordinary elephant, having five times the strength of a camel, is employed in the army to bear not only the chief persons and the sick, but also the tents and furniture. It can likewise be quite as serviceably employed as a draught-beast, since it can pull with the greatest ease what ten horses have scarcely power to move. The English have, in consequence, recently yoked it to their artillery-carriages with the best result. On the other hand, it is very difficult to induce the elephant to cross a river, for when he enters it is not easy to guide him in the proper direction, and he sinks so low that only the tip of his proboscis, which he lifts on such an occasion as high as possible, is visible. If he has to cross a bridge of boats, or a piece of fenny land, he ascertains the safety of his path by means of his trunk, and before he sets his foot down, he tests the strength of the support. To testify his pleasure, he lifts his trunk perpendicularly upwards; and his mahoud teaches him to raise his trunk and fall on his knees when he comes into the presence of a great man. In tiger-hunting the elephant is especially useful, not only for carriage but for defence. The chase takes place in the thick overgrown jungles, where it would be impossible for horsemen and persons on foot to penetrate through bushes and reeds sixteen feet high, and over swampy ground. The months of April and May are most favourable for hunting, because then the tiger seeks his food more daringly, approaching the abodes of men for the purpose of carrying off the cattle, and thus he is more easy to be met with. Each sportsman takes two rifles of a stronger make in his houndah, and the gunner takes the place of the servant. A large party is usually made up for a tiger-hunt, and the elephants are carefully selected with reference to previous experience and efficiency. As soon as the tiger is tracked to his lair, he endeavours to slink away, but he stands upon his defence the moment a shot touches him; and when wounded, he sends out a terrific roar, showing at the same time his teeth. Everything depends at this period of the tumult upon the elephant not turning his back on his antagonist. Most elephants show great skill in defending themselves with their trunk, so as to give the sportsman time to lodge another ball. The elephant manifests great delight when the tiger is killed, and experienced hunters have assured me that he becomes bolder and more active with his victories. When the hunter quits his elephant, and leaves him to contend with the tiger alone, it is difficult to make him useful afterwards. As soon as the elephant is freed from his burden, a stake is driven into the earth to which a fore-foot is fastened by a chain. Upon occasions of festivity, the mahouds take much pains to paint his head and trunk with arabesque designs in white, red, yellow, or blue. They bestow great attention on the animal confided to their care. A mahoud never curtails an elephant of his food, or leaves him entirely without support. The tent in which he, his wife, and children are lodged, is placed near the elephant, so that the animal almost lives with them. While the mahoud cooks a cake of cascaded flour upon an iron plate, his charge stands patiently by until the cake is cool, and then he receives his sustenance out of the hands of the family. The elephant is passionately fond of the sugar cane. One of the beasts which were fed to-day upon canes, quite lost all patience when he saw his neighbours munching their favourite viand, himself apparently having been forgotten. Just as a rough boy stamps with his foot if his wishes are not complied with, this elephant angrily struck the earth with his trunk, but the moment his food was brought he was quiet. He is fond of throwing leaves and bits of earth upon his back, and in idle hours this is a never failing resource. Still more does he delight in turning himself over in the water. When his keeper cleans him, he patiently kneels down, or places himself on his side.

So full of reason are his actions, that he serves the Indians as the symbol of the highest knowledge; Ganesea, the god of art and science, being represented with an elephant's head. More especially is this animal honoured by the Hindoos, who make it the companion of the gods, the warder of the porch of the temple, the caryatide and ornament of their architecture. They believe that the souls of princes and Brahmins do penance in the bodies of elephants, and a Hindoo of low caste may hold one of them to be higher than himself. A bride, according to the law of Menu, should have the graceful gait of a flamingo, or of a young elephant; and therefore at this day the princes and princesses of the ancient Hindoo dynasties are taught the step of an elephant. When the rajah of Bickaneer came to

visit Lord Ellenborough, he entered the tent with a heavy tread, conformably to the instruction he had received in this branch of Indian etiquette.

For purposes of splendour the elephant plays an important part in the immense retinues of great persons in India. When Sir Jasper Nicholls, the commander-in-chief during the late war, arrived at the camp at Ferozpoor, eighty elephants swelled his train. He had in addition three hundred camels, and one hundred and thirty-six draught-oxen. Above a thousand servants were present merely for Sir Jasper's personal service, and to attend to the animals. When the governor-general made his entry, he brought along with him one hundred and thirty elephants and seven hundred camels.

SPECULATIVE PHILANTHROPISTS.

That each man shall be free in the choice and practice of his trade or calling—that the field of competition shall be open to all—that each individual shall be permitted to make the best bargain he can, whether for the wages of his labour or the price of his commodities—all these trite but invaluable maxims are incessantly decried, and nothing is heard of but the evils of competition, and the unequal recompense of labour. In their fits of impotent benevolence, these speculative physicians assail, as the cause of the existing distress, those principles which, in fact, are the conditions of all the prosperity we have attained, or can preserve, or can hope in future to attain. This title of the individual, whether workman or capitalist, to the control and conduct of his own affairs—this 'fair field and no favour' system—is not to be described as if it were a mere theory of political economy, and disputable like some other branches of science not yet matured. It is the great conquest of modern civilisation; it is the indispensable condition to the full development of the activity and enterprise of man. The liberation of the artisan and the labourer is the signal triumph of modern over ancient times, whether we regard classic or Gothic antiquity. Viewing things on a large scale, it may be considered as a *late* triumph; and, without depreciating its value, we may easily admit that there remains much to be done in the cultivation of the artisan, to enable him to govern himself, and make the best of his position. But any scheme which, under the pretext of ameliorating his position, would place him again under tutelage, is a scheme of degradation, and a retrograde movement. He is now a freeman, an enrolled member of a civilised state, where each individual has to a great extent the responsibility thrown upon himself for his own wellbeing: he must have prospective cares, and grow acquainted with the thoughtful virtue of prudence. That release from reflection and anxiety for the future which is the compensating privilege of the slave or the barbarian, he cannot hope any longer to enjoy. Whatever its value, he must renounce it. He must become one of us, knowing good and evil, looking before and behind. In this direction—in the gradual improvement of the labourer—lies our future progress; progress slow and toilsome, little suited to the socialist who calculates on changing, as with the touch of a wand, the whole aspect of society.—*Blackwood's Magazine*.

THE SISTER OF GEORGE III.

Dinner at the duchess dowager's: great anxiety and urgency to know whether my messenger brought me my full powers, and great disappointment at hearing he had not. I took an opportunity of mentioning to the duke that I wished to speak with him, and he appointed me at my own house the following day. Duchess very inquisitive—against his taking the command; not for his going to Holland. Said she knew his refusal had hurt the king very much. She talked of Edward Duke of York as her favourite brother; said she recollected he liked my father; praised the Duke of Gloucester; abused the queen, who, she said, was an envious and intriguing spirit; told several anecdotes to this effect on her first coming over; that she disliked her mother (the Princess of Wales) and herself, and was extremely jealous of them: took an opportunity, while the Princess of Wales was dying, to alter the rank of the ladies of her bed-chamber. King very good, but not liable to deep impressions. Talked slightly of the Duke of York; said he behaved badly here to his duchess. I defended him. She reproached his conduct at Hanover, and particularly that to his old flame, Madame de ———, to whom, on his return to England with the duchess, he did not

peak. The Duchess of York, she said, behaved vastly well on this occasion. She then got on the marriage of her daughter—acquainted me with all the injunctions and advice she had given her, which were very excellent—declared her own intention of never coming to England—that she was sure she should be uncomfortable there, and give rise to all sorts of jealousy and suspicion; said she had enough of that—praised exceedingly her daughter-in-law, the hereditary princess, and admired particularly her behaviour to her son. 'Had I married such a man as Charles,' she said, 'I never could have behaved so.' Abused the Landgrave of Hesse, and her sister the Duchess of Hertenberg—told me that the Landgrave was once thought of for the king, but that her conduct was so doubtful that nobody could take upon them to recommend her. All the young German princesses, she said, had learned English in hopes of being Princess of Wales. She never would give the idea to Caroline; and she never thought it could happen, as the king had often expressed his dislike to the marriage of cousins-german. Nothing could be so open, so frank, and so unreserved as her manners, nor so perfectly good-natured and unaffected. Of the king, her brother, she said he loved her very much, as well as he could love anybody, but that twenty years' absence, and thirty years' living with the queen, had made him forget her; yet he was very kind indeed on the present occasion. She said that Queen Charlotte was very much hurt at the very fine diamond ring the king gave her (the duchess), as a *bague de mariage*, in 1764; that she wanted it back, and was quite peevish about it. This ring and a pair of bracelets were the only diamonds she brought with her from England. Declared she would never allow Caroline to have her brothers with her—that it would make her unpopular—that the queen did it to get them money—that it was shabby, &c. Said the king offered her a princess for her son, if she would first let him come over and be seen. The duchess replied, 'that Charles was a very good-humoured, harmless boy—would certainly make a good husband; but she would not send him over, as she was quite sure, if he was to show himself, none of the princesses would have him.'—*Diary of the Earl of Malmesbury.*

PUBLIC HOT-WATER BATHS IN CHINA.

In the town of Shanghai, as well as in many other large Chinese towns, there are a number of hot-water bathing establishments, which must be of great importance as regards the health and comfort of the natives. Let me describe one which I passed daily during my residence in Shanghai. There are two outer rooms used for undressing and dressing: the first and largest is for the poorer classes; the second for those who consider themselves more respectable, and who wish to be more private. As you enter the largest of these rooms, a placard which is hung near the door informs you what the charges are, and a man stands there to receive the money on entrance. Arranged in rows down the middle and round the sides of both rooms are a number of small boxes or lockers, furnished with lock and key, into which the visitors put their clothes, and where they can make sure of them when they return from the bathing-room. The bathing-room is entered by a small door at the farther end of the building, and is about thirty feet long and twenty wide; the bath occupying the whole space, except a narrow path round the sides. The water is from one foot to eighteen inches deep, and the sides are lined and covered with marble slabs, from which the bathers step into the water, and on which they sit and wash themselves: the furnace is placed on the outside of one of the ends, and the flues are carried through below the centre of the bath. The establishment in the afternoon and evening is crowded with visitors, and on entering the bath-room, the first impression is almost insupportable: the hot steam or vapour meets you at the door, filling the eyes, ears, and causing perspiration to run from every pore of the body: it almost darkens the place; and the Chinamen seen in this imperfect light, with their brown skins and long tails, sporting amongst the water, render the scene a most ludicrous one to an Englishman. Those visitors who use the common room pay only six copper cash; the other class pay eighteen; but they in addition have a cup of tea and a pipe of tobacco from the proprietors. I may mention that one hundred copper cash amount to about 4d. of our money; so that the first class enjoy a hot-water bath for about one farthing, and the other a bath, a private room, a cup of tea, and a pipe of tobacco, for something less than one penny.—*Correspondent of Athenæum.*

WHERE WOULD I BE?

[FROM THE GERMAN OF E. WOLFF.]

Where would I be?

There, where the rosy wine pearls to the brim;
There, where due honours crown the poet's hymn;
There, where the foaming Rhine bounds to the sea!
There would I be.

Where would I be?

There, where success attends the good and brave;
There, where the gallant skiff light rides the wave;
Even where on rugged rocks the brave live free—
There would I be.

Where would I be?

Where slaves themselves pluck off the bond of shame,
And leap and bound in many a manly game;
Where Freedom's eagle breathes her glorious way
Through the wide ether in the blaze of day,
With god-like might where slaves themselves set free—
There would I be.

Where would I be?

Where, for a life's time, two fast friends have gone,
Through weal and wo, and lived and loved in one;
Brave, and devoted in firm unity—
There would I be.

Where would I be?

Where the one darling of my heart should rest,
Her gentle bosom to my bosom prest,
And gaze for ever with undying bliss
Within my eyes: breathe one immortal kiss
Throughout thy length and breadth, eternally—
There would I be!

E. L.

CLIMATE OF KORDOFAN.

The climate of Kordofan (in Central Africa), says Ignatius Pallme in his travels, is very unhealthy, especially during the rainy season; no hut is then indeed to be met with in which there are not several sick. In the dry season, again, all disease disappears: at this time, however, not only man but all living creatures suffer from extreme heat. The eye then rests with melancholy on the desolate and parched plains, trophies of the victory of the heat over animated nature, where nothing is to be seen but bones of men and animals bleached by the burning sun. During the whole of this season, which endures for eight months, the sky is clear and cloudless, and the heat is insupportable, especially in the months of April and May. From 11 o'clock in the forenoon till 3 in the afternoon, when the thermometer stands in the shade at 117 or 122 degrees Fahrenheit, it is impossible for any breathing creature to remain in the open air. Every living being, both men and cattle, with equal eagerness seek the shade, to protect themselves from the scorching rays of a fierce sun. Man sits during these hours as if in a vapour bath; his cheerfulness of disposition declines, and he is almost incapable of thought; listless, and with absence of mind, he stares vacantly before him, searching in vain for a cool spot. The air breathed is hot, as if it proceeded from a heated furnace, and acts in so enervating a manner on the animal economy, that it becomes a trouble even to move a limb. All business ceases; everything is wrapped in a sleep of death, until the sun gradually sinks, and the cool air recalls men and animals again into life and activity. The nights, on the other hand, are so sharp, that it is necessary to be more careful in guarding against the effects of cold in this country than in the northern parts of Europe; for the consequences often prove fatal. During the dry season, everything in nature appears desolate and dismal; the plants are burnt up; the trees lose their leaves, and appear like brooms; no bird is heard to sing; no animal delights to disport in the gladness of its existence; every living being creeps to the forest to secrete itself, seeking shelter from the fearful heat; save that now and then an ostrich will be seen traversing the desert fields in flying pace, or a giraffe hastening from one oasis to another.

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF 'CHAMBERS'S INFORMATION FOR THE PEOPLE,' 'CHAMBERS'S EDUCATIONAL COURSE,' &c.

No. 78. NEW SERIES.

SATURDAY, JUNE 28, 1845.

PRICE 1^d.

PRESENCE OF MIND.

THE differences of the conduct of individuals in situations of danger and sudden emergency are very striking; nor do we always find the best conduct in such circumstances from those who act best in the ordinary affairs of life. Often has it happened that a clever shrewd man of the world, such as the late Mr Huskisson, has lost all reflection and power to act when unexpectedly overtaken by danger; and not less frequently do we see prompt and vigorous conduct manifested, on like occasions, by women who have never before given token of their being in any respect endowed above their neighbours. Presence of mind thus appears as something not necessarily to be found in union with high intellect or skill. A cunning bravery of the timid, a cowardly, but laudably cowardly adroitness of the brave, it sometimes almost appears as an inspiration; and yet we know that it is but a natural endowment, capable, like all others, of being cultivated in everybody by the use of appropriate means. I have heard of a gentleman who took his son to bathe, and actually threw him into a situation of danger, in order to elicit and train his presence of mind: we also know that barbarous nations of warlike character use similar methods with their youth, by way of fitting them for every kind of peril and ambushade. It is not, perhaps, desirable that any such plans should be resorted to in our present civilised circumstances; but certainly there is much need to prepare the minds of the young for difficulties and crises, by a full explanation of such as are still likely to occur in the course of life, and by accustoming them as far as possible to habits of prompt action and self-reliance. Much might be done in parlour existence, merely by establishing a certain cool manner for the treatment of all extraordinary matters; for we are so greatly creatures of habit, that, if we allow ourselves to be thrown into an excitement by all the little out-of-the-way occurrences of life, we are extremely likely to be thrown into a paroxysm of the same feeling by events of greater moment; nor is it less true that a steady and sober way of viewing small matters will fit us for viewing great ones without the excitement which produces confusion of mind. I verily believe that the stupid habit of getting up a clamour about trifles, has led in many instances to that wildness of alarm in cases of danger which not only forbids escape to the unhappy being exhibiting it, but tends to paralyse and endanger others. The general safety often depends on an entire suppression of excitement and outcry, and it is therefore of the greatest consequence that every person should be trained to a *quiet*, not to speak of a firm manner of acting under trivial difficulties.

The value of such conduct on occasions of peril involving many lives, was never perhaps better exem-

plified than in the destruction of the Kent East Indiaman by fire, when not even from the women and children was one sound of alarm heard, the consequence of which was, that the officers and sailors were enabled to do all that was possible in the circumstances for the preservation of the people on board, and the whole of the procedure connected with their transference to the saving vessel was conducted with as much regularity, and almost as much safety, as if it had taken place on an ordinary occasion. In striking contrast was the scene on board the Halsewell, where the two daughters of the captain, losing all self-command, threw themselves upon their father with such frantic cries and lamentations, as overwhelmed his naturally intrepid mind, and thus extinguished the energies upon which at the moment so much depended.

We so continually, in the journals of the day, see evil consequences from want of presence of mind, in circumstances where the proper conduct has long been generally agreed upon, that we might be tempted to believe it a quality beyond mortal reach, if we were not aware how many things, which appear notorious to all, are in reality unknown to many. Hardly a week passes without telling us of a female having caught fire and lost her life in consequence of rushing out into the open air, instead of rolling herself in a carpet, or at least prostrating herself on the floor. Panics still occasionally take place in theatres and churches, and scores of lives are lost by a crowding to the door: not one instance do I remember of an alarm in such places of resort being attended by the proper conduct—*sitting still*. Individuals are also still much given to throwing themselves out of runaway carriages, an act which may be pronounced the very opposite of the proper conduct. But the fact is, that, while some of these errors are a consequence of mere confusion of mind, many are also the result of ignorance. The right conduct in situations of difficulty is far from being generally impressed, as it ought to be, on the minds of the young. Or, if it has been taught as a lesson, there has at least been no effort to train the mind to look to it as the only course of action in which there is the least safety; so that when the critical moment arrives, we are still too prone to act upon some mere instinct for self-preservation. A young lady, a few years ago, caught fire while going to bed in a country house where she was a visitor. She had been told that the carpet and the floor were the proper expedients; but a more immediate impulse directed her to a lake in front of the house. She rushed along the passages and stairs, and was found exhausted, and almost hopelessly scorched, a few yards from the outer door. It is necessary to make the lesson a vital principle in the mind.

Presence of mind is exemplified in its simplest form,

where all that is necessary is to take a deliberate view of the circumstances, and then do that which seems most advantageous. It may be shown, for example, in a choice between the door and window in a case of fire, or in the selection of something to be saved, as that which is most important. In the year 1716, when a captain came with his troop to execute the vengeance of the government upon the house of a Jacobite gentleman in Perthshire, he humanely gave the inmates a few minutes to remove whatever they deemed most valuable. A lady, the sister of the absent landlord, flew to the store-room, thinking to save the plate; when she afterwards inspected the contents of her apron on the lawn, she found, too late, that she had only rescued a quantity of old candlesticks, butter-boats, and similar trash. A gentleman just escaped from a fire in his house, joyfully told his congratulating friends that, in the midst of the confusion, he had been able to open a drawer and save his principal papers. He emptied his pockets, and found only scraps of no use, which had chanced to lie in the same place. I have also heard of a gentleman and his wife who escaped with the greatest difficulty from their burning house, he bearing, as he thought, their infant in his arms. It proved to be but a pillow which he had snatched up in his haste! A moment devoted to a steady, thoughtful consideration of the circumstances, might in all these cases have been attended with the opposite consequences.

Presence of mind is occasionally shown in quick conception of some device or expedient, such as we usually suppose to be an emanation of superior intellect. This has been repeatedly exemplified in rencontres with the insane. A lady known to me was one evening sitting in her drawing-room alone, when the only other inmate of the house, a brother, who for a time had been betraying a tendency to unsoundness of mind, entered with a carving-knife in his hand, and shutting the door, came up to her and said, 'Margaret, an odd idea has occurred to me. I wish to paint the head of John the Baptist, and I think yours might make an excellent study for it. So, if you please, I will cut off your head.' The lady looked at her brother's eye, and seeing in it no token of a jest, concluded that he meant to do as he said. There was an open window and a balcony by her side, with a street in front; but a moment satisfied her that safety did not lie that way. So putting on a smiling countenance, she said, with the greatest apparent cordiality, 'That is a strange idea, George; but wouldn't it be a pity to spoil this pretty new lace tippet I have got? I'll just step to my room to put it off, and be with you again in half a minute.' Without waiting to give him time to consider, she stepped lightly across the floor, and passed out. In another moment she was safe in her own room, whence she easily gave an alarm, and the madman was secured.

The story of the gentleman commanded by some insane persons to jump from the top of a tower in their asylum, and who escaped by telling them he would rather jump from the bottom to the top, and ran down stairs as if to execute his intention, is well known; but the following anecdote of a similar situation will be new to most readers:—A gentleman accompanying a party to inspect an asylum, chanced to be left behind in the kitchen amongst a number of the inmates who acted as cooks and scullions to the establishment. There was a huge cauldron of boiling water on the fire, into which the madmen declared they must put him, in order to boil him for broth. They would fain have assisted him into the large pot; and as they were laying hold of him, he reflected that in a personal struggle he would have no chance with them—all he could do was to endeavour to gain time. So he said, 'Very well, gentlemen, I am

sure I should make good broth, if you do not spoil it by boiling my clothes with it.' 'Take off your clothes,' they cried out; and he began to take off his things very slowly, calling out loudly the whole time. 'Now, gentlemen, my coat is off—I will soon be stripped. There goes my waistcoat—I shall soon be ready;' and so on, till nothing remained but his shirt. Fortunately, the keeper, attracted by his loud speaking, hurried in just in time to save him.

Some anecdotes of escapes from assassins and robbers, by the prompt exercise of presence of mind, are much to the same purpose. A young man, travelling in one of the public coaches, was much interested by the accounts of robberies which his fellow-passengers were detailing. An old gentleman mentioned that he always took the precaution of secreting his money in his boot, merely keeping silver for his incidental expenses in his pocket. The old gentleman appeared to be captivated with the politeness and intelligence of the young man, to whom he addressed much of his conversation, who on his part was equally pleased with the kindness and urbanity of his elder companion. Thus some hours had passed agreeably, when, just at night-fall, as they were passing a wild and lonely moor, the coach was stopped by robbers, who rifled the pockets of those nearest to them, giving the old gentleman a hearty execration for having his purse so badly furnished. They came last to the young man, who was seated in the far corner, and demanded his purse. 'I never carry any money,' said he. 'We'll not take your word for that,' said his assailants. 'Indeed I don't,' said the young man; 'my uncle always pays for us both, and there he is,' continued he, pointing to the old gentleman, 'and he has got our money in his boot.' The old gentleman was dragged from the coach, his boot pulled off, and three ten-pound notes were found. He was then suffered to resume his seat, and the coach drove on. Hot was his anger, and bitter were his upbraidings, against his betrayer, whom he did not hesitate to accuse of both treachery and pusillanimity. The young man listened in silence, as if ashamed and conscience-stricken. They passed over some miles, and at length reached an inn by the wayside. The travellers alighted, and, on going in, the young man requested the old gentleman would allow him to say a few words in private. They retired into a room by themselves. 'I have not only to ask your pardon, my dear sir,' said the young man, 'but to thank you for the fortunate expedient with which your confidence furnished me, and to hand to you the sum of thirty pounds in lieu of that which I appeared so unceremoniously to point out to the robbers. I am sure you will forgive me, when I tell you that the note-case in my pocket contained notes for £500, the loss of which would have been utter ruin to me.' It need scarcely be added that the adopted uncle shook hands cordially with his young acquaintance, and took him into more marked favour than ever.

One of the most striking cases of presence of mind and self-possession of which I have any recollection, came to light in a trial which took place some years since in Ireland. The story looks like a fiction; but I have reason to believe it quite true. A woman travelling along a road to join her husband, who was a soldier, and quartered at Athlone, was joined by a pedlar, who was going the same way. They entered into conversation during a walk of some hours; but as the day began to wane, they agreed that they would stop for the night at a house of entertainment, and pursue their pedestrian journey the next day. They reached a humble inn, situated in a lonely spot by the road-side; and, fatigued after their long day's walk, they were glad to find themselves under the shelter of a roof. Having refreshed themselves with the substantial supper set before them, they expressed a wish to retire. They were shown into the traveller's room, and went to rest in their respective beds. The pedlar, before retiring, had called the landlord aside, and given into his keeping the pack, which he had unstrapped from his back, till the morning, telling him

that it contained a considerable sum of money and much valuable property. They were not long in bed before the pedlar fell into a deep sleep; but the poor woman, perhaps from over-fatigue, or from thoughts of meeting her husband next day, lay awake. A couple of hours might have passed, when she saw the door slowly opened, and a person enter holding a light, which he screened with his hand. She instantly recognised in him one of the young men she had seen below—son to the landlord. He advanced with stealthy steps to the bedside of the pedlar, and watched by him for a few seconds. He then went out, and entered again with his brother and his father, who held in his hand a large pewter basin. They went on tiptoe to the bedside, where the pedlar lay in a deep sleep. One of the young men drew out a knife, and while the father held the basin so as to receive the blood, he cut the poor victim's throat from ear to ear. A slight half-audible groan, and all was still, save the cautious movements of the party engaged in the fatal deed. They had brought in with them a large sack, into which they quickly thrust the unresisting body. The poor woman lay silently in her bed, fearing that her turn would come next. She heard low mutterings among the men, from which she soon gathered that they were debating whether they should murder her too, as they feared she might have it in her power to betray them. One of them said he was sure that she was sound asleep, and that there was no occasion to trouble themselves more; but to make sure of this being the case, one came to her side with the candle in his hand, and the other with the knife. She kept her eyes closed as if in sleep, and had such complete command over herself, as not to betray in her countenance any sign that she was conscious of what was going on. The candle was passed close to her eyes; the knife was drawn across close to her throat; she never winced, or showed by any movement of feature or of limb that she apprehended danger. So the men whispered that she was so soundly asleep that nothing was to be feared from her; and they went out of the room, removing the sack which contained the body of the murdered man. How long must that night of horror have seemed to the poor lone woman—how frightful its stillness and its darkness! The presence of mind which had so astonishingly enabled her to act a part to which she owed her life, sustained her all through the trying scenes which she had yet to pass. She did not hurry from her room at an unseasonably early hour, but waited till she heard all the family stir for some time; she then went down, and said she believed she had overslept herself, in consequence of being greatly tired. She asked where the pedlar was, and was told that he had been in too great a hurry to wait for her, but that he had left sixpence to pay for her breakfast. She sat down composedly to that meal, and forced herself to partake with apparent appetite of the food set before her. She appeared unconscious of the eyes which, with deep scrutiny, were fixed upon her. When the meal was over, she took leave of the family, and went on her way without the least appearance of discomposure or mistrust. She had proceeded but a short way, when she was joined by two strapping-looking women: one look was sufficient to convince her that they were the two young men, and one thought to assure her that she was yet in their power, and on the very verge of destruction. They walked by her side, entered into conversation, asked her where she was going, told her that their road lay the same way: they questioned her as to where she had lodged the night before, and made most minute inquiries about the family inhabiting the house of entertainment. Her answers appeared quite unembarrassed, and she said the people of the house had appeared to be decent and civil, and had treated her very well. For two hours the young men continued by her side, conversing with her, and watching with the most scrutinising glances any change in her countenance, and asking questions which, had she not been fully self-possessed, might have put her off her

guard. It was not till her dreaded companions had left her, and till she saw her husband coming along the road to meet her, that she lost the self-command which she had so successfully exercised, and throwing herself into his arms, fainted away.

But there is a still more painful test to which presence of mind may be put than even personal danger, however great. It is when, seeing a beloved object in imminent peril, one inadvertent word, one passionate exclamation, one burst of sensibility, might increase the risk tenfold. It were needless to insist on the urgent necessity of presence of mind, in the form of self-command, at such a time, and I will merely illustrate the subject by an example where the strongest sensibilities of our nature were suppressed, while some, without one particle more of affection, but many thousand degrees less of sense and self-control, would have screamed, or fainted, or acted so as to hurry on the catastrophe most dreaded. A lady with whom I am acquainted, one day returning from a drive, looked up and saw two of her children, one about five, and the other about four years old, outside the garret window, which they were busily employed in rubbing with their handkerchiefs, in imitation of a person whom they had seen a few days before cleaning the windows. They had clambered over the bars which had been intended to secure them from danger. The lady had sufficient command over herself not to appear to observe them; she did not utter one word, but hastened up to the nursery, and instead of rushing forward to snatch them in, which might have frightened them, and caused them to lose their balance, she stood a little apart, and called gently to them, and bade them come in. They saw no appearance of hurry or agitation in their mamma, so took their time, and deliberately climbed the bars, and landed safely in the room. One look of terror, one tone of impatience from her, and the little creatures might have become confused, and lost their footing, and been destroyed.

It has sometimes happened that, in hurry and confusion, a wrong medicine has been administered by the hand of one who would have sacrificed life to save a beloved object from the danger with which they were threatened by a sudden illness or accident, and who, had they preserved their presence of mind, might have been spared one of the bitterest misfortunes that can be conceived. To have self-possession in such a case may be life and health to one who is everything to us. It may happen, too, that illness or accident may overtake us while away from medical aid, or distant from any friend. The great advantages of presence of mind in such cases struck me very forcibly when I heard Captain W— relate the following anecdote:—He was a young man when he served under General Abercromby as an ensign at the battle of Alexandria. His leg was carried off by a cannon-ball. He of course instantly fell, and remained stunned for some time. On recovering his recollection, he found his wound bleeding profusely, and no assistance near. The forces had left the field in such haste, as to be unable to attend to the wounded and the dying, who were now his only companions. He loosened his sash, and bound it as tightly as he could about the wound, and seeing a dead soldier lying near, he stretched out his hand and seized his bayonet; he then thrust it through a knot which fastened the sash, and twisted it tightly, thus forming a tourniquet, which so effectually stanching the blood, that when he was found some hours after, the great effusion had ceased. No doubt he would have been numbered with the dead, but for the extraordinary presence of mind which at once suggested the only mode by which he could be saved. He eventually recovered, and still lives.

Presence of mind may also be brought to bear with good effect in many of the trivial conjunctures of life. It is often shown in a ready answer, turning anger into good humour, or overturning a false accusation, which otherwise might have proved troublesome. There can

be no question that it may be improved for serious emergencies by being cultivated in these familiar and more simple cases. But there is one caution to be observed. Let presence of mind be used only as a defence. When employed for purposes of deception, or to advance selfish objects, we may admire it as an intellectual feature, but regret must at the same time arise that the direction given to it is one in which we cannot sympathise.

THE UNJUST JUDGE.

[BY MRS S. C. HALL.]

It was an old lady who related to me the following incident. As it supplies evidence how strong a moral may be inculcated by a picture, I will endeavour to record it in her own simple words. When I knew her she was very aged; her sitting-room was adorned by paintings, generally of the higher class; but sometimes the sentiment, the conception of a subject, was so superior to its execution, that I imagined she had more feeling than knowledge with regard to works of art. She moved about her apartment, leaning on the arm of her grand-niece, and pointing out her favourite pictures by a motion of the large old-fashioned fan that dangled from her arm: she was in truth a chronicle of the past—had sat to Sir Joshua when quite a child—and been the companion of West, and Opie, and Northcote, and all the great men of ancient times; seen David Garrick; and been patted on the head by Dr Johnson; laughed at and with Oliver Goldsmith; and spoke of Queen Charlotte and George III. as a handsome young couple. She was both rich and benevolent, and, despite her age and the infirmity of deafness, she was the best physician that ever entered the close atmosphere of the pale student's chamber: the ease, and grace, and gentleness with which she developed truth, added to its beauty, but did not lessen its power. She was a sound critic—yet a kindly judge. Sir Thomas Lawrence used to say of her, that her very look at ninety was inspiration!

Her general sitting-room was in admirable keeping with its mistress; old chairs, old carvings, old china, old bits of tapestry—with here and there a drapery of golden yellow—a cushion or chair covered by rich deep-toned crimson velvet—and when the sun shone through a little painted window, illumining an angle of the apartment with its fine tints, it threw a sort of halo over these silent but sure indications of pure taste, and made the artist feel at once at home. Then the delight with which, when she found an attentive listener, she would draw forth from an old cabinet some cherished and exquisite miniature—the gem of her treasure-house—and have a little tale to tell of everything she possessed. Latterly she had, as I said, become deaf; but this did not diminish the cheerfulness of her well-toned mind: set her talking, and it was like a happy voice from the graves of those mighty ones who now live but in their works.

'You said, my dear madam, you would tell me the story of that picture yonder,' I observed one evening.

'Ah, yes!' she replied; 'that, my dear, was painted by a young man! Poor fellow, I shall never forget what old Northcote said to me about him; but that does not matter now. It was April—a few days before the pictures went in for exhibition to Somerset House, and I was sitting in this very chair, as I have done for the last five-and-forty years! About noon—when Nancy—(Ah, we have no such servants now-a-days!)—Nancy told me that an artist, she was sure from the country, wanted to show me a picture. I admitted him immediately. He placed his production in the best light, and apologising briefly for his intrusion, stood opposite to that very picture whose "story," as you call it, you wish to hear. Young men, my dear, in those days were more ambitious of painting than dressing, like Raffaele; they did not wear their hair over their shirt-collars—cultivate a mustache, and scent of cigars; and yet I never saw

any human being look more like a creature of glorious inventions than the poor pale boy—for he was little more—who painted "The Unjust Judge." His orb-like brow would have well become a crown of laurel; and though he was so singularly handsome, that for a few moments he was the picture upon which I looked, I felt sorry at heart for what was stamped upon his features.

'What?' I inquired.

'Death!' was the solemn reply. The old lady rose from her seat, and taking the arm of her beautiful relative, who resided with her, tottered opposite to the picture. 'Observe,' she continued, 'the hard stern countenance of the magisterial-looking man, who, seated at the head of the table, has decided that the widow—the young widow of an old and faithful tenant—has no further claim on the land, which she imagined secured to her by virtue of a letter, the fragments of which are upon the ground. Observe the look of purse-proud satisfaction the new tenant casts upon the friendless woman, whose faded mourning evinces that she has no means to apply to a higher court. Note how full is the leathern purse he has ostentatiously placed upon the table; do you not see the convulsed clutching of the widow's fingers, as she stretches forth her hands to implore mercy where she might demand justice? the veins of her small white throat are distended by suppressed emotion; her eyes are heavy with unshed tears; and observe also how indignant the boy looks; he has just ceased to grasp the crape shawl that has nearly fallen from his mother's shoulders; his little fists are clenched, as much as to say, "See how I will be revenged when I become a man!" The accessories also are well, yet not too strongly developed. The fat and insolent cat has driven the widow's timid little dog into a corner; his eyes in utter helplessness are raised to his mistress's face, whose agony is too great to heed the distress of her puny favourite! I do not often look upon it,' she added, returning to her seat, 'though it conveys a fine moral; yet whenever I do, I turn my eyes into my own breast, lest I also may have been an unjust judge!

The old lady paused, and her last observation found an echo in my heart. Great God! how true this is: how apt are we to sit in judgment on each other—how apt to pronounce sentence on a sister's frailty, on a brother's crime—without a knowledge of the temptations which led either to the one or the other; without even inquiring whether what we have heard be true or false! How outrageous we become if we are judged—how careless in judging!

'But the story!' I said at last. 'It is not ended?'

'Hardly commenced,' she replied, and then continued.

'I expressed my approbation in a few words, for the subject touched me. There were faults in the colouring; but the moral was so true that I saw at once the youth had the elements of high art within him. It is an admirable thing to do justice to nature, to copy faithfully the immortalities amid which we live; but it is still more glorious to embody the workings of the mind, to create, to lead as it were the inventive faculties of our fellow-creatures into a higher world. The avarice of the unjust judge is stamped upon that face for ever, and the supplication of the widow seems bursting from her lips. After looking at it for some little time, I inquired what value he put upon his production. He said "he had never thought of that, he only wished it to be exhibited."

"And why, then, did you bring it here?" His pale cheek flushed, while he replied "that he resided in Northumberland; was not acquainted with any one in London; and feared that if he sent in his picture it would not be exhibited, unless some one were good enough to speak for it; so that it might obtain a place—a place where it could be seen, particularly by one person."

'I told him I would purchase it. He thanked me; but that, he said, was not what he wanted. He wished

it to be seen at the Royal Academy. He had heard that I knew a great many of its members. Would I, if I liked the picture, say a kind word for it to those who had power? His only wish was to see it hung where one person would be sure to see it. The request was so strange, the picture and the youth both so interesting, that I desired much to unravel the mystery. I soon gained the young man's confidence, and his story was quickly told.

'His father had been one of those upright God-fearing tillers of the soil from whom our greatest men have sprung. His life was the last in the lease he held of his land, but he had received a letter from his landlord promising, in case of his death, a renewal of it on the old terms. His father died, and in less than a week after his father's death, the landlord died also. His mother had so firm a dependence upon the letter, that she never thought of the lease: indeed, as the young man said, she was too much absorbed in her own grief to think of worldly matters, until a notice to leave what had been so long her home was served upon her. It was in vain she endeavoured to see the landlord: he would not admit her: she wrote—no notice was taken of her application. "Beaten down," he said, "by circumstances, she would sit day after day looking at a small defaced water-colour drawing of my father, which had been done by some itinerant artist, and seemed her only consolation. I was too young to share her griefs, but not to observe them; and I remember the desire I felt to make a picture like the one she loved, that it might be caressed by her. One morning she had been weeping bitterly; and urged as it were by some sudden resolution, she took my hand, and we walked together in silence to the hall, regardless of the rebuffs of the servants. My usually gentle mother forced her way into the squire's library, and discovered, what I afterwards knew she expected from the information she had received, her landlord in the very act of signing the lease that was to deprive us for ever of the cherished dwelling of our ancestors. Roused by a sense of his injustice, she placed before him the letter from his father to mine; in an instant he tore it into atoms, and flung it on the floor. Stung still more deeply, she clasped her hands and uttered a prayer of few words, but deep import, that he might never die until he acknowledged his injustice. Had I known how to curse, I would—boy though I was—have cursed him from my soul; but my mother had taught me nought but blessings. We returned home: she knelt opposite to where my father's picture hung, as if it had been a shrine, and poured out her soul to God in prayers for patience. I stood by her side. "Kneel with me," she desired. I obeyed—but she observed the stubborn spirit that roused within me, and while tears streamed down her cheeks, she made me repeat words which for the first time found no echo in my heart. The softness of the child had altogether departed from me. I felt as if my spirit had sprung at once into manhood. We arose from our knees, I put my hand in hers, kissed her cheek, and said, "Mother, do not weep, I will protect you." I shall never forget the music of the sweet blessings she poured upon me then, while hot, hot tears coursed each other down her cheeks. From that time I saw her weep no more, though I knew she wept. For me, I grew hard and stern. I shunned my playmates during the few days we remained in our old dwelling; I could neither eat nor sleep; my soul swelled with indignation and revenge. We left our pleasant dwelling; the shadow of the trees fell no more upon our paths; the hum of my mother's bees, which had been as the music of the sunbeams, sounded no more in my ears; the willow, planted by my father on my birthday, which had grown to be a tree while I was yet a child, no longer waved above my head. We lodged in a small room of a small house in a neighbouring village; a small clean room, furnished out of what seemed our abundance; the window-sill crowded with plants such as my father loved—those perishable yet sweet records of affection. Our dog, our household friend, shared our exile; but even that I had little sympathy with; my mind was bent upon things above my reach, but not beyond my desires. My mother worked at her needle, and taught me all she knew, and every halfpenny I could procure, could earn—for I was no beggar—by little acts of usefulness, I laid out in purchasing paper and pencils. I did not know then what being an artist meant; but I knew that I should like to copy my father's picture, to draw the scenes of my early childhood, to depict the one particular scene that was burnt into my

heart, to grow by some means to be rich and powerful, that so I might be revenged on the unjust judge. This last resolve I dared not impart to my mother, from a consciousness that it was one she would disapprove the most. And yet that man bought pictures and hung them on his walls; and people enloured his liberality, and praised his taste; and that he had taste I cannot doubt, but he had no heart. Is it not strange," inquired the young painter, "that a man can tell what is excellent on canvas, and have no appreciation for what is excellent in life; can understand what is natural when delineated by the painter's art; be touched by painted tears, and yet be utterly incapable of feeling and combining the sensations which spring from nature? Is not this most strange and contradictory?"

'I told him he would not think so when he had seen more of the world, and understood how many contending currents meet and struggle within the heart of man. Perhaps you are already tired of the young artist's tale? I like, old as I am, to hear of struggles, of difficulties overcome, of mountains scaled by hardy enterprise, of seats upon their pinnacles; and I spoke words of hope to him, which fell like rain upon a fertile soil—for his mind was one large treasure-house of poetry. And then he related much of the past: of his own privations he evidently did not think; but his mother's sorrows, lessened as they must have been by cheerful industry, and lightened by the knowledge of his innate talent, dwelt upon his memory. Yet he confessed to moments of most keen enjoyment; the calmness of the Sabbath evening, when the music of the bell had ceased, and the voice of the preacher, or the melody of the choral hymn, chanted by infant voices, mingled with the perfumed air; when the worship was over, and playing with a pencil, which his mother kissed him "not to use on Sunday," she read within her little room the scenes from Holy Writ, which, praised be God, have taught many painters the road to immortality! And, when obliged to labour in the fields, his eye drank in the magic hues of cloud and rainbow, sunshine and shadow; in truth, he said, the more he saw of nature the weaker grew his purpose of revenge towards "the unjust judge." The beauties of the beautiful world softened his spirit; but when he looked upon his mother's hands, hardened by labour, or saw her feeble frame bending with more than woman's weakness, his purpose revived, the agonising scene stamped upon that canvas rose before him, and as he grew older, he determined, "an that he lived to be a man," to do what you see he did accomplish. Several years before (for an artist's talent is long budding before it blossoms), while his was yet in its infancy, the man who had acted so cruelly left his neighbourhood, and came to reside near London. He paid a visit to his property but once, and then offered his *patronage* to the boy artist he had so injured; by whom, I am proud to say, it was indignantly refused. The gentleman was bitterly hurt at this, for he would have greatly enjoyed the notoriety of "bringing out" such extraordinary talent. How different from the warm and noble zeal which makes and bears the torch to light the path of genius! But I grow prosy," said my old friend, "and will hasten onward: the desire of the young artist was, that his picture might be placed where it could be seen to advantage; he had grown out of the memory of his mother's persecutor, and had resolved to stand where he might watch by it, to see the effect it would produce—not upon the world, but upon him whose injustice he had depicted with so powerful a pencil. "If," he said, "I could but see him change colour; if I could perceive the least indication that he felt the reproof; that the circumstance was recalled; that the power he had crushed into the dust had risen, and stood before him to reprove his injustice; if I could only make him *feel*, I should be satisfied; it is now all the revenge I covet."

'But his mother?' I inquired.

'She still lives,' was the reply; and then my old friend informed me, that his (the artist's) resolution on this subject almost amounted to insanity; he fancied his picture would work a miracle; soften a hard heart; change the current of a man's blood; alter his nature. Like all those who live alone, and who judge of mankind from themselves, his information, his conception of human character, seemed as contracted as his imagination was vast and vivid; and, in addition to this, he was suffering from a constitutional sensitiveness, which made him far more susceptible than rational men are supposed to be.

'His picture went at the appointed time to the appointed place. I studiously kept the secret that the persecutor—the unjust judge—was intimately known to me; and feel-

ing as I did the utmost anxiety for the young painter, I made him consider my house his home. But his spirit had all the restlessness of genius. As a boy at school counts the days, the hours, that must elapse ere he returns to his home, so did this creature—compounded as he was from the finest essences of our nature—count the moments until the academy would open. It was almost frightful to witness his fits of anxiety as to where the picture would hang—if it would have a good place—if it (perchance) might be killed by some glaring sunset, or saffron sunrise—when the artist, “mad with glory,” deepens the hues wherein Almighty God thinks best to steep His landscapes. It was positively fearful, after such acute fits of care, to see the avidity with which he drank in the inspirations poured by the old divinities upon their canvas. It was wonderful to observe how his mind, taught by nature, distinguished at a single glance the gold from the tinsel; and how he spurned whatever was counterfeit or poor. He would, after such excitements, return to his calculations touching his own picture. Sometimes depressed at its inferiority when compared with what he had just seen; at other times full of hope, calculating on the probable result—repeating the difficulties he had encountered—recalling the tears which stood trembling in his mother's eyes when some simple villager would express such natural wonder as to “how he learned it all!” Then he would picture the rich tyrant acknowledging his injustice, and confessing shame; calculate as to the probability of his picture, the first-born of his brain, being extolled by the critics; portray his mother, her thin fingers trembling, and her emaciated form bent over the column where her son's name was marked with praise; hear her read his commendation, and then fall upon her knees in gratitude to God, remembering in the hour of triumph, as well as in the hour of sorrow, that it is He who gives or takes away as seemeth best. Then, poor fellow, in the fulness of his heart he would describe such pictures as he was to paint; he did not care for poverty—not he! he knew it well! he never could be as poor as he had been. He felt his power, like the infant Hercules strangling his foes without an effort—his fortune in his hand—his patent to immortality made out! He and his mother could live in a garret—ay, and die there! But he would make a name that would defy eternity—he would! Poor—poor fellow! repeated my old friend mournfully; “and yet there was nothing boastful in this; it was pure enthusiasm.”

“Those who had seen the picture here were delighted and astonished, and more than one assured me the placing would be cared for. I felt so convinced that the composition would stand upon its own merits, that I did not desire to lessen the dignity of my new favourite, by requesting as a favour what I felt he had reason to demand as a right. A foolish thought!” said the old lady, taking a fierce pinch of snuff—“a foolish thought for those who want to get on in the world, but a wise one for those who prefer the jewel of existence—self-respect—to aught else.”

“The first Sunday in May arrived, to be followed, of course, by the first Monday. He sat with me till late, not here, but at Richmond, where I reside occasionally. He was looking out over the river, floating in the glory of the setting sun, speculating as usual about his picture, and the chance that by that time next night it would have been seen, and its merit acknowledged by its unconscious author, to whom he wished to show the moral of a picture. He was literally wild with hope and excitement, speaking of his mother, wishing for her, and then saying what glory it would be to see some of those mighty masters of his art who had lived and moved among us. Like a young eagle, he panted for the rising sun, towards which he lunged to soar. Poor, poor fellow!”

There was a pause, and I longed to hear what was to follow, yet feared to inquire.

“The next morning,” she continued, “I ordered the carriage so early as to drive under the gateway at Somerset House about a minute before the hour at which the doors were to open. There was the usual crowd—the earnest, intense-looking students, some more pale than usual, others flushed by anxiety—mixed up with critics, and poets, and persons wishful to be the first to see the national exhibition, whose quantity, quality, and arrangement indicate the nature, and progress, and power of British art. But few of the academicians were there, though one or two were recognised; and notwithstanding the density of the crowd, room was made for them, and a murmur ran, “Do you see Stothard?” or, “There is Westall,” or, “That’s the young artist, Wilkie,” intimating the current of the

people's thoughts. My young friend recognised me, bowed, and then the doors were opened. I saw him rush forward with the rest; and, just as he was about to enter, he turned his face towards me: it was lit with a light which disappointment would quench in death. He waved his hat, and disappeared. I waited until the crush had entered, and proceeded to obtain a catalogue. It is marvellous how quickly a crowd disperses; all had passed up stairs. Suddenly my arm was pressed: I turned round; there stood the young painter, his face shorn of its beams, his whole aspect changed from that of a living man to an almost breathless corpse. He seemed rooted to the spot, while in a tone, the character of which I cannot describe, he muttered, “My name is not in the catalogue.” There were doubtless many others that day doomed to the same disappointment—many who, perhaps, deserved the annual oblivion which overwhelmed the industry and hopes of the past year; but, unhappily, there were also many others who were condemned to the same suffering, merely because there was not space in wealthy England to display the treasures of that genius which confers honour upon the land that calls forth its existence. Many worn and anxious faces—many whose hearts were crushed—passed beneath that portal; yet I heeded but the one. I knew the boy could not survive it long. He had never anticipated its rejection, nor indeed had I. I insinuated there might be some mistake; but, easily depressed as excited, he only clenched between his hands the doom-book of so many, and shook his head. I ordered the carriage to be recalled, and taking his arm, led him towards it. As we descended the steps, I felt him start and shudder. I looked up—the unjust judge stood before me! The coincidence was strange. On the instant I invited him to dine with me the next day in town; the invitation was accepted. My footman assisted the lad into the carriage as if he had been a child; he shrunk into the corner, his noble spirit totally prostrated by his disappointment, while he turned his face away to conceal the agony he had not deserved. I think, said the good old lady, “I suffered almost as much. After many efforts I succeeded in turning the current of his thoughts; I assured him the picture should be seen the next day, and that he should witness the effect it produced. I insisted on his remaining entirely at my house; but he had been lessened in his own esteem, and suddenly his manners had become lofty and severe. I let them remain so for a little; but, assured that nothing would so much relieve his overcharged heart as tears, when we were quite alone on the morning of the next day, I spoke to him of his mother, of the scenes of his youth, of her piety, her tenderness, her love; the boy conquered the Stoic—I left him weeping. I had undertaken a most painful task, but it was my duty to complete it.”

“As the dinner hour advanced, I placed the picture, which I had reclaimed, in the best possible light, but drew a curtain, so as to shade it from observation till the time of trial arrived; the artist was in the room, and at last my guest came. After a few minutes had elapsed I arose, as I do now, and stood here, the painter remaining in the embrasured window. Suddenly I displayed the picture, and asked him what he thought of the story? “Do you read the story clearly, sir,” I said; “perhaps, as it is mine, you will help me to a name for it? A widow, sir, a poor widow believed in her landlord's honour, and intrusted to him a promissory letter for the renewal of the lease which expired with the breath of her dead husband. You see her there; beauty and sorrow are mingled in her features. He has taken the letter; and behold you how men, ay, and rich men too, value their honour; its fragments are on the carpet—the weighty purse of the rich farmer has outweighed the woman's righteous cause. Can you name my picture, sir? Her child, her boy feels though he does not understand the scene; he has dropped his mother's shawl; his hands are clenched; if God spares him to be a man, he will devise some great revenge for that injustice.” I thought the gentleman turned pale, and I knew that my young friend was crouching in his lair. “Look you, sir,” I continued, “out of the pictured window: is not the landscape pleasant? the tree is remarkable; a famous tree in Northumberland; the—something elm. And within, as you observed, the accessories are well made out: the fierce cat pouncing on the little dog; the elk's horns stand out from the panelling; and the emblazoning of the shield and arms upon the wall—the arms are distinct—”

“Madam!” he exclaimed, in a voice hardly audible from agitation, and then paused.

"The scene took place," I continued, without heeding the interruption, "some ten or twelve years past. Is it not so, Edward Gresham?" I added, appealing to the youth.

He came forward, pale, but erect in the consciousness of his own rectitude, and satisfied that the great object of his existence was attained.

Although I was much agitated, I saw the eagle eye of the artist look down the hurried glance which the unjust judge cast towards him, and I almost pitied him, humbled as he was by the conscious shame that overwhelmed him. He was stricken suddenly by a poisoned arrow; the transcript of the unhappy story was so faithful, the presence of the youth so completely fastened the whole upon him, that there was no mode of escape; and his nature was too stolid, whatever his disposition might be, to have any of the subtle movement of the serpent about him.

"And you," he said, turning away while he spoke; "you, whom I have known for twenty years, have subjected me to this!"

"Do you acknowledge its truth, its justice?" demanded the young painter; "do you acknowledge the fidelity of my pencil? I have toiled, laboured, suffered, to show you your injustice in its true colours: but I see you, the proud landlord, turn from the orphan-boy whom, in open defiance of every righteous feeling, you sent houseless, homeless, fatherless, friendless, upon the world. I see you cannot meet my eye for shame. Ay, ay, proud gentleman, that will live when you, ay, and I too, are in our narrow graves!"

"I offered you reparation," said the landlord, overpowered by the energy of the painter and the truth of his picture; "I offered you reparation."

"You offered me patronage!" retorted the indignant boy; "insult with injury."

The landlord turned to me; he was greatly agitated. "Has the patronage I have extended to many, madam, even within your knowledge, been injury?" he inquired.

I could not but acknowledge that he had purchased many pictures; and replied his collection would prove that he highly appreciated art.

"I will," he added, "even now give him any sum he chooses to name for that picture."

"It is sold," replied the artist.

The old gentleman's countenance changed; he walked up and down the room; once or twice he paused and looked at the sad history, which he would then have given much to obliterate.

"I confess," he said, "the faithfulness of the portraiture; but there were palliating circumstances. Still, I confess I acted wrong—I confess it! I will make retribution; we cannot tell what our acts may produce."

"Injustice," said the youth calmly, "is the parent of misery to the injured and the injurer; it was a cruel act, setting aside its treachery; it was a cruel act, God can judge between thee and me! My mother, a delicate fragile woman, myself almost an infant; and your father's promise, sir, your own father's promise that you scorned; oh sir, how could you sleep with the consciousness of such injustice haunting your pillow?"

"You have your revenge, young man, your revenge," murmured the gentleman; "I acknowledge my injustice; I will make reparation."

"You cannot cancel the past, my mother's years of suffering, my own of labour; but enough. I see you feel I have conquered; my feeble hand has sent conviction to your heart; and I—!" He staggered to a chair, and became more pale than usual. I thought he was dying, but it was not so; the heart does not often give way in the moment of triumph—for it was a triumph. I must do the landlord justice: he repeated his regret, he even entered into the young man's feelings, and commended his art; he did all this, and the next morning remitted me a large sum "as a debt due by him to those he had injured."

"How apt are the rich to think that money can heal all wounds. My poor young friend only survived sufficiently long to see his mother, though but for half an hour. It was almost in vain that, kneeling by his bedside, she implored him to think of the world to come. He believed he was too young to die.

"I triumphed, mother, I triumphed," he repeated, his eyes glittering with unnatural brightness; "I triumphed; I made his heart quail and his cheek blanch, and he begged my forgiveness; but it was altogether too much for me; first the disappointment, and then the triumph; it fermented my brain, though I found another mother who taught me that the just and the unjust are mingled

together; but now that turnpail is past, you are with me—really, really with me. I will sleep on your bosom, my own mother, as I used when a little child, and to-morrow I will tell you all I mean to do."

"Then all is peace," she murmured.

"Ay, mother, all is triumph, and peace, and love," he replied. "I wonder how I could have hated him so long." He laid his head down with the tranquillity of a sleepy infant, and it was in vain she tried to repress the tears that fell upon the rich luxuriance of his hair—he felt them not.

"He has slept more than an hour," she whispered me. I saw he would never waken. I could not tell her so, but she read it in my face. It was indeed a coorse she strained in her arms, and long, long was it ere she was comforted. I never saw my old acquaintance afterwards; but he requested, as I would not yield him up the picture, that I would never suffer it to pass from my possession, or mention his name in connexion with it. He died many years ago, and proved his repentance by providing, in a worldly point of view, for her who had been so long the victim of his injustice.*

VEHICULAR STATISTICS OF LONDON.

NO IL—HACKNEY-COACHES AND CABS.

PEOPLE are often surprised at the narrowness of some of the thoroughfares in the older parts of London, so inadequate for the press of vehicles now crowding them, without knowing that they were formed before coaches came into general use. Up to the seventeenth century, street accommodation was only required for pedestrians and horsemen. Even carts were little used, the pack-saddle being generally preferred for the transit of goods and merchandize. The chief highway of the city previous to the reign of Elizabeth was the Thames, and boats were the principal vehicles. Upon its banks the most important buildings, whether of a public or private nature, were constructed, on account of the easy access to them which the river afforded. Each had its 'water-gate,' its collection of wherries and barges, with a sufficient number of watermen and rowers, for the same purpose as a modern great man keeps horses, carriages, and grooms. Theatres and other places of amusement were for the same reason built near the stream; chiefly on its southern bank. The Watermen's Company was then a rich and powerful city guild; but when carriages were introduced into England, its profits and influence were greatly diminished, and one of the body, John Taylor, commonly called the 'water-poet,' bewailed the decline of his calling in a pamphlet entitled 'The World Runs on Wheels.' He did not inveigh against coaches belonging to persons of quality, 'but only against the caterpillar swarm of hirelings. They have undone my poor trade whereof I am a member.' He maintains that the hired carriages 'have so overrun the land, that we can get no living upon the water; for I dare truly affirm, that every day in any term, especially if the court be at Whitehall, they do rob us of our livings, and carry five hundred and sixty fares daily from us.' This exact numeration of the number of passengers is probably founded on a good knowledge of the number of vehicles then let out.

The history of London hackney-carriages may be said to commence in 1634. 'Gossip' Gerard, then writing to Lord Strafford, says, 'I cannot omit to mention any new thing that comes up amongst us, though never so trivial: here is one Captain Baily, he hath been a sea-captain, but now lives on the land, about this city, where he tries experiments. He hath erected,

* Reprinted, with the concurrence of the author, from the Art-Union, May 1844.

according to his ability, some four hackney-coaches, put his men in livery, and appointed them to stand at the May-pole in the Strand, giving them instructions at what rates to carry men into several parts of the town, where all day they may be had. Other hackney-men seeing this way, they flocked to the same place, and perform their journeys at the same rate; so that sometimes there are twenty of them together, which disperse up and down, that they and others are to be had everywhere, as watermen are to be had by the water-side. Everybody is much pleased with it.' This sort of rivalry amongst the hackney-men of the seventeenth century was productive of similar inconvenience to that arising from the recent introduction of omnibuses, as mentioned in our former article, and in 1635 a proclamation was issued 'to prohibit all hackney-coaches to pass up and down in London streets.' Fifteen years later, another proclamation forbade hackney-coaches to course 'into the streets or to stand to be hired.' In spite of this regal mandate, Pepys records in his Diary of 1660, 'that he got a coach to carry him home on the very day the proclamation was to take effect.' The vehicle of that day was very narrow, and the driver rode on one of the horses as a postilion. As the streets widened after the great fire of London, so the dimensions of coaches were increased, and the coachman sat on a box. 'This was a thing for use,' says Mr Knight in his London, 'not for finery. Here, or in a leather pouch appended to it, the careful man carried a hammer, pincers, nails, ropes, and other appliances in case of need; and the hammer-cloth was devised to conceal these necessary but unsightly remedies for broken wheels and shivered panels.' The proclamation of 1660 had been found so unworkable, that, in the very next year, we find hackney-coaches, to the number of 400, allowed by law to ply in the vicinity of London, the proprietors being obliged to pay to government L.5 a-year, as a license for each vehicle. It is curious to see how the use of these conveyances increased in near proportion to the gradual increase of the London population. In the year 1694, the number of licenses was extended to 700 coaches. Twenty years later, a hundred more were added; and in the year 1768, 1000 hackney-carriages were allowed to stand for hire in the streets of London, 175 of which only were suffered to ply on Sundays. By a later act (8th George III, cap. 24), a commission was formed to manage metropolitan hackney-coaches, and to receive the duties. They also appointed coach-stands, and men to water the horses at each of them. Some of the regulations imposed on the drivers evince the aristocratic prejudices of our ancestors: one clause in the act makes a hackney-coachman liable to a penalty of L.5 for 'not giving way to persons of quality and gentlemen's coaches.'

The limitation of the number of hackney-coaches made that branch of trade a monopoly in the hands of the proprietors of the vehicles, and although the law restrained their charges to fixed rates, yet it could not prevent the incivility of the persons they employed. Secure from competition, they seemed to treat their customers as if they did them a favour by driving them.

Hackney-carriages of the old school, which kept a monopolising existence up to the year 1823, were divided into two classes—the coach, and the 'charrot' or chariot. The former was a lumbering second-hand article, in some cases half a century old, most of its services having been previously given to some no-

bleman's or gentleman's family. Discarded by its first master as unfit for further use, it was bought by the proprietor of a 'plate,' that is, the piece of painted tin on which was embossed the number of his hackney license. The vehicle was restrained by law to hold no more than four persons; but on a dark night, when informers might find it difficult to ply their calling successfully, it was sometimes made to hold six persons, or even a seventh on the box. The 'charrot' had no double seat, consequently it was only calculated for two sitters. Though both sorts of vehicles were drawn by two horses, vehicular motion of every sort was, while they were in fashion, much slower than at present. A hackney-coach stand presented a picture of perfect repose. The horses stood motionless, and were either fast asleep, like their master on the box, or stood quietly munching chopped hay out of nose-bags suspended from their heads. The coachman sat under the weight of a heavily-caped 'box'-coat, either in a state of profound reflection or of nodding somnolency. When, therefore, any one wanted his services, it was necessary to bawl with might and main; but as that very often proved ineffectual, the attendant 'waterman' of the stand was often obliged to use active measures to wake him. Having recovered from his reverie, or his nap, the driver slowly rolled himself off his seat, and, assisted by the waterman, removed the nose-bags, or awoke the horses, and dragged them by the head-gear to the side of the pavement; the door-steps were then leisurely unfolded, and the 'fare' or passenger, helped in. If the animals were thought to want water, a few minutes were occupied in giving it to them, and after the coachman had handed the waterman his 'rent'—a perquisite of one halfpenny, receivable every time a coach left the stand—the wheels were made to revolve at the rate of about three miles an hour. So notoriously slow were the motions of these vehicles, that when a coachman of extraordinary activity carried his enterprise so far as to solicit custom by saying to a passer-by, 'Coach, sir?' the reply frequently was, 'No, thank you—I am in a hurry.'

It is not a little singular that the London public suffered from the surliness and inactivity of the hackney-coach fraternity, well knowing that for years a light and commodious sort of vehicle had plied in the streets of Paris, to the great accommodation of its inhabitants. These were called *cabriolets de place*, of which so long ago as 1813 no fewer than 1150 existed. Efforts were, it is true, made by one or two private individuals to introduce them into London; but without effect. Their scheme was stopped at the outset, for they could not get licenses. With that reverence for 'vested rights' which is so characteristic of official operations in England, the hackney-coach commissioners thought it would be unjust that each London proprietor—who had bought his licenses with the express understanding that he should only have a certain number of rivals—should suffer by the introduction of others. At last, in the year 1823, two resolute individuals, Messrs Bradshaw and Rotch, the latter a member of parliament, caused, we believe, eight cabriolets to be built; and after some hard fighting with the commissioners in Essex Street, they procured licenses. From that day the sun of hackney-coach prosperity declined. The new vehicles were exactly suited to persons for whom the old coaches were quite unavailable—namely, those who happened to be in a hurry. They were hooded chaises, drawn by one sound, fast-trotting horse, and driven by an active man in livery, who sat beside his passenger, there being no room for a separate driving-box. They were capable of holding only one person, but him they carried at fares one-third lower than those of the original vehicles.

The old Jehus presented a slow, heavy, ill-arranged

opposition to these cabriolets; they bribed the 'watermen' not to let them have good places on the stands; and when one of them was accosted by a customer, the whole rank or row of coaches moved off the stand to entice away the 'fare'; but the 'cab' always got to the passenger first, with whom it was driven off before the hinder-wheels of some of its rivals had begun to move. The number of cabs increased, much to the detriment of the coach-proprietors' 'vested rights,' and they appealed to the commissioners, who kindly augmented the number of hackney-coach licenses to 1200, restricting those of cabs to sixty-five, and thus stood the statistics of the London hackney-trade up to the year 1832.

Meanwhile, it was found that the one-horse vehicles were capable of affording a much greater amount of accommodation than their then construction furnished, and variously-shaped carriages were invented to hold more than one person. The first improvement consisted of making a driving-seat over the right wheel, so as to leave room under the hood for two passengers; then came box-cabs, back-door cabs, four-wheel cabs, and, last of all, 'Broughams' and Hansom's patent cabs, which seem to have taken a stand as the favourites with their proprietors and the public. In 1832, every restriction as to the number of hackney-carriages being removed by a new act of parliament,* one-horse vehicles of all the shapes and descriptions we have enumerated above, besides a great many more, suddenly made their appearance in the streets of London; and most of the old drivers, with their lumbering coaches and superannuated horses, were gradually starved off the stands. What has become of them no one can tell; they were too bigoted and inactive to become cabmen; and those who were not prudent enough to save up a 'bit of money' during their days of prosperity, most likely ended them in the workhouses of their respective parishes. Their downfall was but little regretted. But they have not been wholly banished from the streets: 'not quite two hundred'—according to the information we received from the registrar of licenses—still creep about London, and earn a scanty livelihood for themselves and broken-down cattle; while, during the year which ended on the 4th of last January, there were cabs daily driving about London, in flourishing prosperity, to the number of 2400.

In viewing the moral statistics of the London hackney-coach trade, it is much to be feared that, in the aggregate, the character of the drivers was not improved by the change. The old 'Jarvies,' as they were called by their familiars, were, it is true, a tiresome, surly race; but they possessed a slow-going, rugged respectability, which cannot be overlooked when a comparison is made between them and their successors. Firstly, they never raced in the streets; and although this merit is much diminished when we remember the age of their horses and the weight of their vehicles—yet elderly people, who now walk about London at the imminent risk of being knocked down by some recklessly-driven cab, cannot but look back upon the hackney-coach times with regret. Again, we are led to believe that they were more honest; and this is partly proved by some facts which we have learnt concerning the restoration of lost property by that fraternity. It frequently happens that passengers leave articles in the vehicles they have hired, and the restoration of such waifs and strays entirely depends upon the honesty of the coachman. Since 1822, a rule has existed by which, when anything is found in a coach, the driver is bound to deposit it with the registrar of licenses, that the losers may know where to apply for it. It is then restored, upon payment of a small fee for the driver's time and trouble in bringing it. During four years and a half after this regulation was made, property was brought into the office of the estimated value of £45,000, and not many applications for lost articles were made over and above the number of articles restored. All, or nearly all this honesty, must

be put down to the credit of the old coachmen, for cabs had but just been introduced. On the other hand, the account received from the present officials of the hackney-carriage registry wears a very different complexion. We were told that, although upon an average from fifteen to sixteen hundred 'strays' were deposited in the office during the past year, they were all of small value; that applications for at least fourteen times the number were made; and that a number of things at least ten times greater are actually lost in cabs than are brought to the office to be restored.

The pecuniary relations of cabmen and their masters are fortunately singular in this country. It appears that the masters have no chance of being honestly dealt with, if they were to pay wages to their servants. They therefore lend out the vehicles and horses at a fixed sum per day; or rather the men are expected to bring home the stipulated amount. Sometimes, in the dull season, they beg off for less, but it was remarked to us by the manager of the largest establishment of cabs in London, that, let the town be ever so full, or the season ever so prosperous, they never produce more than the fixed amount, so as to make up for former deficiencies. One master tried the experiment of trusting to his men's honour, and paying them in wages of a guinea per week each. During the second week circumstances came to his knowledge which induced him to reduce the stipend to ten shillings. The week after, he found he could not carry on his business profitably and pay his men more than five shillings per week. On the fourth week he paid them—like other cab-masters—nothing; for by this time experience taught him that they abstracted his profits, and pocketed the wages besides. Still, with the arrangement universally adopted, the masters seem generally satisfied.

Though gradually improving, the character of the modern hackney-carriage driver does not yet stand high. It must be owned that, before being restrained by the registration act alluded to in our previous article, the cabman was a far from pleasant person to deal with. His faults were the very reverse of those of the more patriarchal coachmen; they were active vices, such as furious driving, overcharging, and volubility in abuse, should a dispute arise. The personal licensing and badge system has had a most beneficial effect not only upon omnibus drivers and conductors, but upon hackney-carriage drivers. They have become of late infinitely more civil in their demeanour and moderate in their demands than they were before the act came into operation.

A recent official report declares, that during the past two years a decided moral reformation has taken place amongst them. Many of the cabmen are known to be regular visitors to a place of worship on Sundays, while others attend a school opened for their especial advantage. Some have given up driving cabs on Sundays, the better to observe the Sabbath. What we learnt at the registrar's office, tells very much in favour of the whole body:—In 1844, out of the 8492 drivers, conductors, &c. who applied for a renewal of their licenses, only 42 lost them from bad conduct.

The average produce of each hackney-carriage to the proprietor may be about ten shillings and sixpence a-day, to which, if about three-and-sixpence be added for cash appropriated by the drivers in lieu of wages, the amount per diem is raised to fourteen shillings. Hence we may conclude that there is spent daily by the London public for coach and cab hire £1715, and yearly almost £800,000. The cash annually circulated by all the metropolitan hired carriages, including omnibuses, exceeds therefore one million five hundred thousand pounds!

We may conclude by a recapitulation. During the year ending in May 1844, there were licensed 1854 conductors, 1740 drivers of stage-coaches, besides 4627 drivers of hackney-carriages, and 371 'watermen,' or attendants of 130 coach-stands; in all 8592 individuals.

* 1st William IV., cap. 22.

In the year ending 4th of January 1845, there plied in the streets of London 1472 stage-carriages—50 only of which travelled beyond the jurisdiction of the metropolitan police—and 2450 hackney-carriages, all of which were cabs, except not quite 200: in all 3922 vehicles.

THE GRAVE OF GRAY THE POET.

I HAD spent a day lately, by way of ovation in honour of the arrival of spring, in renewing my acquaintance with the beauties of Windsor and Eton, when I found on my return to Slough that I was just too late for the railway train. There was another train, however, at eight o'clock in the evening, and I set myself to while away the intermediate time by sauntering up and down, and pondering on the objects which had previously engaged my attention. I recalled the princely towers of Windsor, the parks, and the Long Walk with its three miles of elms. I thought of Falstaff and Herne the hunter, of the terrace and the gardens, and of the Yandyke room in the palace, where the long, oval, melancholy countenance of Charles I. is repeated by the exquisite limner till the features seem to be graven on the memory. There was also the neat little village of Datchet, with its meadows fresh and green in the spring sunshine, the cottages nestling under the protection of royalty, the Thames winding slowly in the midst, and tall Lombardy poplars shooting up here and there like spires among the massy woods and rich verdure. Certes, the land is goodly and fertile—excessive and dazzling in its exuberance—the perfection of cultivated beauty—the Eden of England. To a northern eye, it is almost

— too good
For human nature's daily food.

There is a want of rough and barren contrasts. A gray crag or a towering hill would be an advantage; but the natives, who love comfort and elegance, find change enough in the alternations of the seasons and the weather. Every month has its peculiar charms, and autumn must streak gloriously that wide expanse of foliage.

Brilliant as was the retrospect of this natural panorama, elevated and idealised by the imagination—aided, too, by the moral effects of ancient Eton and its groups of schoolboys—I felt somewhat baffled and dispirited at losing my conveyance, and having to wait some hours in forced and solitary contemplation. In this dilemma, I entered into conversation with one of the men engaged about the station. These liveried functionaries are generally civil and fair-spoken; for railways are certainly one of the few public things that are well managed in this busy money-hunting country. The man was intelligent, and he suggested that I had plenty of time to walk as far as Stoke Poges, and see the monument of 'the celebrated Mr Gray the poet.' Stoke Poges! Name unpoetical, yet welcome—I had entirely forgot it. There the pensive fine-spirited lyrical poet used to sojourn with his mother, 'Dorothy Gray, widow,' and his old aunts. There he wrote his humorous 'Long Story,' after visiting the antique mansion-house where 'my grave Lord Keeper,' Sir Christopher Hatton, once 'led the brawls,' and Sir Edward Coke studied law—there (at the said village of Stoke) Gray used to read Greek and study botany, noting down in his calendar the precise time when strawberries ripened, or the nightingale was first heard—there he completed his churchyard elegy, laid his mother's head in the grave—and there at length

he himself, the last survivor of his race, was also buried 'in the sure and certain hope of a joyful resurrection.'

In another minute I had crossed the road, and was on my way to Stoke, a footpath by the side of the dusty highway, with relays of song-thrushes and blackbirds singing cheerily overhead. The small square fields, bounded by hedgerows, and with pollard elms at the sides, are peculiarly characteristic of the English rural landscape. Scottish fields are more extensive, and the farms generally present more ploughed land, besides being enclosed by hard dry stone fences, without the convenience of footpath, stile, or crossing. These common rights are jealously guarded in England. No 'little tyrant of the fields' dare shut out the people from their immemorial prescriptive pathways.

I thought, as I went along, of the sad, chequered destiny of poets, and of the hallowed ground in which they rest after 'life's fitful fever.' Chaucer and Spenser 'sleep well' in Westminster Abbey. They were the first to give the 'eternal blazon' of poetry to the ancient consecrated walls, and their names and memory stand out prominently amidst the mass of later occupants. Dryden lies next to Chaucer, and next to him is Cowley—the 'melancholy Cowley,' as he loved to call himself. Near Dryden is Francis Beaumont—

Fletcher's associate, Jonson's friend beloved—

and Jonson himself, 'rare Ben,' sleeps in the silence of the north aisle. Michael Drayton, too, is in the abbey—the witty Prior, and the easy Gay—the reserved, yet gentle and cultured Addison—the rugged, warm-hearted Johnson, and, in the same grave, our own Thomas Campbell. Truly the south transept of that old minster is indeed the Poets' Corner. The name is immortal above all naming of priest, vergier, or architect! Yet, high and solemn as is the repose of the abbey, enshrining some of England's most precious dust, it does seem as if, after Chaucer and Spenser—the 'gray fathers' of the temple—our poets would sleep more appropriately apart, each in his chosen ground, amidst the scenes and objects connected with his history and genius. The individuality of the bard is thus more strictly and lovingly preserved. Shakespeare's tomb in the chancel of his native church, is holier ground than if his ashes were mixed with those of even the loftiest masters of the lyre. He has the whole of that fine conventual church, the murmurs of the Avon, and the waving of its trees, for his monument and requiem—a requiem everlasting and unbroken. Milton was ever in the heart of busy London, and his grave is there, half-desecrated and hidden; but that close, low-roofed church, round which is heard the constant stir of human life, appears no unmeet sanctuary for him who with heavenly aims and inspiration, yet 'the lowliest duties on himself did lay,' and was emphatically a worker with his fellow-men 'in populous city pent.' Let the voice of praise, the anthem clear, arise in the old dim edifice, and his majestic spirit seems present with us! Pope, in the little church of Twickenham, on the margin of the Thames—brimfull, and washing the grassy borders of his ruined villa—engrosses all the interest of the spot, and is inseparably, in death as in life, identified with the scene. Thomson's grave consecrates the shades of Richmond, where he dwelt—Byron sleeps near Newstead Abbey—and Coleridge and Southey within the shadow of their 'ancient walks and daily neighbourhood.' Scott has a noble grave in Dryburgh Abbey—a Gothic temple for his sepulchre. And here, in this quiet sequestered country churchyard of Stoke—in the open air—is the grave of the recluse and contemplative Gray.

There never was a more appropriate grave for a poet than Gray's at Stoke. The spot is so completely secluded, and so still—the church old, and covered with ivy—two huge, solemn-looking yew trees in the centre of the little churchyard—two thorn trees, now in blossom—and no gaudy tombs or decorations to intrude poor human vanity amidst the thoughts of death and

immortality.* We enter from the public road into a field or common, with footpaths striking across to the village; and in one corner, a few hundred yards off, separated in front by a wire-fence, on the sides by dark clumps of pine trees, are the church and churchyard. More distant to the left is Stoke Park, the magnificent residence of Mr Penn, a descendant of the founder of Pennsylvania, and which stands on the site of the manor-house that furnished the subject for the opening of the Long Story. The lawn and park stretch out till they meet and mingle with the church common, and are tenanted by a goodly herd of fallow-deer. To the south, over a large artificial sheet of water, is seen Windsor Castle, beyond which Cooper's Hill and the Forest Woods close the view. A high fluted column, surmounted by a colossal statue, commemorates the fame of the former distinguished possessor of the grounds, the great constitutional lawyer, Sir Edward Coke. But before approaching the church or mansion-house, we come upon a monument (railed in, and enclosing flowers and aromatic shrubs), being a large sarcophagus, supported on a square pedestal, with inscriptions on marble on each side. One of these tells us that the monument was erected A.D. 1799, in honour of Thomas Gray, 'among the scenery celebrated by that great lyrical and elegiac poet.' Time and the weather have effaced the remainder of this inscription, but on the other panels are verses from the Elegy, and the following lines from the Ode on Eton College:—

Ye distant spires, ye antique towers,
That crown the watery glade.
Ah, happy hills! ah, pleasing shade!
Ah, scenes beloved in vain!
Where once my careless childhood strayed,
A stranger yet to pain;
I feel the gales that from ye blow
A momentary bliss bestow!

And this calm, reflective 'bliss' seems to enter the soul of the spectator as he paces these interesting grounds. The grave of Gray is immediately in front of the chancel window. It is a plain tomb, erected by the poet to his aunt and mother, the sides built up with red bricks, and on the top a blue slab, bearing this inscription:—

'In the vault beneath are deposited, in hope of a joyful resurrection, the remains of Mary Antrabus. She died unmarried November 5, 1749, aged 66.

'In the same pious confidence, beside her friend and sister, here sleep the remains of Dorothy Gray, widow, the careful, tender mother of many children, one of whom alone had the misfortune to survive her. She died March 11, 1753, aged 67.'

There is no mention of the poet on the stone; but a former vicar of the parish (whose tomb, exactly similar, is close to the other) inserted a tablet with the subjoined inscription at the foot of the chancel window:—

'Opposite to this stone, in the same tomb upon which he has so feelingly recorded his grief at the loss of a beloved parent, are deposited the remains of Thomas Gray, the author of the "Elegy written in a Country Churchyard," &c. He was buried August 6, 1771.'

* Under one of the yew trees is a dark square tomb to the memory of a lady, *Jemima*, the wife of Captain Harrington of Seaforth, Cape of Good Hope, the daughter of Major Douglas of Windsor, and niece of the late Earl of Seaforth. She died in London in 1830, and was interred, as the tomb states, 'by her own particular desire, in this retired spot.' On the grave of a soldier, Captain Thomas Hay, formerly of Slough, is the following somewhat doubtful eulogy:—

'The aged soldier is in peace and joy;
And heavenly notes of praise, without alloy,
Fall soft upon his ear.
Where creeps the deathless ivy o'er his head,
He soft reclines upon his mossy bed,
A stranger now to fear.'

In the English country churchyards, we find few tomb-stones a century old, and indeed few at all. The graves, however, are decently bound with brair, and kept free from weeds.

Honour to Mr Granville Penn for his monument, and no less to the vicar for his lowly tablet! They merit the thanks of all pilgrims to the shrine of virtue and genius. The vicar died in 1780, and most probably read the funeral service over the remains of the poet, when they were laid in the same grave with his tender parent, whose name he never mentioned without a sigh.

Gray's affection for his mother seems to have been as strong and lasting as the filial piety of Pope, which forms so fine a trait in his character. Philip Gray, the father, was harsh and inhuman, and contributed nothing to the maintenance of his family. His wife was partner with her sister in a millinery business, from the profits of which she maintained herself and children, providing everything for her distinguished son whilst he was at Eton school, and afterwards at the university of Cambridge. Gray, we are told, owed his life to a memorable instance of the love and courage of his mother, who removed a paroxysm with which he was attacked in his infancy, by opening a vein with her own hand. Her attention was unflinching—her sacrifices great, though silent. And she lived to see her son a finished scholar and gentleman, and author of the *Elegy in a Country Churchyard*. The last was surely an over-payment of delight.

The people of Stoke claim the *Elegy*, as pertaining to their churchyard, while others assign it to the village of Granchester, near Cambridge. The latter seems to have the preferable right. Gray commenced the poem at Cambridge: his evening walk was often extended to Granchester, two miles from his Alma Mater, and the great bell of St Mary's would have formed the curfew of his imagination. There are no 'rugged elms' in the churchyard of Stoke, and scarcely a stone with 'uncouth rhymes and shapeless sculpture decked' of the requisite age. At Stoke, however, the poem was finished, and received the last corrections of the author. Writing to Walpole, June 10, 1750, he says, 'I have been here at Stoke a few days (where I shall continue good part of the summer), and having put an end to a thing whose beginning you have seen long ago, I immediately send it to you.' Walpole handed about the manuscript with great applause among the higher circles of society: it was printed by Dodsley, and soon circulated with a rapidity that astonished the timid and sensitive poet. But perhaps the most striking and interesting proof of the popularity of the poem is afforded by a touching and beautiful incident related in Playfair's life of Professor Robison. Robison, when employed as an engineer in the army under General Wolfe, happened to be on duty in the boat in which the general went to visit some of his posts the night before the battle which was expected to be decisive of the fate of the campaign. The evening was fine, and the scene, considering the work they were engaged in, and the morning to which they were looking forward, sufficiently impressive. As they rowed along, the general with much feeling repeated nearly the whole of Gray's *Elegy* to an officer who sat with him at the stern of the boat, adding, as he concluded, that 'he would prefer being the author of that poem to the glory of beating the French to-morrow.' We hope Gray heard of this incident. It would spread a momentary sunshine over his cloistered cell, superior even to the visions of his classic imagination.

I left Stoke just at the 'parting hour of day,' when the scene in some degree realised the rural imagery of the *Elegy*, so true to English country life. No one had been near while I pored over the tombs—there was no portress at the gate, 'to show the place' and solicit a gratuity; I could see in the distance the 'lowing herd,' and the ploughman plodding homewards. There was a 'solemn stillness' in the air, except where the rooks cawed among the high trees at Stoke Park, or lighted on the old square tower and wooden spire of the church. The yew trees looked more dark and gloomy; but there was a mellow light and delicious coolness on the green open common. The deer were as tame and quiet as the

inanimate objects around; and the whole seemed a picture of still life, over which poetry and religion had shed their softest and selectest influence.

SHORT HOURS.

For some time past the subject of early shop-shutting, and the general diminution of the hours of labour, have much engaged the attention of the well-meaning and intelligent, and the arguments in favour of such a system are alike urgent and obvious. Without at all entering upon the general merits of the question, we think there is one argument which, if not overlooked, has at least not met with that consideration which its importance deserves. It is all very well to talk of humanity and leisure for moral and intellectual improvement to men prepared to feel the force of such positions; but we need scarcely remark that views of this kind are either simply unknown to many masters, or regarded by them, from whatever cause, as visionary and extravagant. It is for this reason that we now propose to argue for short hours upon a purely economical ground. We design to show that any extension of work beyond a man's ordinary physical powers is attended with loss to his employer, and that any reduction within proper limits is followed by a corresponding gain. We mean, in other words, to establish, from facts before us, that men worked considerably within the limits of their power perform a greater amount of labour, and execute it more satisfactorily; that they are more intelligent, more apt to comprehend, more active, and more inclined to be obliging, than those who are worn-out and fagged by long and incessant toil.

It is evident, if a man be overworked to-day, that tomorrow he will be less able for his average labour; and that if a system of overworking be persisted in, the period will be hastened when he shall be totally unfitted for that species of labour, or be laid aside by disease. The same reasoning holds true in reference to time. If ten hours a-day be the average at which a man can work cheerfully and well, then twelve hours will render him dull and fatigued; and though he may continue at the work, he will not do one whit more, or, if he should do so one day, it will be at the expense of the labour of the next. This is viewing man as a mere animated machine, whose thews and sinews are capable of exerting a limited amount of force, and to which we can apply the mechanical axiom, 'that greater power cannot be gained but at the expense of time, and time cannot be saved but at the expense of power.' But this reasoning will not altogether apply to an intelligent being; and, in estimating the amount and duration of human force, we must take into account the inseparable attribute of mind. There is scarcely any species of labour—certainly none of the mechanical or mercantile—but requires care, vigilance, ingenuity, reasoning; and these are qualities so intimately depending upon a sound and vigorous bodily system, that it were folly to look for them from an overtaken and worn-out man. Reasoning in the abstract, then, we think it very palpable that any master must be a gainer, both in the amount of labour and manner of execution, by exacting from the workmen he employs rather under than above the average time during which their attention and activity can be maintained. Among the many practical illustrations of this doctrine, few could be more directly applicable than the following, which recently came under our notice. In Fifeshire, where the hours of the ploughmen are of average duration—namely, during daylight in winter, and from five to six, with a breakfast and mid-day interval, at other seasons—the men, as a class, are active, energetic, and well-skilled in their various duties. In activity we will back them against any similar class in the island, and the trial of skill which a few years ago came off between twenty of them and a like number from the Lothians (a pre-eminent agricultural district), places them foremost on the list at least as ploughmen. In Strathearn and the Carse of Gowrie,

on the other hand, where the hours of labour are notoriously long, the farm-labourer seems to be quite the antithesis of his brother in Fife. A farmer in the latter county, a few years ago, engaged two of the first-rate Carse hands at the highest wages, and placed them at the general labour of the farm along with seven native ploughmen. In a few weeks the difference between the imports and the natives became painfully apparent; for, with every disposition to oblige, they neither performed so much labour, nor executed it so well, nor with so much alacrity, as the latter. 'I've had enough of your Carse men,' said the farmer to us one day, and his reason was as nearly as possible in the following words:—'They've got a wretched system of long hours in the north: they work the very spirit out of their men, and so it is that these have not half the smeddum (smartness) of our Fife lads. They've neither the same skill nor activity, and when a push comes, I would make my foreman work round a couple of them.' But you'll find them very willing and obliging? 'Oh yes, they are patterns in that respect, and are certainly not so independent in their way as our own blades; but they want the energy and aptitude, and really don't give their work the same finish. For one order that I have to give to my own men, I have to give two to them. They'd hang as long as I like at the plough-tail, but I want *through-put*; and so commend me to my own men and reasonable hours.' Now, these are not the preachings of any of your sentimentality men, but the plain words of a hard-driving money-making Scotch farmer, who saw from this comparison the obvious advantage to himself of keeping his men on short hours, and of never exacting from them more than they could do cheerfully and well.

The same argument applies to every species of labour, and with double force to those employments which require intelligence and care. As soon as the body begins to tire, the spirit droops, the attention flags, and if positive carelessness does not supervene, there follows at all events a dulness and lethargy which are anything but favourable either to amount of work or to manner of execution. Nor can there be any remedy for this but rest and repose. It is true you may apply artificial stimulants; but these, too, will shortly fail; and their use only renders the bodily system of their victim the less capable of being re-invigorated. These remarks apply in a special manner to in-door labour, where the long-hours abuse is more frequently seen, notwithstanding that a restrained position of body, want of fresh air and ventilation, should be potent arguments for a course quite the reverse. Nor do we argue upon mere theory, for in this case, as in the other, we have fortunately a most convincing illustration at hand. It is that of a large spinning-mill, situated beside a country village for the sake of water-power, and in which the hours of labour are from six in the morning till seven at night, deducting an hour for breakfast and another for dinner, thus reducing the hours of actual work to eleven—a space still too long, but considerably shorter than that required in any other of the neighbouring factories. In addition to this reduction, the wheel is stopped at five o'clock on Wednesdays and at three on the Saturdays; three half days a-year are allowed for fairs, two days for church fairs, two for New-Year's day and Handsel Monday, and one for the anniversary of the mill's erection—an event seemingly of great local importance. Now, however small this may seem to some, it is in reality an amount of freedom and relaxation not enjoyed, so far as we are aware, in any similar establishment. And what, according to the owner, has been the result? *Not a single spindle of yarn less, a great reduction of disease, better executed work, fewer accidents of damage to the machinery, a more orderly and more obliging set of work-people, besides the satisfaction that he is contributing in some degree to the happiness of his fellow-creatures.* It may seem contradictory at first sight, that a reduction of hours in such an establishment should not be followed by a diminution of pro-

duce; a little reflection, however, will clear away the dubiety. The last two years' wage-book shows the merest trifle of absence from ill-health; the lessening of damage has caused fewer stoppages, and even a greater degree of speed can be obtained, inasmuch as the attention of the workers is never relaxed by long and tedious confinement. The stoppage on Wednesdays permits the women to attend a little to their domestic concerns, while it allows the mill to be cleaned and the machinery to be overhauled; the advantages of the Saturday afternoons are too obvious to be adverted to.

From these examples, then, we think it sufficiently obvious that moderate hours are conducive alike to the interests of employer and employed. The latter enjoys more the life of a rational creature, and the former rather adds to, than subtracts from, his gains, inasmuch as he has the same amount of work, and has it more highly and more carefully finished. It may be urged, to be sure, that there is no tiring of the steam-engine and machinery, and that the longer these revolve, the larger the amount of produce. This would be true and just if the machine were self-acting; but in nineteen cases out of twenty, it requires the regulation and aid of human hands, and it is to these that our argument applies. We have no objection that a man work his machinery till every wheel and axle be worn to a skeleton, for its place can be readily supplied; what we condemn is the grinding of workmen to a similar condition, when it is obvious that an opposite course is in the long-run the more advantageous. The steam can be let on at pleasure to the steam-engine, but the strength of a worn-out man cannot be renewed by any similar process: he must have leisure and repose; and where this is denied him, his bodily mechanism must shortly become diseased and impotent. It forms a sorry excuse for the employer to urge that, as he has laid out some forty or fifty thousand pounds in machinery, so he must 'keep the steam up,' in order the more speedily to repay himself; nor does it better his position to put, as is sometimes done, the question—Would you have all that machinery to be employed only ten hours out of the twenty-four? What, indeed, is the use of machinery, if it be not to lessen the amount of human labour and drudgery; and what the purpose of the invention of mind, if it be not to increase the amount of our comforts and happiness? It would appear, were we to admit the arguments of some folks, that the purpose of machinery was rather to enliven than to exalt mankind; and it is curious that many manual employments, such as those of the mason, joiner, slater, labourer, and the like, should have custom sanctioning the labour hours from six to six, with breakfast and dinner intervals, while those which have been called into existence by machinery have been tasked like slaves from five to seven, or even beyond these limits. Nor is it the reasoning of a humane or enlightened mind to reply, that if the workmen feel themselves aggrieved, they can turn to some other employment. Is it right for any man, because he has power on his side, to abuse it; or can the fact of a few thousand pounds' possession dissociate him from his fellow-men, or free him of the reciprocal duties which the necessities of our condition have imposed? Every argument that militates against the great law of brotherly love must be unsound; and it is only because this law is but too little respected, that there is so much of inequality, oppression, and poverty amongst us.

Against this view of short hours of labour it is sometimes urged, that if ten hours can be proved to be more advantageous than twelve, would not eight or six be more advantageous still—and where, then, were the limit to the diminution? This species of reasoning is entirely beside the question. A certain amount of labour is to be performed, by an agent having limited powers; there must be an average at which this power can be exerted, and our argument only goes this length, 'that it is more profitable to tax these powers within than beyond this ascertained average. In dealing with human power, we cannot apply the mathe-

matical formula by which we calculate the force of gravity, of heat, or any other purely physical agent; but we must regard it as a power imbued with mind, and as a power which nature re-invigorates by one process, and one alone. Again, it is said that any additional leisure would in all likelihood be devoted to idleness or dissipation; but, founding upon past experience, we have no ground for such a decision. It would not be idleness, surely, for the toiled mechanic to betake himself to the fields and lanes for that air which the pent-up workshop denies; nor would it be dissipation to indulge in the harmless games of the public green, or in the amusements of our halls and lecture-rooms. Or, granting that some were to dissipate, are we to withhold from eighty a just and natural boon because twenty choose to abuse it? The truth is, that where there has been little time for mental culture, we are not to wonder at some little abuse of any new privilege, and we can only hope for the rectification of such faults when men have more leisure to learn better modes. A holiday to our population at present is a boon so seldom granted, that it acts upon them like intoxication; and any extravagances they may commit should be laid to this account, rather than to any innate disposition to absurdity and folly. But be this as it may, we have taken up the reduction of the hours of labour upon other grounds—namely, its obvious advantage to the masters themselves—throwing aside altogether every consideration as to humanity, and leisure for moral and intellectual culture; and we leave it for the reader to determine whether our reasonings be in any degree corroborative of our opinion.

MEXICO AS IT IS, AND AS IT WAS.

SECOND ARTICLE.

MEXICO, when Cortes conquered it, was the capital of a great and powerful nation, regulated by good laws, well and speedily administered. The relations of life were recognised and guarded; a good system of education was fostered; the arts were cultivated and encouraged; architecture had advanced to a high degree of excellence; the knowledge of astronomy, and of the calculation of time, was exact and scientific; they were powerful in war; they had built a vast empire; springing from a sparse tribe which found its first home among the reeds and marshes of the lake where they had hidden for safety from their foes; and though their religious rites were brutal and bloody, they had some faint ideas of an invisible and omnipotent God. In their capital they chiefly showed their power; and when Cortes gazed down upon it from the top of the great temple, streets, canals, shrines, presented themselves; large and beautiful houses amid groves and gardens; markets with every fruit and vegetable luxury; aqueducts bringing sweet water from the hills; streets filled with artists who wove beautifully pictured garments from plumes of birds, or fashioned the precious metals into gorgeous ornaments; palaces, houses, all crowded with a busy, active, and brave throng; and lakes covered by floating gardens. The town was entered by four causeways over the lake, made by the hand of man, as wide as two horsemen's lances; the streets were one half land and the other half water, along which the inhabitants, says Cortes in his letters, went in their canoes; all the streets at given distances were open, so that the water might pass from one to the other; and at all the openings were very wide bridges, made of massive beams joined together and well wrought. Montezuma was usually carried about in a litter, under a canopy of the richest material, ornamented with green feathers, gold, and precious stones; his buskins were of pure gold, ornamented with jewels. The clothes which he wore one day he did not put on for four days after. His cooks had upwards of thirty different ways of dressing meats, and they had earthen vessels so contrived as to keep them constantly hot. It is said that at times the flesh

of young children was dressed for him; but Bernal Diaz is very doubtful on the point: his ordinary meats were domestic fowls, pheasants, geese, partridges, quails, venison, Indian hogs, pigeons, hares, and rabbits, with many other animals and birds peculiar to the country. At his meals, in cold weather, a number of torches of the bark of a wood which makes no smoke, and has an aromatic smell, were lighted, and, that they should not throw out too much heat, screens ornamented with gold, and painted with figures of idols, were placed before them. The table was covered with white cloths and napkins; and four beautiful women presented him with water for his hands, in vessels which they called *zicales*, with other vessels under them, like plates, to catch the water. Two other women brought small cakes of bread; he ate little, but drank, says Diaz, 'cocoa and chocolate' foaming hot. The following, which shows the antiquity of *tortillas*, and the similarity of the ancient with modern habits, we extract from Bernal Diaz:—'During the time that Montezuma was at dinner, two very beautiful women were busily employed making small cakes with eggs and other things mixed therein. These were delicately white, and, when made, they presented them to him on plates covered with napkins. After he had dined, they presented to him three little canes, highly ornamented, containing liquid amber, mixed with an herb called tobacco.' The accounts of Montezuma's rents in books occupied an entire house. His arsenals were well supplied, his country palaces were splendid, his menageries full and curious. All this Cortes, who at best was a great pirate, destroyed seeking for gold; and on the ruins of the magnificent empire of Montezuma stand the present wretched people.

The upper classes have still all the ancient love of splendour, and their houses are both elegant and comfortable. The streets of Vera Cruz are paved with smooth pebbles, and the side walks covered with cement. The mansion of a Mexican gentleman is built of the strongest materials, and erected round *patios*, or courtyards. On the ground-floor are the porter's lodge, offices, and carriage-house; a flight of steps then leads to a second storey, devoted to the domestics; while the upper is usually the fashionable and best one. Here the inmates are in perfect seclusion from the street and neighbours; and the arcade which fronts their doors is filled with the choicest fruit and flower trees in constant bloom. Above all this is the *azotea*, or flat-paved roof, a delightful retreat on summer nights. The front windows of the houses are all guarded by balconies covered with gaily-coloured awnings. The carriage and ever-harnessed mules stand constantly in the courtyard below, and the postilion is ready to mount at a moment's notice, until after dark, when the front gate is locked and barred. The prevalence of robbery and murder is the origin of this caution.

The unequal division of property is one fertile cause of the general poverty. Some of the estates are enormous; but as capital is scarce, an air of desolation is the sole consequence. On every side are marks of solitude and misery; ruins of houses and churches filled with weeds and creepers; neglected fields overgrown with aloes, and made still more sad by the long pensile branches of the solitary palm: nature, instead of being pruned of her luxuriance with judicious care, has been sapped and exhausted, and made old even in her youth. Traces of old cultivation are yet to be found, and also the remains of a former dense population. The sides of the hills in many places, as in Chili and Peru, are cut into terraces; but over these is spread a wild growth of mimosas, cacti, and acacias, while a thousand flowering parasite plants trail their gaudy blossoms among the aloes and shrubbery. Still there is much wealth left; and on a hacienda near Cerro Grande, a lady, according to Kendall, had 50,000 horses and mules, large herds of cattle, immense fields of corn and wheat, and several thousand peons, or labourers. A short time prior to the revolution, three hundred thousand horses were in the

possession of the owner of the estate: during this period a regiment of dragoons arrived from Spain, and landed at Tampico. 'This regiment was one thousand strong, and of course the men did not bring their horses with them. The colonel of the regiment happening to be a friend of the family, and well known to the deceased husband of the wealthy proprietress, she immediately sent him a thousand white horses, as a present for the use of the regiment. There was hardly a month's difference in the ages of these horses, and every one of them had been raised upon her estate.'

The condition of the labourers on these estates is wretched. Buying their liquor, cigars, and cloth at most exorbitant prices from their employers, they are in general indebted to the proprietor, and as the law gives him a lien upon their services until such debts are paid, good care is taken that they never pay him their obligations as long as their services are in any way profitable. They are in his debt until too old to work, when the obligation is canceled, and they are cast upon the world to beg, starve, or steal, as best they may. Should any active man save enough to redeem himself, the rich proprietor is sure so to twist the law, and influence the *Alcalde*, that the serf is reduced once more, by means of some legal quibble, to bondage. In fact, the immense wealth of the few, and the poverty of the many, places the people of the Mexican republic in nearly the same position as were the English under the feudal system; which goes far to prove, that freedom of government is of no value to man, without the education which fits him to enjoy liberty.

The soldiers which are recruited from so tame a people are necessarily inferior; and yet their cavalry, headed by good officers (rarer in Mexico even than good soldiers), have proved far from contemptible. Nothing can be conceived more original than the mode of recruiting. A number of men are perhaps wanted to complete a new company, and a sergeant with his guard is forthwith despatched to inspect the neighbouring Indians, and *Meztizos* or half castes. The subaltern finds a dozen or more working in the fields, and without even the formality of a request, immediately picks his men, and orders them into the ranks. If they attempt to escape or resist, they are at once lassoed; and at nightfall the whole gang is marched, tied in pairs, into the quartel of the village or the guard-room of the palace. Next day the volunteers are handed over to the drill sergeant; and nothing can be more comic than their first parades. About one half are always Indians, and the rest perhaps *leperos* or loafers. One has a pair of trousers, but no shirt; another a shirt and a pair of drawers; another hides himself as well as he can under his blanket and broad-brimmed hat; another has drawers and a military cap. 'The most ridiculous object,' says Meyer, 'I remember to have seen in Mexico, was a fat and greasy lepero, with a pair of trousers that just reached his hips, supported by a strap round his loins, with an old uniform coat a great deal too short both in sleeves and in front. Not owning a shirt, a vast continent of brown skin lay shining in the sun. He held his head, supported by a tall stock, higher than any man in the squad, and marched magnificently.' At Manantial, our American traveller examined the arms of his guard, not looking, however, at more than one carbine, which he found had lost the catch of its cock, which of course always lay against the covering of the pan, pressing it open. Meyer mentioned this to the trooper, and asked him where he put the powder. 'There, to be sure,' said he, pointing to the pan. 'And how do you fire it?' 'Pahaw,' replied the fellow, 'tis better so.'

The climate in Mexico is very varied; for between Vera Cruz and the volcanoes, where eternal snows hang over Mexico, you have every climate in the world. In the valley there is an eternal spring; for six months, the winter months, rain never falls; during the others, showers occur almost daily. It is never hot—never very cold. One side of the street is always too warm at noon. In January, the roses are already blooming in the

gardens of Mexico. The flower and the leaf you admire to-day, are replaced to-morrow by fresh buds and renewed verdure. Sickness in Vera Cruz is great, and most fatal in its results, especially vomits. There are two influences at work to counteract the pestilent influence, and prevent the additional power of dirty streets in spreading malady, the zopilotes or turkey-buzzards, and the galley slaves, who both act as scavengers. To kill a zopilote is a high crime; they are under the protection of the laws, and walk the streets with the utmost nonchalance.

One relief against the pressing urgencies of poverty in the capital is the Monte Pio, or national pawnbroker establishment. It is situated in the great square, occupying the building known as the palace of Cortes, said to be erected on the ruins of the ancient palace of Montezuma. This is a most beneficent institution, and was founded in 1775 by the Conde de Regla, at a cost of 300,000 dollars. Since that time, it has been carefully administered by government, and affords succour daily to more than two hundred persons. It is ruled by a general board of directors, and receives pledges of clothes, jewels, plate, and every species of valuables. These articles are appraised at a fair valuation, the amount of which, deducting the interest, is paid to the pawnier; they are then retained for six months, during which the owner can redeem them; but if the money be unrefunded at the expiration of that period, the pledges are disposed of by public sale; and should they produce anything over the valuation, the difference is handed to the owner. During the revolutionary difficulties of Mexico, this institution has saved many from disgrace and misery, 2,232,611 persons having availed themselves of it; 81,674,702 dollars* (besides 134,740 dollars given in alms) had been loaned up to 1836; and in 1837, the sum of 477,772 dollars was spent in aiding the distresses of the poor. A walk through the extensive apartments of the Monte Pio tells a tale concerning the rank and variety of persons who avail themselves of its services, which would be anything but pleasant to some even of the noble families in Mexico. You will find every species of garment, from the tattered reboso of the lepero to the lace mantilla of the high-born lady; every species of dress, from the blanket of the beggar to the military cloak and jeweled sword of the improvident or impoverished officer; and as to jewels, the choice is infinite.

In the immediate neighbourhood of this building is the Accordada, or common prison, in front of which, on an inclined plain, are laid the dead bodies found daily within the limits of the city; within are the living. Passing through several iron and wood-barred gates, you enter a lofty corridor, running round a quadrangular courtyard, in the centre of which is a fountain of troubled water. The whole of this area is filled with human beings—the great congress of Mexican crime, mixed and mingling like a hill of busy ants. Some are stripped and bathing in the fountain, some fighting in a corner, some making baskets. In one place, a crowd is collected round a witty story-teller relating the adventures of his rascally life; in another, a group is engaged in weaving with a hand-loom. Robbers, murderers, thieves, felons of every description, are crammed within this courtyard. A brief glance at the statistics of crime for the year 1842 in the city of Mexico, will account for the crowded state of the prison. For bigamy, and more heinous crimes consequent on incontinence, 491, of which 179 were women; robbery, 1970, of which 470 were women; quarrelling and wounding, 3233, of which 1104 were women; quarrelling, bearing arms, 1056, of which 444 were women; homicide attempted, &c. 87, of which 17 were women; violence, &c. 86, of which 17 were women; forgery, 8, of which one was a woman; gambling, 3 men; besides for higher crimes, 1927. Further numbers were committed for throwing vitriol; 113 dead bodies were found, 894 sent

to the hospital, and 17 executed by the garotte;* in all, 8861, an amount of crime, with a population of 200,000, almost unparalleled.

Smoking is the constant practice of all classes and sexes. The ladies of highest rank take their little aromatic cigaritto, and use it in a peculiarly graceful manner, if anything so unfeminine can in any way appear graceful. When on a morning visit, if you are a particular favourite, the lady of the house, who indulges in the weed, will take a delicate one from her golden *stui*, light it, touch it with her lips, and present it to you. It is, however, an almost universal custom in Spanish and Portuguese America, and Stephens relates many amusing instances of it in his several productions. The great amusement of the Mexicans is the play, the excessive indulgence in which amusement makes the women live too much abroad, and is injurious to their habits: the dull morning at home is succeeded by an evening drive, and then again by the regular visit to the opera or theatre, where they hear the same things over and over again. Were the entertainments of an intellectual character, less harm would arise; but the taste is all for comedy, or domestic tragedy of the Newgate school. The boxes are usually let by the month or year, and are filled by the families in full dress every evening, who there receive their friends. The pit seats are arm-chairs, which are also rented by the month. The music—a science in which, both in taste and execution, the Mexicans excel—is far better than the acting. Without the least knowledge of music as a science, the common people are still fond of carolling the little airs of the country in chorus, and have ears exquisitely correct in singing the different parts. Frequently, while upon the road, the Mexican prisoners or volunteers may be heard giving their native songs with pleasing effect. The different voices, from the highest falsetto to the deepest bass, were many of them of the purest and softest quality, and blended together with a harmony at once musical and soothing.

Bull-fights—the great amusement of the descendants from the Spanish conquerors—still occasionally take place in the Plaza de Icroz, an immense circus, erected when this sport was in its palmy days in Mexico, and are usually given on Sunday, when the people are quite unoccupied. This is about one of the most savage of all the amusements which have ever been devised. When the Romans had exhausted the whole round of natural excitement, they invented the circus, which tended as much as anything to brutalise and degrade that falling empire. In Mexico, the results are most demoralising; not more so, however, than the national taste for gambling, a vice in which all classes indulge. The feast of St Augustin, at San Augustin, is the signal for a great day of gambling. There are humble booths where small copper coins only are played; next for copper *medios* and *reals*; next for copper and dollars; then banks for silver alone; then for silver and gold; and lastly for gold alone. All the banks save one lost on the occasion of Meyer's visit; and the gains of the lucky corporation must have been immense, as at one time it lost 2000 doubloons, equal to about £8000. The cockpit follows, where ladies of the highest respectability appear, their great object being to outshine each other in the splendour and variety of their garments. The rage is to have one dress for mass, one for the cockpit, one for the afternoon ball, and the other for the evening one on the occasion of the fête above alluded to. The cocks were placed in the centre of the pit, within the ring, the president's fowls being there generally first put on the earth. They were then thrown off for a spring at each other, and taken up again before the betting began. Brokers went round, proclaiming the amount placed in their hands to bet on any particular fowl. Whenever a bet was offered against Santa

* The culprit is seated in a chair, and his neck placed in an iron collar, which may be turned by a screw; a sudden turn drives a spike through the spinal marrow, and life is extinct.—See Meyer's Mexico. London: Wiley and Putnam.

* The Mexican dollar varies in value from 4s. to 4s. 4d.

Anna's bird, the broker was called to his box, and an *aide* covered it. Besides these bets, the general usually had some standing ones agreed on beforehand with the owners of other cocks; and in this manner five or six thousand dollars were lost or won by him in the pit daily.

The amusements of the humbler classes in the rural districts—consisting chiefly in fandangoes or balls, where the elders look on while the young people dance, laugh, and enjoy themselves—are somewhat more rational and humanising than those which delight the heads and rulers of a nation which has very far yet to advance to lay even a primary claim to be rated among the civilised lands of the earth.

RIDING THE STANG.

About noon, when labour daily and usually refreshes itself, an uncommon stir was observable among the lower classes of the town population—something like what precedes the swarming of a bee-hive. By and by appearances took a more definite form, and a number of women and children were seen crowding together, shouting and clamouring, and rattling with sticks and pans, and, in short, raising a most intolerable din; in the midst of which, the name of one obnoxious individual was ominously heard. The characteristics of a Scotch mob are pretty generally known, before and since the fate of Captain Porteous. They are furious and formidable; and when once the passions of a generally calm and prudent race are excited, be it to lower the price of meal, or to carry any other popular purpose, it requires no small force to resist or modify the impulse. On the present occasion, rough-looking men began to mix with the screeching multitude, and soon were visible a stout posse of them, armed with a pitchfork. The idea that murder was about to be committed thrilled the blood of the uninformed spectators, and their terror increased when they witnessed a fierce assault made on a low tenement inhabited by the person (a shoemaker) so dreadfully denounced, who had barely time to look and barricade himself from the threatened vengeance. In vain. The windows and doors were smashed and battered in, and a violent tumult took place in the interior. Within two minutes the culprit was dragged out, pale and trembling, and supplicating for mercy. But he had shown little to his wretched partner, who, with a blackened eye, weeping bitterly, and also begging them to spare her unworthy spouse, who she was sure would never strike her again, joined her pitiful intreaties to his. The ministers of public justice were inexorable—his sentence was pronounced, his doom sealed. The portentous pitchfork was immediately laid horizontally from the shoulder of one to the shoulder of another of the ablest of the executioners, who thus stood, front and rear, with the *stang* (the shaft) between them. Upon this narrow-backed horse the offender was lifted by others, and held on by supporters on either side, so that dismounting was completely out of the question; and there he sat elevated above the rest, in his most uncomfortable and unenviable wooden saddle. The air rung with yells of triumph and vituperation. Very slight arrangements were necessary, and the procession moved on. The wife, surrounded by a party of her gossips, was compelled to accompany it; and it bent its course toward the river side. The unmanly fellow who had provoked this fate, showed by his terrors that he was just one of those cowards who could ill-treat the creature who had a right to his protection, and had not fortitude to endure an evil himself. He howled for compassion, appealed by name to his indignant escort, and prayed and promised; but they got to the brink of that clear and deep pool which mirrored the glittering sun above the mill wheel (or *cauld*, *Scottish*), and there the bearers marched boldly in before they tumbled their burden from his uneasy seat.

Into the water he went over head and ears, and rose again, by no means 'like a giant refreshed'; and no sooner did he reappear, than a powerful grasp was laid upon him, and down again he was plunged, and replunged, with unrelenting perseverance. The screams of his distracted wife fortunately attracted the attention of a magistrate (my revered father) whose garden shelved to the edge of the stream where this scene was enacting, and he hastened to interfere. Had he not done so, life might probably have been lost; for the ruffian was execrated by his fellow-men for his continued abuse of late a pretty, sweet, and healthful maiden, now a pale-faced, bruised, and sickly matron, and one too of meek and unresisting temper, suffering cruelly without offence. As it was, the populace listened to the magistrate's voice, for he was much beloved by them; and giving the rascal one dash more, allowed him to crawl to the bank of the silver, now polluted, Tweed. From thence he was hooted the whole way to his home; and so salutary was the effect of the day's proceedings on the half-drowned rat, that he never more misbehaved in such a manner as to render himself liable to *ride the stang*.—*Archæological Album*.

THE SONG OF THE SPADE.

ALL honour be paid to the homely spade—
The sword and the spear are idle things—
To the king in his pride and his subjects beside,
Its tribute the spade of the husbandman brings.

A bright thought from heaven to the tiller was given,
Who first turned up to light the soil richly brown:
God told in the blast how the seed should be cast—
See the first yellow grains by the husbandman sown!

See the first harvest-morn, and the ripe yellow corn,
And the first crooked sickle thrust into the grain!
With dancing and singing the valleys are ringing,
For all that the spade has raised out of the plain.

Then all honour be paid to the conquering spade—
The sword and the shield are idle things—
To the king in his pride and his subjects beside,
Its bounties the spade of the husbandman brings.

J. G.

MAGNANIMITY.

In Germany, during the war, a captain of cavalry was ordered out upon a foraging expedition. He put himself at the head of his troop, and marched to the quarter assigned him. It was a solitary valley, in which hardly anything but wood was to be perceived. Finding in the midst of it a small cottage, he approached and knocked at the door, which was opened by an old and venerable man, with a beard silvered by age. 'Father,' said the officer, 'show me a field where I may set my troop to foraging.' The old man complied, and conducting them out of the valley, after a quarter of an hour's march came to a fine field of barley. 'Here is what we are in search of,' exclaimed the captain; 'father, you are a true and faithful guide.' 'Wait yet a few minutes,' replied the old man; 'follow me patiently a little further.' The march was accordingly resumed, and at the distance of a mile they arrived at another field of barley. The troop immediately alighted, cut down the grain, trussed it, and remounted. The officer thereupon said to his conductor, 'Father, you have given yourself and us unnecessary trouble; the first field was far better than this.' 'Very true, sir,' replied the good old man, 'but it was not mine.'—*St Pierre*.

The present number of the Journal completes the third volume (new series), for which a title-page and index have been prepared, and may be had of the publishers and their agents.

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF 'CHAMBERS'S INFORMATION FOR THE PEOPLE,' 'CHAMBERS'S EDUCATIONAL COURSE,' &c.

No. 79. NEW SERIES.

SATURDAY, JULY 5, 1845.

PRICE 1½d.

PERSISTENCY OF FAMILY FEATURES.

It is well known that personal peculiarities of all kinds, defects as well as beauties, casts of features, and traits of expression, are transmitted from parents to their children. The fact stares us in the face whenever we enter a family parlour, for there it is invariably seen that the young people bear a resemblance in one respect or another to either their father or mother, or to both. This is a subject which has never, as far as we are aware, been honoured with more than a transient notice at the hands of the learned; yet it might be worthy of philosophical investigation. We merely propose, in this place, to illustrate it by a few facts which we have picked up either from personal observation, or from books.

Sometimes the reproduction of face and figure in the child seems almost perfect. Sometimes face is borrowed from one parent, and form of head, or of body, or of some of the limbs, from the other. Occasionally, there is a remarkable blending of the two throughout the whole, or parts of the person. Even peculiarities in the carriage of the head or of the mode of walking are transmitted, and a family voice is nearly as common a marvel as a family face. A man, in a place distant from his home, and where he was totally unknown, has been distinguished as the brother of one known there by the sound of his voice heard in a neighbouring apartment. But the almost perfect reproduction of the elder Kean's voice in the younger is perhaps the most convincing illustration we could adduce upon this point. It will also be found that children resembling either parent externally, have a stronger affinity of mental character to that parent than to the other. A gentleman, very intimately known to us, is strikingly like his father, who has been deceased since his early youth: he also exhibits the same dispositions and intellectual tendencies in a remarkable degree, delights in the same studies, has the same turn for the perception of human character; nay, he often feels, in the simplest procedure of common life, so absolute an identity with what he remembers of his father in the same circumstances, and at the same period of life, as expressed by gesture and conversation, that it seems to him as if he were the same person. Nor can this, he says, be a result of imitation; it is something which takes place independently of all design, and which he only remarks, in general, after the act, or feeling, or movement which recalls his father, has passed.

But it is not parents alone who are thus reproduced in new generations. In a large family familiarly known to us, as are all its relationships, we see, in some of the young persons, resemblances at once to the father and mother, and to one or other of the two grandfathers and

grandmothers, notwithstanding that, in one or two instances, the intermediate generation did not bear those features of the first which are traced in the third. It thus appears that a peculiarity will sink in one generation, and re-appear in the next. Perhaps even more generations than one are occasionally passed over. In this family, several of the children are totally different from the rest; complexion, form, gesticulations, voices, all peculiar. This seems to be owing to their 'taking after' different parents, or the families to which the different parents belonged. What makes this the more remarkable is, that one of these children, while in all respects unlike certain brothers and sisters, has one feature strikingly recalling the image of a distant cousin—a character of feature not seen in any other existing member of the family, and not remembered of any that are deceased. It would appear as if these minutiae of family characters fitted about fitfully and vaguely, and only settled now and then upon individuals in a clan—sometimes upon not more than two, or perhaps upon one only, in the same age. From all of these facts, it may be inferred that the strong resemblances sometimes remarked between cousins are indications of their representing a common original, and of their being in reality more consanguineous than are many brothers and sisters. The unsuitableness of such relations for matrimonial alliances, must of course be affected by this consideration. Where resemblances exist, their union may be held as even more decisively condemned by nature, than is that between brothers and sisters who are not obviously alike.

The limitation of portrait-painting as to time, is a bar to our knowledge with regard to instances of long transmission of family faces and features. Yet enough is ascertained to establish the law of the case. In our own royal family, a certain fulness of the lower and lateral parts of the face is conspicuous in the portraits of the whole series of sovereigns, from George I. to Victoria. It has been equally seen in other members of the family. The Duke of Cumberland, who figured at Culloden, presents generally the same visage as several of the sons of William IV. This physiognomy may be traced back to Sophia, the mother of George I.; how much farther, we cannot tell. It is equally certain that a thickness of the under lip, peculiar to the imperial family of Austria (Maria Louisa is said to be characterised by it), has been hereditary in the race since a marriage some centuries ago with the Polish house of Jagellon, whence it came.

A remarkable anecdote illustrative of this subject was told us, some years ago, by a gentleman who has since distinguished himself in the walk of fictitious literature. Born in Nova Scotia, where his family, originally Scotch, had been settled for the greater part of a century, he had not an opportunity of visiting our

country till past the middle of life. Here he made it his endeavour to see as many as possible of the individuals bearing his rather uncommon name, and in this quest he often took journeys to considerable distances. Having heard of a family of the name residing at a lonely farm amongst the Lammermuir hills, he proceeded thither on foot from the nearest market town. As is not uncommon in such situations, the approach of a visitor could be observed from this house while he was yet fully a mile distant. Mr H— was observed at that distance by some of the children, who immediately cried out with one voice, 'There is uncle George!' When the stranger arrived at the house, the seniors of the family fully acknowledged the general resemblance of the figure and carriage to the person called uncle George; and it was ascertained, after a little conversation, that the Nova Scotian was in reality their cousin at two or three removes.

When Mr William Howitt visited Stratford-on-Avon, in order to write respecting the places connected with Shakspeare, the schoolmaster informed him that a descendant of a near relation of the poet was one of his pupils. 'He marshalled his laddish troop in a row,' says Mr Howitt, 'and said to me, "There, now, sir, can you tell which is a Shakspeare?" I glanced my eye along the line, and quickly fixing it on one boy, said, "That is the Shakspeare." "You are right," said the master, "that is the Shakspeare—the Shakspeare cast of countenance is there. That is William Shakspeare Smith, a lineal descendant of the poet's sister." The lad,' continues Mr Howitt, 'was a fine lad of perhaps ten years of age; and certainly the resemblance to the bust of Shakspeare, in the church at Stratford, is wonderful, considering he is not descended from Shakspeare himself, but from his sister, and that the seventh in descent. What is odd enough, whether it be mere accident or not, the colour of the lad's eyes, a light hazel, is the very same as that given to those of the Shakspeare bust, which it is well known was originally coloured, and of which exact copies remain.* These observations of Mr Howitt are confirmed by a portrait of the youth, which he gives in his book. We are the less disposed to entertain doubts on the subject, in consequence of circumstances which have fallen under our own notice. Some years ago, a young man in humble life came forward to claim the restoration of the forfeited titles of the Setons, Earls of Wintoun, his grandfather having been assured that he was a legitimate though obscurely born son of the noble, who lost honours and lands by joining in the insurrection of 1715. From want of evidence, the claim was a hopeless one, and it was not prosecuted; but of one fact there could be no doubt, that the young man so nearly resembled the sons of the fifth Lord Seton, as represented in a family picture painted by Antony More, that he might have passed for their brother. These persons lived in the latter half of the sixteenth century.

Such instances are perhaps less uncommon than might be supposed. We have seen an elderly lady descended from John Knox, and bearing no slight resemblance to him; and, if we are not much mistaken, a profile of Cardinal Beaton, in Pinkerton's Scottish Gallery, might pass for a tolerably successful likeness of his brother's descendant, the present Mr Drinkwater Bethune. These instances will, we fear, serve but inadequately to prepare the reader for another, which makes a larger demand upon his faith. Walking in the country some years ago, we saw an elderly man pass in a carriage, and were instantly struck with his resemblance to the bluff majestic countenance attributed by Scottish painters to Sir William Wallace. The im-

pression was so strong, that we spoke of it to our companion, who said, 'It is very odd, but the gentleman is General Dunlop of Ayrshire, a descendant, you are well aware, of a brother of Wallace.' We were far from the estate of the gallant general, though in the county represented by him in parliament, and had no reason to suppose that this was General Dunlop, nor did we even remember at the moment how he stood related to the Scottish hero. There is a peculiar difficulty in the case, for no reflecting person would have previously supposed it likely that the common portrait of Wallace was a genuine likeness. It can only be said that the fact of a resemblance in General Dunlop to the portrait is a strong argument, as against merely negative evidence, for its authenticity. We may suppose it to have been painted when Wallace visited France, as he is now certainly known to have done, from documents discovered by Mr Tytler. The space of time between the death of Wallace and the birth of General Dunlop must have been upwards of four centuries and a half. The improbability of a face being kept up so long in a family is, we readily own, very great, and yet only so, perhaps, because we know of no other facts to the same purport. Such facts might be found if they were sought. It is, we are assured, a common remark amongst those who remember the last Mrs Bruce of Clackmannan, who boasted that King Robert of Scotland was of *her family*, that the features of the old lady bore a resemblance to the portraits of the heroic monarch. And even now the children of one of the gentlemen of this family, settled in Clackmannanshire, are said to have that strongly-marked form of the cheek-bones and jaws which appears in Bruce's coins, as it did in the structure of his actual face, when his bones were disinterred at Dunfermline, anno 1819.

The doubts which might rest on such cases of particular resemblance in families, ought perhaps to be in a great measure dispelled, when we reflect on the evidence that exists with respect to the persistency of external characters in sets and races of people. Not only have we such facts as a prevalent tallness in the inhabitants of Potosdam, where Frederick I. assembled his regiment of longitudinal guards, and a strong infusion of Spanish features in the people of the county of Galway, in which some centuries ago several Spanish settlements were made; but we are assured by Major Bevan that he could distinguish the several castes in India by their peculiarities of countenance; and the Jews are the same people in Egyptian entablatures of three thousand years ago, as they are in some countries at the present day. Mr Kohl, in his travels in Austria, speaks of Prague as a very garden of beauty. 'For the young ladies of 1841,' says he, 'I am ready to give my testimony most unreservedly, and many an enraptured traveller has left us his books as living witnesses to the loveliness of the grandmothers and great-grandmothers of the present generation. The old chronicler, Hammerschmidt, and his contemporaries, dwell with equal pleasure on the sweet faces that smiled upon them in their days, and the picture-gallery of many a Bohemian castle is there to testify to the truth of their statements. One witness there is to the fact, whose right few will question to decide on such a point. Titian, who studied the faces of lovely women for ninety-six years, and who, while at the court of Charles V., spent five years in Germany, tells us it was among the ladies of Prague that he found his *ideal* of a beautiful female head. If we go back beyond the times of Titian, we have the declaration of Charles IV., that Prague was a *hortus deliciarum*, and whoever has read the life of that emperor, will scarcely doubt that beautiful women must have been included in the delights of a capital so apostrophised. Nay, the time-honoured nobility of the beauty of Prague may be said to go back even to the earliest tradition, where we find it celebrated in the legends of Libussa and Vlasta, and the countless songs

* Visits to Remarkable Places. First Series. Mr Howitt adds—'Ireland, when in 1783 making collections for his *Views on the Avon*, was much struck with the likeness to this bust in Thomas Hart, one of this family, who then lived in Shakspeare's house.

* A son of Mrs Dunlop, the kind patroness of Burns.

composed in honour of the Devy Slavanske or Tshek-hian damsels.*

While there is a law of persistency, there seems also to be one modifying it, a law of variation. The continuance of national features depends much on adherence to the same region of the earth, and the same mode of living. When a people migrate to a remote and differently characterised clime, they are often seen to undergo, in the next generation, a change of features and of figure. Thus the unctuous Saxon of Kent and Suffolk, when transferred to Massachusetts, becomes metamorphosed into the lank and wiry New Englander. Descendants of British settlers in the West Indies have been remarked, after several generations, to acquire some of the peculiar features of the aboriginal Americans, particularly high cheek bones and eyes deeply set in the head. It has also been remarked in New South Wales, that the generation of English born there are changed from their progenitors—taller, and less robust, besides having a share of that nasal tone which is found in the American English. These are curious facts, conveying the impression that national forms have been determined to some extent by peculiarities of climate and other external influences.

In the main, one generation is represented in another succeeding it. We die as individuals, but the character in mind and body, 'with a difference,' is revived and continued by those who come after us, and the tissue of human races is a kind of immortality.

THE SOANE MUSEUM.

Statues and paintings stand in meet array,
Things of rare grace and classic age abound;
Some hand unseen these silently display,
Even undemanded by a sign or sound.—*Thomson.*

There is a public exhibition in London, at which we have from time to time spent many hours with equal pleasure and instruction, but which, from the comparatively small number of visitors, does not appear to be so highly appreciated as it deserves. We allude to the collection of pictures, antiques, articles of vertu, &c. got together by the late Sir John Soane, and deposited in the house he occupied at No. 13, Lincoln's Inn Fields. The paucity of visitors is doubtless owing in a great measure to the restrictions under which the public are admitted; Thursday and Friday in the months of April, May, and June, being the only days throughout the year on which strangers have the privilege of viewing the place. The applicant must also attend a day or two previously to procure an order from the curator. When, however, the nature of the exhibition is considered (a great number of objects in a series of rooms, none of which are very large), it is obvious that to admit the public indiscriminately would be in effect to place a slight value upon a collection, great part of which requires considerable acquaintance with art to enjoy, and would improvidently afford opportunities, in a mixed and crowded multitude, for mischief and theft. With a view of directing the attention of visitors in the metropolis to one of its treasures, we propose concisely to describe in our present paper the principal contents of the Soane Museum. 'There is no institution in London,' says Mrs Jameson* in her description of this place, 'in which a few hours may be more pleasantly whiled away, or even more profitably employed, than in this fairy object of vertu, where the infinite variety of the objects assembled together in every department of art—many indeed sufficiently trivial, some also of peculiar beauty and value—suggest to the intelligent mind and cultivated taste a thousand thoughts, remembrances, and associations, while the ingenuity shown in the

arrangement amuses the fancy in a very agreeable manner.'

Some ornamental details on the exterior of the house point it out to the eye of the stranger; they are not likely, however, to detain it very long, and indeed observers of severe taste may wish them away. The door having opened and closed again, the first thing which will engage the visitor's attention is a bust in the entrance lobby of Sir Thomas Lawrence, who, though the son of an innkeeper, was, both in manners and bearing, one of the most aristocratic of men, the painter and companion of princes and nobles. A fine specimen of his workmanship may be seen in the next apartment (the dining-room and library thrown together), being nothing less than a portrait of Sir John Soane himself. It is an excellent painting, and cannot fail to charm every beholder by the clearness of its colouring; one hand seen hanging down is exquisitely painted. Exactly opposite hangs a picture by Lawrence's famous predecessor, Sir Joshua Reynolds. It represents a passage from the story of the goddess of beauty, and her 'wimpled, winning, purblind, wayward boy, Dan Cupid.' It shows the sad result of Sir Joshua's experimenting in oils and colours, being grievously disfigured with cracks, whilst a hectic flush on the countenances usurps the place of a healthy, rosy hue, a defect too common in the works of this painter. The pencil of Howard, R. A., has adorned several of the compartments in the ceiling, and a number of elegantly-bound books, principally relating to architecture, covers the walls. Passing through some lobby-like apartments—in which two small engravings by Hogarth might escape notice amongst the crowd of objects, if not specially pointed out—we arrive at the door of the room in which the most of the paintings are hung. But before entering, pray pause to admire the model of a sleeping child by Banks. The marble has been placed in Ashbourne church, Devonshire, to the memory of a daughter of Sir Brook Boothby. The helpless sleep of innocent childhood was never more perfectly represented; but as yet it has not been so fortunate as the sleeping children in Lichfield cathedral, for no one has uttered in verse the feelings it inevitably excites. By an ingenious arrangement, the space upon which paintings can be hung in the picture-room is considerably increased. Large shutters are made to move on hinges, and pictures are suspended on both sides. Thus the small space of 13 feet 8 inches by 12 feet 4 inches, is rendered capable of holding as many paintings as a gallery 45 feet long by 20 feet broad. The first objects that challenge attention are a series of four pictures by Hogarth, who may be truly said to have imitated none, and to be inimitable of any. They represent the scenes of an election. In the first an entertainment is depicted. Many figures are crowded upon the canvas, every one of which plays a part in a disgusting but 'owre true' story. The riotous license too frequently attendant upon such occasions is drawn with forcible ludicrousness. Some are seized with apoplexy, others are desperately wounded with brickbats; but still the gluttons and drunkards around continue their eating and drinking. A man who has had his face daubed with soot, talks with great animation, in entire ignorance of the cause of his neighbour's laughter. In one group a tailor, who is simple enough to keep about him that embarrassing article, a conscience, and resolutely refuses a bribe, is fiercely attacked by his termagant wife, whilst his son shows how his toes have become visible at the end of his shoe. The canvassing follows, and then the polling, where the booth is filled with freeholders, deaf, sick, maimed, and blind, as if the very hospital had been ransacked for voters. In the fourth picture, the successful candidate is seen to possess but a precarious tenure of his chair. The incidents by which this awkward result has been brought about are whimsically complicated and amusingly depicted. The member here represented was Bubb Doddington, afterwards Lord Melcombe Regis, a man of the lowest political morals, who naively revealed his sins in a self-complacent diary. To him

* 'Handbook to the Public Galleries of Art in and near London,' a work calculated to diffuse true and elevated ideas on the subject to which it relates, and forming a delightful and invaluable companion for the student of art to the metropolitan collection of pictures.

Thomson dedicated his Summer, and we find him there invested with those excellences with which the imagination of poets is accustomed to endow their patrons. Amongst the rest,

Unblemished honour, and an active zeal
For Britain's glory, liberty, and man!

These pictures were once in the possession of David Garrick, having been purchased by him from the painter. Sir John Soane bought them for 1650 guineas, when the effects of the actor's widow were sold. In another series of eight pictures, the *Rake's Progress* is delineated with fearful truthfulness. Repeated engravings have made these paintings well known. A course, tainted even at the beginning with depravity, then cursed with riches, is traced through darker and darker profligacy to a prison, and from that depth to a still lower—to the furthest point and most loathsome form of human degradation—madness. The moral of Hogarth's pictures it is needless to comment on. The lessons our pictorial Crabbe teaches are obvious to every eye. 'Never did I derive,' says Mr Hartley Coleridge in one of his charming essays—'never did I derive from Hogarth's paintings an unfriendly feeling towards my kind—never did they shake my faith in the true nobility of man's nature, which is ennobled not by what it is, but by what it should be. So far from it, I affirm that they bear irrefragable testimony to a principle, a moral law in man, that is above the understanding—not begotten upon sense, nor constructed by custom, self-love, or animal sensibility, but implanted by the Divinity as the key and counterpart to the law from on high.' This series was purchased from Alderman Beckford for only £598. If now brought into the market, they would probably fetch six times that sum. Mr Beckford was also the possessor of six pictures representing the *Harlot's Progress*; but these were unfortunately consumed in the fire which destroyed old Fonthill in 1755. In this room may be seen the masterpiece of Canaletto. A fine work of his hangs in the National Gallery; but this is still finer. Indeed it would have been impossible for him to surpass the natural appearance here given to the surface of the water. The eye runs up the grand canal (the scene is Venetian) with astonishment at the illusive perspective, and the figures managing a boat in the foreground are brought out with wonderful distinctness. Above are two small Canalettos, one of the Bridge of the Rialto, the other of St Mark and its tall campanile. The clear precision with which Canaletto is able to place objects upon canvas, and to show them through an atmosphere of the utmost purity, make his pictures at first look almost as hard as an architect's plan; but their mannerism is soon forgotten, and their truthful representation meets with its merited applause. He may be styled the most poetical of architectural limners. His works have always been great favourites in England, where there are in consequence many vile imitations. An Italian lake is the subject of a large picture by Sir Augustus Calcott, but to us it appears unfortunate in its tone of colour. There are several other paintings by Fuseli, Danby, and others. Four designs drawn by the founder of this museum are a display, to use his own language, 'of the architectural visions of early fancy, and wild effusions of a mind glowing with an ardent and enthusiastic desire to attain professional distinction in the gay morning of youth.'

We may now descend into the cellarage, stuffed as full as the upper storeys, and divided into apartments fantastically termed 'the Monks' Parloir, Oratory,' &c. Here are to be found numerous antique objects, such as carvings in ivory, painted glass, and Peruvian vases. Passing into the adjacent corridor and anteroom, we behold numerous fragments and casts in plaster of classic statuary and architecture. But by far the most interesting object is the Egyptian sarcophagus, discovered by Belzoni in 1816 in a tomb in the valley of Beban-el-Malook, near Gournou. Its length is nine feet four inches, and its greatest width three feet eight

inches, with an average depth of two feet and a half. It is cut out of a single piece of Arragonite, of such transparency, that the rays of a candle penetrate through it where it is three inches thick. 'What we found in the centre of the saloon,' says Belzoni in his narrative, 'merits the most particular attention, not having its equal in the world, and being such as we had no idea could exist. It is a sarcophagus of the finest Oriental alabaster, and is transparent when a light is placed in the inside of it. It is minutely sculptured, within and without, with several hundred figures, which do not exceed two inches in height, and represent, as I suppose, the whole of the funeral procession and ceremonies relating to the deceased, &c. I cannot give an adequate idea of this beautiful and invaluable piece of antiquity, and can only say that nothing has been brought into Europe from Egypt that can be compared with it. The cover was not there; it had been taken out and broken into several pieces, which we found in digging before the first entrance. I may call this a fortunate day—one of the best perhaps of my life. I do not mean to say that fortune has made me rich, for I do not consider all rich men fortunate; but she has given me that satisfaction, that extreme pleasure, which wealth cannot purchase—the pleasure of discovering what has been long sought in vain.' The learned scholars who have attempted to unlock the meaning of its hieroglyphic carvings, very provokingly arrive at different interpretations; therefore the laity may be allowed to suppose that their true import has not yet been fathomed. When first brought to England, the sarcophagus, or cenotaph be it, was offered to the trustees of the British Museum for £2000, and when they declined the purchase, Sir John Soane eagerly paid the sum demanded.

Returning to the ground-floor of the museum, and entering the gallery under the dome, amongst the variety of things to attract attention, a fine cast from the Apollo Belvidere, 'the lord of the unerring bow,' and an excellent bust in white marble of Soane, by Chantrey, are conspicuous. Without pausing longer here to contemplate the tastefully-disposed vases, urns, and fragments of architectural decoration, or even the cast from Michael Angelo in the adjacent lobby, let us enter the breakfast-room, a small but beautiful apartment, lighted by a miniature dome. Here is a portrait of General Bonaparte, and another of the fallen emperor, painted at St Helena. Between them is a curiously-mounted pistol, chiefly of silver. It is said to have been taken by Peter the Great from the bey, commander of the Turkish army, at Azof, 1696, and presented by the Emperor Alexander to Napoleon at the treaty of Tilsit in 1807, who took it with him to St Helena, where he gave it to a French officer. A picture by Howard, R. A., of the contention between Oberon and Titania, in *Midsummer Night's Dream*, is characterised by his usual gaudy colouring. We proceed in the next place up stairs, but pause a moment at the foot to admire Flaxman's noble group of the Archangel Michael overcoming Satan—

Him long of old
Thou didst debar, and down from heaven cast
With all his army.

From this model a large group was cut in marble for Lord Egremont, which is now at Petworth. A little higher in the staircase is one of the pictures 'painted for the purpose of illustrating the dramatic works of Shakspeare, by the artists of Great Britain,' at the instance of Alderman Boydell, in which laudable employment all the great artists of the day, including Reynolds, Romney, Fuseli, and Northcote, were enlisted. This picture, by Durno, is of no great merit. The scene is from the *Merry Wives of Windsor*, where Falstaff, in women's clothes, is ejected from Ford's house. 'I like not when a woman has a great peard; I spy a great peard under her muffler.' Passing a recess, in which two pictures by Howard are enconced (the best point for viewing them is a few steps higher) we come to a small Mercury in bronze, by Giovanni de Bologna, in-

stinct with exquisite and characteristic grace, reminding us irresistibly of that

herald Mercury,
New lighted on a heaven-kissing hill,

which haunted the imagination of Hamlet. Beside it is a small model by Bailey, R. A., representing, with Miltonic beauty, our first parent extended on the earth after his fall, crushed by the oppression of inextinguishable guilt, and beseeching death, in his agony of grief, as the most gracious of boons—

On the ground,
Outstretched, he lay—on the cold ground—and oft
Cursed his creation, death as oft accused
Of tardy execution.

We then enter the south drawing-room, on the table in the centre of which is a series of medals, 140 in number, struck in France during the consulate and the reign of Napoleon. These medals were once in the possession of the Empress Josephine, having been selected for her by the Baron Denon. The ivory table and the four ivory chairs round it were formerly in Tippoo Saib's palace at Seringapatam. Two other curiosities in this room are worth mentioning—namely, Sir Christopher Wren's watch, the face of which is 'with centric and eccentric scribbled o'er'; and a piece of jewellery found amongst the royal baggage after the disastrous battle of Naseby. There are several of Flaxman's models in this apartment, and on the walls are drawings after Raphael's frescoes in the Vatican. In the next room, connected with the last by folding-doors, are several paintings by Eastlake, Hilton, and others, but they are very inferior specimens of the handicraft of these artists. There is, however, a good picture by J. M. W. Turner—Van Tromp's barge entering the Texel in 1645, painted before he adopted the plan of obscuring his design by throwing the prismatic colours upon his canvas. There is also a beautiful little scene of greenery by Ruysdael. The glazed cases under the window contain a collection of gems, cameos, intaglios, &c. part of which were formerly the property of an Italian archbishop; many of them are very beautiful. At the foot of the next flight of stairs is a bust by Flaxman of the prime minister Pitt, in which, though merely a head, the commanding attitude of the orator is apparent. In the recess half way up is a plaster cast from Flaxman's 'Shield of Achilles,' executed for George IV. at a cost of 2000 guineas. A second was also made for the king as a present to his brother the Duke of York, a third is at Lowther castle in Westmoreland, and a fourth belongs to the Duke of Northumberland. The artist endeavoured to display in material forms Homer's famous description in the Iliad—

Rich various artifices emblazoned the field;
Five ample plates the broad expanse compose,
And godlike labours on the surface rose.

'Round the border of the shield,' says Allan Cunningham, in describing this magnificent work of art, 'he first wrought the sea, in breadth about three fingers; wave follows wave in quiet undulation. He knew that a boisterous ocean would disturb the harmony of the rest of his work. On the central boss he has represented Apollo, or the Sun in his chariot; the horses seem starting forward, and the god bursting out in beauty to give light to the universe around. On the twelve celebrated scenes which fill that space in the shield between the ocean border and the central representation of the universe, he exhausted all his learning, and expended all his strength. We have the labours of commerce and agriculture, hunting, war, marriage, religious rites—all, in short, that makes up the circle of social existence. The figures are generally about six inches in height, and vary in relief from the smallest perceptible swell to half an inch. There is a convexity of six inches from the plane, and the whole contains not less than a hundred figures.' On the staircase are some casts from the antique, the originals of which are in the Vatican museum, and some bas-reliefs by Flaxman. Amongst a variety

of pictures and drawings in the room beyond, are Calcott's View of the Thames below Greenwich, the Smoking-Room at Chelsea Hospital by Jones, two drawings of landscape by Ruysdael, which formerly belonged to Louis XVI., and a sketch of a dog by Rubens. There is here also a cabinet, said to have been presented by Philip of Spain to Mary of England. The adjoining room contains numerous models, chiefly in cork, of the famous buildings of antiquity—such as the Temple of Venus at Baalbec, the Temple of Neptune at Palmyra, the ruins of Pompeii, and the temples at Paestum,

That stand between the mountains and the sea,
Awful memorials, but of whom we know not.

There are several objects of value and rarity preserved in this museum, which are not shown to strangers without special permission. Amongst them is the manuscript of Tasso's great poem, the Jerusalem Delivered; a Latin manuscript, embellished with exquisite miniatures by Giulio Clovio, famous for his works in this line—a book containing the Psalms, illuminated by him, was sold for a large sum at the Strawberry Hill sale—a missal of the fifteenth century, containing nearly a hundred miniatures by Lucas von Leyden and his scholars, very finely finished in the Dutch style, but in other respects much inferior to the productions of Clovio; the four first folio editions of Shakespeare, which belonged to John Philip Kemble, &c. &c.

We think we have now said enough to prove that the Soane Museum is a place of great interest and attraction, and that a few hours spent amongst its accumulated wealth will neither be unpleasantly nor unprofitably occupied. In truth, there are many single objects which would be quite sufficient to attract any lover of art or archaeology. It is scarcely necessary to name the Belzoni sarcophagus, the two series of Hogarths, the Canaletto, the Clovio illumination, and the Tasso manuscript, as belonging to this class.

Sir John Soane, to whom the public is indebted for assembling and preserving this collection at a great expense, was the son of a bricklayer. In his profession of an architect he acquired considerable fame, with wealth that enabled him to indulge his taste in accumulating rarities and works of art. He died in 1837, at the age of 84, having, a few years before his decease, obtained an act of parliament for settling and preserving his museum, library, and works of art for the benefit of the public, and for establishing a sufficient endowment for the maintenance of the same. Under this act the property was vested in a body of trustees, and the dividends of a sum of £30,000 stock are applied under their direction in its support. The curator, Mr George Bailey, resides at the museum, and all who have occasion to trouble him personally must thankfully acknowledge his attentive offices.

LUCY FENNEL.

A TALE OF HUMBLE HEROISM.

In a small village near the town of Honiton, in Devonshire, there lived a widow and her son. The old woman had, till her sight failed her, not only earned a sufficient livelihood, but had saved a little money, by making that kind of lace for the manufacture of which Honiton is so widely famed. When, from the infirmities of age, she could no longer ply her vocation successfully, it happened fortunately that her son, by his labour as a farm servant, was able to make up the deficiency. He was a fine, spirited young fellow, who went through his laborious occupations with a good-will and cheerfulness which was so satisfactory to his employer, that he determined to advance, whenever opportunities offered, so assiduous a servant and good a son.

Some two years before our story opens, it happened that a young woman, the daughter of a decayed farmer in the southern part of the county, came to superintend the dairy of Luke Damerel's master. It was not un-

natural that the buxom lass and the young man should form a mutual attachment. As they were both very well conducted persons, their love passages were looked upon with a favourable eye both by Dame Damerel and by the farmer's wife, Mrs Modbury, though neither openly sanctioned it, for prudence' sake. Luke and Lucy, however, loved on, as they thought, in secret, determining not to reveal their mutual affection till they should be placed in circumstances to get married. Things remained thus for more than a year and a half, when Farmer Modbury's wife died, and other circumstances occurred which induced him to promote Luke to a more lucrative and responsible situation on the farm. Shortly after the demise of his wife also, he found it expedient to give Lucy, in addition to her dairy duties, the sole charge of the housekeeping.

With the rise in his fortunes, Luke's thoughts were directed to the accomplishment of his dearest hope, and he revealed his passion to his mother, consulting her on the propriety of the step he wished to take; which was simply to marry Lucy, and bring her to live in the cottage. The old dame was not surprised at the proposal, for she expected it to be made from the day Luke's wages were increased. She had made up her mind what to advise, and did not shrink from advising it, although it would not be agreeable to her son. 'Luke,' she said, 'you must still wait. Your earnings are not sufficient to keep Lucy comfortably; and she, you know, would have to give up her place, which is now a good one. So you would not only be injuring yourself, but her also.'

Luke fired up at this, and unkindly hinted that his mother did not wish to have a companion to share their home. The old dame, though much hurt, denied that any such feeling swayed her, and advised him to consult Lucy herself. Dame Damerel had that confidence in the girl's good sense and prudence, that she was sure even Lucy would not consent to marry so soon as Luke wished.

In no very amiable mood the lover sought his mistress at the farm-house. He went into the kitchen, and not finding Lucy there, inquired of one of the maids where she was. With a sly ominous expression the girl replied 'that Miss Lucy was in the best parlour making tea for master.' This information gave poor Luke a sort of panic. He trembled, turned pale, and hastily retreated from the house. Discontented thoughts filled his mind. 'No doubt,' he said aloud, as he walked homewards—'no doubt she'll not consent when I propose to marry her, though I can keep her. Farmer Modbury will be a better match for her than a poor hard-working lad like me. But I'll see about that—it shall be now or never. If she won't marry me in a week, she never shall!' In truth, Luke had been feeling a pang of jealousy creep over him ever since Lucy was promoted to be Modbury's housekeeper; and that she should be admitted alone, with him into the best parlour to make his tea, confirmed what were previously only suspicions. On entering the cottage, his wild looks almost frightened his mother; but he was silent as to the cause, and went sullenly to bed.

Farmer Modbury kept up the good old Devonshire custom of dining with all the people in his employment; and the day after, when Luke with the rest of his companions sat at the table, he watched the actions and countenances of Lucy and her master, to catch new causes for the tormenting feeling which possessed him. The meal concluded, he followed the girl to the dairy, as was his custom; for a short and sweet interview could always be snatched at that time. The present one was, however, the reverse. In a hard tone of voice, and with an abrupt manner, Luke inquired if she were ready to have him? The girl frankly answered, 'Of course I am, Luke; but what should make you ask the question on such a sudden?'

Luke's jealousy was a little assuaged by Lucy's open and confiding manner, and becoming more calm, he told her his plans. 'It will never do, Luke,' she replied.

'Besides, my father, whom I must send to about it, would not consent. No, no, we must wait.'

'Wait! for what, I should like to know? To give master, I suppose, a chance of—of—'

'Of what, Luke?'

'Why,' said Luke, worked up into a sort of frenzy by the very thought—'why, of asking you to take poor dead-and-gone missus's place!'

The colour mounted to Lucy Fennel's face. She cast a reproachful look on her lover, and seemed ready to cry; but woman's pride came to her aid, and she left the dairy, as if afraid to hear another of Luke's terrible words. Had the young man not gone out immediately, he might have heard ill-suppressed sobs issuing from the room into which the maiden had shut herself. 'She is afraid to face me,' said Luke to himself as he crossed the courtyard. 'No, no, she can't deceive me, though she is trying.'

The directions Damerel gave to the workmen that afternoon were so injudicious, that his master happening to overhear him tell a ditcher to fill up a drain which ought to have been opened, gave him a severe reprimand. Luke received what was said with the worst feelings, continually repeating to himself, 'Ah, he has a spite against me now. He did not make that girl his housekeeper for nothing. I'm not wanted here, I can see.'

When work was over, it happened that as Luke was returning to his own cottage he met young Larkin, a neighbouring farmer's son, who asked him to accompany him to Honiton, where he was going to 'see the sodgers,' a regiment being about to pass through the town on its way to form part of Plymouth garrison. To beguile the care which tormented him, he gladly consented, and having gone home to put on his Sunday clothes, was soon equipped for the evening's expedition. The two friends had to pass Modbury's parlour window, and it was tea-time. Luke cast an inquisitive glance towards it, and trembled when he saw the blind being slowly pulled up. Presently it revealed the figure of Lucy, very nicely dressed with a new and handsome cap. Something having prevented the blind from being drawn quite to the top, Lucy mounted on the window-seat to adjust it, and when about to descend, Luke plainly saw his master come forward, give her one hand, while with the other he assisted her down by the waist! Damerel grasped the tree he was resting against for support; a film came over his eyes; but a few rough jokes from Larkin recovered him, and hearing the military band in the distance, he endeavoured to forget his cares, and trudged on towards Honiton.

Meanwhile, the moment Lucy had finished her duties at the tea-table, she hastened to Damerel's cottage, in the hope, not of seeing her lover, but his mother, alone. The old dame, perceiving her pale and in low spirits, thought she divined the cause, by supposing the girl was sorrowing at the imprudence of the step Luke had proposed to her. 'Well, well,' said the kind old woman, 'things may not be so bad after all, Lucy. And since Luke has set his heart so much upon it, and you, I am sure, are nothing loath, we must try and manage it. I'll tell you what I've been thinking, girl. You see the great mischief will be your being obliged to give up your place at the farm; now, I know a plan by which that loss may be mended. You are a quick, handy maid; and suppose—suppose—' and here the good old woman took Lucy's hands in hers—'suppose I teach you lace-making?'

These words poured a light into Lucy's heart which seemed to banish all her grief. The means of rendering herself independent of her present situation was all she wished for. She loved Luke tenderly, dearly, and with a fervent, virtuous desire, wished to become his wife. This wish had grown much stronger since her painful interview with him, not only because she wished to prove she was ready to sacrifice everything for his sake, but for another and more perplexing reason. Her master had paid her attentions that evening which

left no doubt on her mind that he desired her for his wife.

When Mrs Damerel heard the news, she was much distressed. 'Oh, it is too bad!' she exclaimed, 'to think that my Luke should be the means of preventing you from marrying so well—you who are worthy of any man.'

'Do not think of that; I could not be happy with one I do not love. So now, dear mother—for I will always call you so—let me hear what plan you propose.'

'Well, instead of talking idly, as we always do when you come to see us, you shall let me teach you the lace-making. Come every night, and in a month or two I shall be able to put you in a way to earn quite as much as you do now at Farmer Modbury's. When this is the case, we must see about getting yourself and Luke asked in church, for surely both your earnings put together will be enough to keep you comfortably.'

'But will not the farmer bear some enmity to poor Luke?'

'I will answer for him, girl. I have known him longer than he has known himself. I nursed him, and I can say with truth that a better hearted man does not live. Should he again offer you any civilities, tell him the whole truth, and I'll warrant he will not repeat them.'

That evening Lucy tripped home with a light heart. When she retired to rest, she built many an air-castle of future happiness.

The next morning, as the home-servants of Modbury's farm were going to their daily toil, they found a crowd round Damerel's cottage door. On inquiring into the cause, they were told that Luke had in a fit of despair enlisted as a soldier, and that the news had wrought so violently on the feelings of his mother, that it was thought she could never recover!

The scene inside the cottage was painfully distressing. The old dame was lying on a bed with her clothes still about her, showing that she had not gone to rest the whole night. The village doctor was by her side, having just bled her, whilst everything strewed about the room indicated that the always revolting operation had but recently been performed. The neighbours, as they crowded round the door, denounced Luke's conduct as rash and heartless. In the midst of their denunciations they were joined by another, to whom every word they uttered was as a death-wound. It was Lucy.

Whoever has had the misfortune of often seeing women placed in sudden difficulties, or overtaken by an unforeseen misfortune, must have remarked that they occasionally act with unexpected firmness. They frequently show a calmness of manner and a directness of purpose, forming quite an exception to their everyday demeanour. It is after the danger is over, or the first crisis past, that they break down, as it were, and show themselves to belong to the weaker sex. Thus it was with Lucy. When she entered the cottage, she had a full knowledge of the death-blow which had been inflicted on her hopes of future happiness. Still, she seemed calm and collected. When she took the basin from the surgeon to bathe Mrs Damerel's temples herself, her hand shook not, and she performed the kindly office as neatly as if no misfortune had befallen her. When she went to the door to intreat the neighbours to stand away from it, that sufficient air might be admitted into the room, her voice, though rather deeper in tone than usual, was calm and firm. Had she not occasionally pressed her hand tightly against her brow, as if to cool its burning agony, you would have thought that she suffered no further anxiety than that which is usually felt whilst attending the sick.

It was, however, when she was left alone with the exhausted, almost senseless mother, that the tide of grief took its full course. Lucy wept like one distraught. Through the deep, black future which lay before her, she could see no gleam of hope or sunlight. She unjustly upbraided herself for having, however innocently, given Luke cause of suspicion. The weight of blame which she took to herself was almost insup-

portable. 'I have been his ruin!' she exclaimed, burying her face in his mother's bosom.

When the old dame had strength to speak, she whispered Lucy not to give way, but to bear up against it. The past she wisely said was incurable; 'We must keep our senses whole for the future. While we keep heart, there is no fear of our seeing him again yet.'

The story reached Farmer Modbury as he was sitting down to breakfast. He was deeply shocked even when he knew no more than that Luke had enlisted; but when, on visiting the cottage, the whole truth was explained to him by Lucy, he felt both grief and disappointment. He was, however, determined not to abandon his suit as hopeless, and returning home, wrote to her father (he was a widower), explaining what had happened, and giving a frank exposition of his own honourable views as regarded Lucy. 'No doubt,' he concluded his epistle, 'she will soon forget this early and unhappy attachment.' Modbury was a shrewd man, and a clever farmer, but he knew very little about women's hearts.

From that day he was extremely kind and considerate to Lucy. Perceiving how much happier the girl was when she returned from visiting Mrs Damerel than at other times, Modbury diminished her labours by employing another dairymaid, so that Lucy might have more leisure, which he had no objection should be spent with the invalid.

One morning while Lucy was preparing the household dinner, a message arrived from the cottage. Her presence was desired there immediately. Lucy lost no time, and was soon in her accustomed seat at the bed-head. Mrs Damerel placed a letter in her hands. It was from her son. With beating heart Lucy opened it, and after time sufficient to master the emotions which the sight of Luke's handwriting caused her, she proceeded to read it aloud. It ran thus:—

'Maidstone Barracks, Kent.'

MY DEAREST MOTHER—I have at last found enough courage to take up my pen, hoping this will find you in good health, as it leaves me at present. I hope you have forgiven me for what I have done. I send you two pounds, part of the bounty I received for enlisting. Do not be afraid, my dear mother, that whilst I live you shall want.

When I went to Honiton, I was persuaded to enlist, after the soldiers had passed through, by a sergeant of a horse regiment, and I took the king's money; so I am now a private in the —th dragoons. I am rough-riding every day, and expect to be passed as fit for regular duty soon, when I shall be draughted off to the Indies, where our head-quarters are. I should be very comfortable if it was not for thinking about home so much. They have found out I am a good judge of horses, and know all about their complaints, so the sergeant-major told me yesterday I shall get on very well in the Indies, if I keep a sharp look out.

Dear mother, I shall see you again when I come back—I know I shall; and we shall be happy together; for now I have nobody else to care about upon the earth. I hope she will be happy, for she deserves all this world can afford, and I have always found Mr Modbury a kind master, so I am sure he will make her a kind husband. Dear mother, there is Tom Larkin, who promised me, after I had listed, that he and his sister Sarah would look in upon you sometimes, and help you. May God bless you, my dear mother. My heart was well nigh broken; but my comrades have been very kind to me, and I want for nothing. Good-by, mother, and believe me your ever affectionate son,
LUKE DAMEREL.

P.S.—I do not know when we shall sail for the Indies; but in case, please to direct to Private Damerel, —th Regiment, Light Dragoons, Maidstone, or elsewhere; and the letter will be sure to come to hand. Once more, God bless you, and may God bless her too, dear mother.'

To describe Lucy's feelings while she read this simply-

worded epistle would be impossible. All the love and tenderness which she had felt for Luke during the time she had known him, seemed to be concentrated within her at that moment. At first she mourned the step he had taken as hopeless and irreparable; but, casting her eyes upon the lace-work she had the day before been doing, a sudden thought seized her. By means of *that*, something might be eventually accomplished. With these thoughts she quietly folded the letter, placed it on the table beside the bed, and resumed the lace-work, scarcely speaking a word.

Mrs Damerel mistook this action for indifference, and in her sincere desire for the girl's welfare, urged—not for the first time—plans and sentiments which, though well meant, were utterly revolting to Lucy. Luke had, she argued, no doubt behaved very ill, by rashly and without explanation tearing himself not only from her, but from every person to whom he was dear. On the other hand Farmer Modbury's advances were very flattering, and she could hardly blame a girl who had been so cruelly treated, even by her own son, were she to accept the good fortune that lay before her.

Still Lucy went on practising her lace-work, her heart beating, and her averted eyes swimming with tears. At length she exclaimed, "Dame, you will break my heart if you ever talk in this way again. To you I look for comfort and strength in loving Luke, which I shall never cease to do. I, whether innocent or not, am the cause of depriving you of the comfort of his company, and I am determined to restore him to us both. You may think it impossible, but it is not. I have thought, and thought, and reckoned up everything, and am quite sure it can be done."

"I cannot make out what you mean?" said Mrs Damerel.

"Why, that I intend, as soon as I am able to do it well enough, to take work from the town, to leave Farmer Modbury, and come and be with you. We can live on very little, and every spare shilling we will put into the savings' bank, until it amounts to a sufficient sum to buy Luke off." She then industriously resumed her work. It was some time before Mrs Damerel could comprehend the full intent and meaning of the sacrifice the girl proposed. At first she thought it was a mere flighty resolution, that would not hold long; and even when she was made to understand that it was unshaken, she looked at the achievement as impossible; for at that time the prices for lace-work were falling, in consequence of the recent introduction of machinery.

About a week after this all her doubts vanished, for on Michaelmas day, when Lucy's term of service with Farmer Modbury expired, sure enough she brought her box, and declared she had come to stay with her adopted mother. She had previously been to a master manufacturer in Honiton with a specimen of her lace, and it was so well approved, that she obtained a commission for a large quantity on the spot. By this time the old dame had completely recovered from her illness, and was able to move about, so as to attend to the little domestic concerns of the cottage; Lucy could therefore give her undivided attention to her work.

Her proceedings were by no means agreeable to her father or to Modbury. The former wrote enjoining her by no means to leave the farmer's house; but the letter came too late, for she had already taken her departure. Modbury, however, in replying to an epistle in which Fennel had given him free consent to marry his daughter, expressed a thorough conviction of the firmness of the girl's purpose, and that at present it was impossible to shake it. Though she had left his roof, he should continue to watch over her, and hoped, by persevering kindness and attention, eventually to win her affections. Under these circumstances Lucy quietly established herself in Mrs Damerel's cottage.

At first she found it a hard matter to gain sufficient money for her labour to recompense the dame for her board and lodging, which she insisted upon doing every time she was paid by her employers. Still she wrought

on, although her savings were small, and at the end of several months they bore a hopeless proportion to the large sum which was required. But time seemed a small object to her: she looked forward to the end, and in it she saw such a world of reward and happiness, that no toil would be too much to arrive at it. She had answered Luke's letter with her own hand, assuring him of her unshaken attachment, in spite of all that had happened; but unfortunately he had sailed for India, and it was sent thither after him, in obedience to the vague 'elsewhere' which had been added to the superscription according to his wish.

Slow progress was not the only trouble Lucy had to contend with. Modbury's attentions pained her as much as Luke's absence; the more so because they were so full of consideration for her welfare. She knew she never could return his kindness, and felt that she did not deserve it. She often told Dame Damerel that a show of hostility from the worthy farmer would not have pained her so much as his unremitting attentions.

Then, when the neighbours came in to gossip, they sometimes spoke against Luke. They would tell her that a man who would suspect her on such slight grounds, and act as he did, could never be true to her; that he would see some other whom he would prefer, and some day send home word that he was married; neither was it likely that he would ever come home alive from the Indies. These poisoned arrows, which were meant as comfort, glanced harmlessly from Lucy, who was invulnerably shielded by trusting love and hope. She would answer 'very likely,' or 'it may be,' or 'there is no knowing what may happen in this world of trouble,' and still rattle about her lace-pegs over the pillow on which it was made with the quickness of magic. Amongst her visitors, however, there were two who invariably offered her better consolation; these were Larkin and his sister. Tom 'stuck up,' as he expressed it, for his friend Luke, and always put the blame of the enlistment on the wiles and arts of the recruiting sergeant, who regularly entrapped him into the deed. Many a happy winter evening was spent in that humble cottage by Lucy and her friends. Luke was never forgotten in their conversations; for there was the lace which was being unweariedly made for his release to remind them of him. When Modbury made his appearance (and this was very often), the subject was of course dropped.

A year passed away. Neither Lucy nor Modbury had made much progress in their several aims; scarcely a tithe of the requisite sum for Luke's discharge had been saved; neither could Modbury perceive that his suit advanced. Lucy's conduct sorely perplexed him. She always seemed delighted when he came in, and received him with every mark of cordiality; but whenever he dropped the slightest plea in his own behalf, tears would come into her eyes, and she intreated him to desist. He began to remark also, that besides the presence of the old dame, which was surely a sufficient safeguard against any warmth of manner he might be betrayed into, Lucy always contrived to have Susan Larkin with her. Should she be absent, Lucy would be telling Modbury what a good, industrious, excellent girl she was; which, indeed, was the truth.

No letter came from Luke, and there was no proof that he had received hers. Lucy began gradually to despond; for work became slack, and at times she only got enough to employ her half the day. Not to lose ground, however, she hired herself to the neighbouring farmers' wives to sew during her spare time, leaving Dame Damerel to the occasional care of Susan Larkin. While she was sitting at work during one of these engagements, she compared her own cheerless lot with the happiness which surrounded her. The farmer was reading the newspaper, his wife and daughter assisting her in the work she was doing. As she made this comparison, and thought of Luke, banished as it were from his home, and enduring perhaps severe hardships, she could scarcely refrain from weeping.

Now and then the farmer read a paragraph from the paper, and presently exclaimed—'Ah, our young squire has got safe to his regiment in India.' At these words Lucy trembled, but went on rapidly with her work, lest her emotion should be noticed. She had previously heard that the son of a neighbouring proprietor had bought a commission in Luke's regiment, and this was almost like having news of Luke himself. Presently the reader went on with the paragraph—'We understand there has been a fatal disease which has carried off many of the—' The farmer made a pause here, and Lucy's heart sank within her. 'Oh, I see,' the old gentleman ejaculated; 'the corner is turned down'—'has carried off many'—yes—'many of the—horses.'

This little incident produced such strong emotions in Lucy's frame, that though she felt, upon the whole, much gratified by merely hearing about Luke's regiment and its horses, yet she became too ill to proceed with her work, and found it necessary to return to the cottage.

Lucy soon altered her plan of engaging herself out; for the idea struck her, that if she were to make lace on a sort of speculation, and keep it by her till it was wanted, she would in the end make a greater profit. Having, when her father was in good circumstances, been partly educated at an Exeter boarding-school, she had acquired there some knowledge of drawing, and by exercising her pencil, she now invented some very pretty lace patterns.

Lucy wrought and hoped on for another year. Still nothing was heard from Luke. A new calamity had fallen upon Lucy. Her father, a broken and decayed man, had come to live near her, and was now nearly dependent on her for support. Both Modbury and Farmer Larkin gave him little jobs to do, for which they liberally recompensed him. The quantity of lace Lucy was employed to make was so small, that it just sufficed to keep her and her father; while her little capital, instead of increasing, was gradually absorbed by the purchase of materials for the stock her industry accumulated. Susan Larkin frequently visited her, and Modbury was seldom absent.

No ill fortune seemed to depress the persevering girl. Even though she was working almost night and day, she still kept up her spirits. Indeed, at every new misfortune, a fresh accession of firmness and resolution seemed to nerve her. About this time her father died, invoking blessings on her for having been so good a daughter. After the first shock of grief had passed, she continued her task amidst the most hopeless circumstances. The lace-trade sunk lower and lower; still Lucy wrought on, under a strong presentiment that it would improve. She did not relax one hour's labour, although she was now receiving much less for it than when she began. She accumulated so large a stock, that at last every shilling of her savings was spent for materials. In exchange, however, she possessed a large quantity of beautiful lace, that even, if it sold at the present low prices, would have yielded a small profit. At last things became so bad, that a sale seemed unavoidable, disadvantageous as it might be. Lucy, now an object of commiseration amongst the neighbours, still retained her cheerfulness. That so much patience, modesty, and firmness of purpose should not meet its reward, seemed almost impossible; and fortune smiled on Lucy when nearly every hope seemed to have left her.

It is well known by what trifles in the mercantile world fortunes are lost and won. The detention of a ship, the non-arrival of a mail, has ruined hundreds; whilst some equally unforeseen caprice of fashion or similar accident has made as many fortunes. It happened, when Lucy had the greatest cause for despondency, that within a short period two members of the royal family died. Mourning lace was then much in request, and it happened that most of Lucy's stock was of that kind. Suddenly, commissions from Honiton flowed in, and Lucy was kept constantly at work, at

wages much higher than before—her own stock acquiring fresh value while the price continued to rise. Young Larkin, who was a shrewd fellow, advised her to 'hold' it till the value increased still more. She took the advice, and at the proper moment sold it at a price she never hoped to realise. At the end of a week she found herself in possession of a sum which was, within a few pounds, sufficient to procure her lover's discharge from the army!

Poor Lucy could hardly believe her eyes when the manufacturer laid down the bank-notes before her. She pinned them carefully into the bosom of her frock, and hastened to tell Dame Damerel that all their troubles were over. The old woman's eyes glistened as Lucy unpinned her treasure and laid it on the table. It was counted, re-counted, and wondered over. What was to be done with it till the rest was procured? Who would take care of it?

This delight was, however, somewhat damped when they came to consider that, putting aside all uncertainty about his fate, it would be at least six months before Luke's discharge could reach him; then an additional half year would elapse ere he could get back. It was a long time to wait. 'Never mind, dear mother,' said Lucy, 'the time that has passed since he left seems scarcely a year, although it is three. It is only because the twelvemonth is to come that it appears to be so long. Still,' she said, considering and heaving a deep sigh, 'we have not got his discharge yet, and great as this sum is, some more must be earned to make up the rest.'

'Leave that to me,' returned Mrs Damerel.

Next day, when Lucy returned from the post-office, where she had taken a letter for Luke, she found another lying on the table in Larkin's handwriting. On reading the superscription, she found it was addressed to the war-office. 'Yes,' said Mrs Damerel in answer to her inquiring glances, 'it is all done now, Lucy; and this letter is to be sent off to tell the great people that we can have the money ready to buy our dear Luke off again.'

Larkin had, in truth, gladly supplied the small sum which was deficient. The letter was sent, and in less than a week an immense despatch found its way to the village, which excited universal wonderment. It was a great oblong missive, with the words 'On his majesty's service' printed at the top. It had an enormous seal, and was directed to 'Mr Thomas Larkin.' A crowd of idlers followed the postman with this epistolary phenomenon, in the hope of getting some knowledge of its contents. Tom, however, when he read it, coolly put it into his pocket, and walked to the cottage without saying a word to anybody.

This letter seemed like a climax to Lucy's good fortune, and 'begged to inform Mr Larkin that Corporal Farrier Damerel was on his way to England to superintend the selection of troop horses, and that his discharge should be made out when he had arrived and performed that duty.'

Scarcely a month after the arrival of the official despatch, a corporal of dragoons was seen trespassing on Farmer Modbury's fields, by crossing them in great haste without any regard to the footpaths. An old ploughman roughly warned him off, threatening personal ejection. 'What, Roger Dart?' exclaimed the soldier, 'is this the way you welcome a man home after a long absence!' The ploughman stared, and said he did not know him. 'Do you know,' rejoined the corporal with a trembling voice and anxious countenance—'do you know Lucy Fennel?'

'Of course I do,' returned Roger; 'everybody knows her, and, if I may make so bold, loves her too! Why, sure enough, there she is sitting—don't you see?—there, sitting at Dame Damerel's door making lace for the life of her.'

The stranger flew across the field, and the ploughman saw him bound over the hedge, take Lucy into his arms, and drag her, bewildered and enraptured, into the

cottage. 'Why, dang me if it bea'n't Luke Damerel!' exclaimed the rustic, slapping the thighs of his leather breeches; 'how main glad the folks will be to see 'un!—I know what I'll do.' Whereupon Roger trudged across the fields towards the church. He happened to be one of the parish ringers, and calling his mates from the fields, they all trudged off to the bell-tower, and rang out as merry a peal as ever was heard. The whole country was in a commotion; the news ran like wildfire from lip to lip and ear to ear, till the cottage was beset with visitors within and without. But Luke heard no welcome, felt no grasp, but that of Lucy and his mother. As to Lucy, an intense happiness thrilled through her, which absorbed all her faculties, except that of feeling the full extent of her bliss.

This story of patience, endurance, and faith in humble life is almost ended. Luke's furlough only extended to a week, which he spent as an inmate of the farm, at Molbury's earnest intreaty; for he now gave up all hope of Lucy, and determined to help in rewarding her patience by promoting the match with his rival. At the end of that time Luke was obliged to depart for Yorkshire, to meet the veterinary surgeon and purchase horses, in which he was found of the utmost use; but this, together with his excellent character, operated most unfavourably for his discharge. The authorities were unwilling to lose so good a soldier. The interest of the 'squire,' however, whose son was a cornet in Luke's troop, was set to work, the hard-earned money paid, and the discharge obtained. Damerel got a farm let to him on advantageous terms, close to his native village, and was married amidst more noisy demonstrations by Roger and his company of ringers. Modbury had taken to wife Lucy's friend, Susan Larkin.

The last time I was in Devonshire I called on Mr and Mrs Damerel. They are an interesting old couple, who have brought up a large family in comfort and respectability.

THE POSITION OF LITERARY MEN.

Mrs S. C. HALL, in a short paper in the *Art-Union*, on recently deceased men of genius, speaks a few poignant words respecting the condition of the literary labourer in this country. Mr Laman Blanchard perished in the most miserable manner at forty-one, for want of a kind friend to enable him to take that rest which was required for his overwrought brain. Thomas Hood, during his last illness, was obliged to 'write wit while propped by pillows,' and produced the chapters of an unfinished novel 'between the intervals and beatings of heart disease.' Well may Mrs Hall add, 'Alas, what do those endure who write for bread!' The fact of these two men—men of amiable, virtuous, and even prudent conduct—dying in the prime of life, without having been able to raise themselves above the pressure of immediate want, or make any provision for their families, is calculated to awaken a strong feeling respecting the position of literary men generally. Can it be quite right that, while commerce rewards its votaries so handsomely, the man of superior mind, if he chooses to obey its impulse to the gratification and instruction of his fellow-creatures, is almost sure of a life of mean struggles, a premature death, and the rendition of his widow and children into the mercy of the charitable? The proportion of service to the general cause surely demands some other distribution of the general wealth. Yet how is such a change to be, even in the slightest degree, effected? The arrangement established in society for the reward of all its industrious members is, that they receive a price for *what they have to sell*. The author endeavours to take advantage of the plan by throwing the productions of his brain into the form of books. But the lucrativeness of books is a matter of perfect accident, and nearly altogether irrespective of their utility to the public. There is nothing like an assurance, but rather the reverse, that a literary work of great excellence and originality shall be well

rewarded in this manner. The most exquisite short poem, on which the world is to hang delighted for ever, and which is to make for its author an undying reputation, will bring only a few pounds from a magazine at the most; a meritorious history, costing years of labour, will be ten before the public without returning one penny to the writer; while novels that only serve to amuse the passing hour, or compilations of no merit but that of being adroitly addressed to a public need, will be comparatively well remunerated. There was a great noise a few years ago about extension of copyright, as favourable to the interests of authors; but if one in a thousand ever receive benefit from it, it will be a wonder. Even of successful books, except in a few brilliant instances, the profits are little, compared with the gains of successful business. The author, unlike the man of trade, can depute no share of his work. He cannot profit by those huge combinations of the labour of others which make the factory man a kind of baron among his retainers. He must work out the whole for himself; and, after all, if he can induce a bookseller to publish for him, taking the one half of the profits for the risk attending all literary speculations, he is considered as well off. Thus it is that the author, while in society a prominent and important being far beyond most traders and factors, cannot live on a level with even the mediocre of that class, cannot indeed emerge for a moment from a humble obscurity, without the greatest danger. He can hardly return a cup of tea for the profuse dinner to which the shopkeeper invites him, except at the hazard of degrading embarrassments. Society brings him forward for its own gratification, or from a sense that he deserves a high social place; but when it hears that he has been tempted by the common and natural wish to reciprocate civilities with it, and has fallen into pecuniary difficulties in consequence, it condemns him mercilessly, according to the prevalent rule in this country with regard to everything in the form of debt. In short, the fate of a literary man chancing to have the extraordinary prudential gifts that would be required of him, and having nothing beyond his pen to look to, is—there is no disguising the fact—a cottage or a garret. He is condemned to personal obscurity or the most profound shade, while nominally blazing in the light of day. Could there be a greater anomaly? We expect the self-denial of those rare beings—the Cincinnatuses, the Dentatuses, the Andrew Marvels—from a large class, living unavoidably in a constant exposure to the temptations of the most luxurious community on earth. It is the merest silliness to look for such fruit from such circumstances. We may deplore, we may often see special reason to condemn, but we must also be fully sensible that the arrangements made by society for the remuneration and sustenance of authors are, in the first place, blameable, and that, while human nature is what it is, we have no title to hope that these men, as a class, will ever be greatly different from what they are.

The utter falsity of the position of the literary class is shown by one painful fact, that the booksellers, the men who are most connected with them in business, have universally, in London at least, a low opinion of them. It is one of the facts never told in print, but everywhere heard in private, that the literary men residing in the metropolis are generally regarded by their publishers with the utmost degree of distrust. To show how truly this is the case, we shall relate a little anecdote. A publisher of high standing said one day to his head clerk, 'Why, there is — [mentioning the name of a retail bookseller who had been in business for some time, but who was also a writer of books]; he seems to be doing well. I think we might subscribe with him'—[that is, let him have new books upon an open account]. 'Oh, sir,' said the official, with a hard knowing look, but in the simplest earnest, 'don't you know? He's an author.' 'Oh,' said the other; 'to be sure he is. I had quite forgot.' No more was said, because it was understood that, as a matter of

course, the man's being an author was a proof of his not being entitled to credit. We cannot believe, no one having any faith in human nature can believe, that it is natural and unavoidable for the highest intellects to be deficient in *morale*; it must be mainly the effect of erroneous circumstances pressing unduly on those minds.

The unsoundness is manifest. What is to be the cure? Unfortunately, in England, all remedies for great public evils are Utopian. We therefore suggest none, but leave the evil, for the meantime, to be digested in the public mind.

DYSPEPSIA.

A DARKLY poetical notion was current amongst our forefathers, that a person of a morose, unamiable disposition was possessed of a devil. They believed that he was merely the outer casing, the sheep's clothing of a sort of supernatural wolf; that if the visible shell, in the likeness of man, could be removed, there would appear to the terrified visions of the multitude a figure with horns, hoofs, a tail, and the very sharp goad with which it was supposed to prick on its victim to say spiteful things, and to do bad actions. This idea of our forefathers has been proved by anatomy and physiology (of which they knew nothing) to be quite erroneous as far as regards the bodily presence of the evil spirit. Science has robbed us of the horns, the hoofs, and the tail; but it has, with all its poetry-spoiling discoveries, still left us the essential demon. The monster is called by nosologists '*dyspepsia*,' and by the rest of the world indigestion.

Many a snappish, disagreeable man, who is feared at home as a domestic tyrant, shunned abroad as a social Tartar, and denounced everywhere as the wilful incarnation of ill-temper, is nothing more than the victim of the demon dyspepsia. Perhaps he was in his early years as good-humoured and kind a being as ever breathed. Gradually, his friends and relations perceived a change in his disposition. This began, in all probability, by snappishness to his wife, scolding his children, and occasionally kicking his dog. When expostulated with for allowing these causeless improprieties to grow upon him, he is ready enough to own his faults, but at the same time equally ready to make excuses for them. He declares business is going wrong, though you know it never prospered better; or that his children worry him, though it is evident he has terrified them into taciturnity and shrinking obedience. He makes every excuse but the right one; because, poor wretch, he is perfectly ignorant of the real cause. He really believes what he says, and thinks that he is on the road to the bankrupt court, and that his offspring really are disobedient. Alas! it is one of the characteristics of the insidious demon he is possessed with to hide itself from the ken of its victim. Even when the monster deranges his bodily health, and drives him to the doctor, he describes every symptom but those which are indicative of the real disease. The skilful physician, however, finds it out in spite of, or rather in consequence of, his mystifications, and proceeds to exorcise the evil spirit—not after the ancient plan with bell, book, and candle—but with pill, draught, and plenty of exercise.

When, therefore, we meet with such a man as we have described, let us be a little charitable. Don't let us denounce him without remorse or mitigation. Pity is the proper sentiment which he should awaken. Human nature is not so innately vicious as some philosophers imagine; instinctively, our good impulses predominate, and would remain dominant, were they not so often blunted, checked, and strangled by dyspepsia. Imagine yourself in a dyspeptic condition, and then ask whether you could be amiable to your fellow-creatures, or be able to assume that virtue when you have it not? Fancy yourself in a state which, when asked about it, you are obliged to describe as a something which makes you wretchedly uncomfortable, but you don't know what;

a condition which, nevertheless, unfits you for occupation; a feeling which imparts a distressing craving for food, combined with a disgust at the very idea of eating it; a constant drowsiness, without the power of sleeping; a sensation of overwhelming fatigue and weariness, with a longing to take exercise; a weight over the brow, a weight at each joint, a weight at every extremity, and a still greater weight in the stomach. Then as to the state of your nerves: conceive yourself in the lowest of low spirits; in hourly dread of some misfortune; haunted with suspicions concerning your dearest friends; looking upon your whole household as a set of conspirators against your comfort: feeling all this, I say, with a thorough conviction that such sensations mislead you; that in reality no misfortune impends; and that your family love you dearly. Then at night, instead of enjoying the benefit of

* Nature's sweet restorer, balmy sleep,*

you are visited by your attendant demon's terrible ally, nightmare, who inflicts even greater tortures on you than his day-time colleague. 'In a half-waking or intersomnious condition,' saith the learned Dr Von Druffel of Berlin, 'you behold a monster of some kind—a goblin, a fiery horse, a wild gigantic man—glide slowly towards you. This apparition seats itself on the pit of your stomach, and presses you with such a crushing weight, that you can neither breathe nor move a limb.' You are not asleep; you are sufficiently awake to know that could you but move your little finger the charm would be broken, and the vile nightmare gallop away. But you cannot: all power is removed, and there the imaginary quadruped remains, caprioling upon your devoted breast like a heavily-shod war-horse on parade. Even when you fall asleep you are no better off. You have horrid visions. You dream yourself to be the most detestable villain in existence. In the short space of an hour's nap, you inflict tortures on some dear friend which would have frightened a Spanish inquisitor. You commit crimes of unheard-of atrocity, and only escape the gibbet by waking, the victim of remorse and despair.

After enduring all this, picture yourself seated at breakfast, and though surrounded with every comfort administered by a most affectionate household, just say whether you think it to be within the pale of human probability that you could look, speak, or behave pleasantly? If your wife were to offer you the sincerest sympathy, and the tenderest condolences, would not the internal demon '*dyspepsia*' incite you to accuse her of '*teasing*' you? Can you for a moment believe that, in such a state of mind and stomach, your expostulation would be mild and Christian-like, if the butter were bad, or the egg you had just broken somewhat too odoriferous? Would you, if ever so coaxingly asked, hand over a cheque for your wife's milliner's bill without grumbling? If you could do all these things, you are more than mortal.

Let me repeat, therefore, when you hear an individual denounced as a monster of ill-humour, do not be too harsh upon his moral character before you have inquired into his physical symptoms. Many a man who is accused of having a bad heart, ought rather to be described as having a bad stomach, for the immense influence which that organ exercises over the worldly conduct of mankind is greatly overlooked. A female patient of the celebrated French physician Pinel, who was fully possessed with the demon dyspepsia, and knew it, thus details her condition:—'The foundation of all my misfortunes is in my stomach. It is so sensitive, that pain, grief, pleasure, and, in a word, all sorts of moral affections, seem to take their origin in it. Even a frown from a friend wounds me so sensibly, that my whole system is disagreeably affected by it. I think by means of my stomach, if I may be allowed so to express myself.' How many apparently evil-disposed persons whom one meets with may be precisely in this lady's condition, and think and act from the dictates of the stomach, or rather from those of the demon contained

in it—dyspepsia! How frequently, therefore, may not our judgment err in the matter of first causes regarding petty cruelties and small tyrannies? When, for example, a rich debtor refuses a poor creditor a long-deferred payment, may not this piece of injustice be the result, not so much of sheer dishonesty, as of deranged digestive organs? May we not attribute it less to a defect in the moral sentiments, than to evil influences diffused over his nervous system by a piece of undigested pigeon-pie? I knew a whole family whose happiness seemed to depend upon what the head of it ate for dinner. His dietary was watched, especially by the younger branches, with incessant anxiety. After mutton-chops and boiled rice, they could—providing he abstained from pudding—coax papa out of anything. Boiled beef boded evil; and in that case they cared very little to come in as usual to take their share of dessert. When lobster-salad had been partaken of, they crept about the house like mice, and kept as much as possible out of papa's way. During his paroxysms of ill-humour, reasoning was vain; neither the expostulations of his brother the rector, nor the kind intreaties of a wife whom he devotedly loved, were effectual in restraining his tetchy ebullitions of spleen. The demon within grew daily more influential, till he began to be shunned by his friends. No good effect was produced even by that. At length a medical adviser was consulted respecting his cadaverous appearance and certain pains which 'shot' across the shoulders. The doctor ordered him to Cheltenham, placed him on a strict regimen, enjoined frequent visits to the pump-room, and in three months our friend returned, to all appearance an angel of good temper. The banished roses returned to his cheeks—he felt strong and hearty, and never spoke a cross word. His meals were no longer watched, for the juveniles found him ever kind and complying, no matter what was for dinner. It was, however, observed that he ate much more sparingly than formerly, and never would allow such a thing as a round of salt beef or a lobster to enter his door.

It is not too much to affirm, that half the crimes to which human frailty is liable are concocted in the stomach. The poor are incited to mischief by the cravings of their digestive organs for something to do; whilst the rich are often impelled to wrong, because they give their digestive powers more than they can do. If the former could keep fuller stomachs, and the latter emptier ones, there would assuredly be fewer evil deeds in the world than are perpetrated at present.

THE FUEGIANS.

SEPARATED from the mainland of South America by the narrow Strait of Magellan, and extending southward for several hundred miles to Cape Horn, lies the Archipelago of Terra del Fuego. This name, literally signifying Land of Fire, was given to it by the early Spanish navigators, from the appearance which the whole coast presented of recent volcanic action. Subsequent voyagers, however, have been unable to detect any lava, pumice, obsidian, or other volcanic product, but have found the prevalent rock to be a trachytic trap, thus carrying us back to the geological epoch which gave birth to the Alps, Apennines, and crateriform hills of Auvergne. The group consists of one large island, four others of moderate extent, and a great number of rocky islets and reefs—the area of the whole being perhaps not less than that of Great Britain. The larger island, which forms the eastern and north-eastern portion, and occupies considerably more than half of the entire superficies, is generally known as King Charles's Southland; the four minor islands, which lie to the south and west, are Navarin, Hoste, South Desolation, and Clarence.

The physical aspect of the Archipelago is mountainous, rugged, and barren—consisting of a succession of hills and valleys, precipices and ravines. The shores are indented by deep but narrow arms of the sea, on whose

sides rise the mountains to an elevation of from 2000 to 3000 feet—the highest being Sarmiento, on the west coast of Charles's Southland, and which attains the altitude of 6000 feet. During the greater part of the year the summits of the mountains are covered with snow—the snow line in that region being found so low as 3500 feet. This, together with the heavy rains which generally prevail, and the absence of sheltering forests, gives to the country a cold and inhospitable aspect. It must not be supposed, however, that the whole comes absolutely under this description, for the western district of the great island consists of a plain studded with a number of low hills, which are clothed with dwarf trees and creeping evergreens—the level grounds yielding a harsh dry grass, on which feed large flocks of the guanaco, or wild alpaca.

The climate of Terra del Fuego is much colder than that of North Britain, though both are respectively situated at about the same distance from the antarctic and arctic circles. 'The difference,' says one authority, 'is perhaps best indicated by the different elevations at which the snow line occurs. In North Britain, it is supposed to be at an elevation of 5000 feet; but in Terra del Fuego, it occurs between 3000 and 3500 feet. The climate of Bergen, in Norway, is perhaps very similar to that of Terra del Fuego, where, as at Bergen, cloudy weather, rain, and wind, prevail throughout the year, and fine days are very rare. No season is quite free from frost: the thermometer, even in February, which corresponds to our August, descends occasionally some degrees below the freezing point; though during the winter the mean temperature is said to be $2\frac{1}{2}$ degrees above that point. It seems that this peculiarity of the climate is to be attributed to the high temperature of the sea, which at its surface is never lower than 45 degrees Fahrenheit, especially in the Straits of Magellan, where the observations were made. The coasts that are exposed to the influence of the open ocean have probably a much colder climate, as during the winter they are surrounded by large fields of ice, which at that season occur as far north as 54 degrees south latitude, along the coast of King Charles's Southland. The level portion of that island suffers rather from want than from abundance of moisture, like the eastern coast of Patagonia.' This plain, indeed, is the only district that presents a habitable aspect; though, from the unsteadiness of the climate, it is very questionable if any agricultural operations could succeed.

Respecting the natural productions of the group very little is known. The United States Expedition found the lower hills covered with dense forests of beech, birch, willow, and winter-bark, but none fit for timber, the trees being not more than forty feet in extreme height. All of them had their tops bent to the north-east by the prevailing south-west winds, and looked at a distance more like heath than forest trees. Dry harsh grasses are prevalent in the lower valleys, among which occur the far-famed tussack so characteristic of the Falkland Islands; and plenty of scurvy-grass and wild celery were found close to the beach. The shores abound in fish and shell-fish; numbers of sea-fowl visit them periodically; and at certain seasons shoals of the humpback whale crowd the surrounding seas. The guanaco is the only land animal of importance; but the natives do not seem capable either of entrapping it for food or for domestication, though it might be as servicable to them in these respects as the llama to the Peruvians, or the rein-deer to the Esquimaux. Such are the natural features of this distant region, which, however uninviting, is not without its share of the human race, respecting whom we are enabled to glean some information from the recently published account of the United States Exploring Expedition under Captain Wilkes.

The natives belong to the Petcheree or Yacanacu tribe of Indians, a very scanty race, who are confined to the group and some of the adjacent portions of the continental coast. They lead a miserable life, only to be

compared with that of some of the native Australians; they live on shell-fish, and squat themselves in places where these are found most abundantly, moving their habitations only when the supply is exhausted. 'During our stay,' says Captain Wilkes, 'we had at various times visits from the natives. They were all at first very shy, but after they found our friendly disposition towards them, they became more sociable and confiding. Before our departure from Orange Harbour, a bark canoe came alongside with an Indian, his squaw, and four children. They were entirely naked, with the exception of a small piece of seal-skin, only sufficient to cover one shoulder, and which is generally worn on the side from which the wind blows, affording them some little shelter against its piercing influence.

'The Petcherees are not more than five feet high, of a light copper colour, which is much concealed by smut and dirt, particularly on their faces, which they mark vertically with charcoal. They have short faces, narrow foreheads, and high cheek-bones. Their eyes are small, and usually black, the upper eyelids in the inner corner overlapping the under one, and bear a strong resemblance to those of the Chinese. Their nose is broad and flat, with wide-spread nostrils, mouth large, teeth white, large, and regular. The hair is long, lank, and black, hanging over the face, and is covered with white ashes, which gives them a hideous appearance. The whole face is compressed. Their bodies are remarkable, from the great development of the chest, shoulders, and vertebral column; their arms are long, and out of proportion; their legs small, and ill-made. There is, in fact, little difference between the size of the ankle and leg; and when standing, the skin at the knee hangs in a large loose fold. In some, the muscles of the leg appear almost wanting, and possess very little strength. This want of development in the muscles of the leg is owing to their constant sitting posture, both in their huts and canoes. Their skin is sensibly colder than ours. It is impossible to fancy anything in human nature more filthy. They are an ill-shapen and ugly race. They have little or no idea of the relative value of articles, even of those that one would suppose were of the utmost use to them, such as iron and glass-ware. A glass bottle broken into pieces is valued as much as a knife. Red flannel, torn into strips, pleases them more than in the piece; they wound it around their heads as a kind of turban; and it was amusing to see their satisfaction at this small acquisition.

'The children were quite small, and nestled in the bottom of the canoe on some dry grass. The woman and eldest boy paddled the canoe, the man being employed to bail out the water and attend to the fire, which is always carried in the bottom of the canoe, on a few stones and ashes, which the water surrounds.

'Their canoes are constructed of bark, are very frail, and sewed with shreds of whalebone, seal-skin, and twigs. They are sharp at both ends, and are kept in shape, as well as strengthened, by a number of stretchers lashed to the gunwale. These Indians seldom venture outside the kelp, by the aid of which they pull themselves along; and their paddles are so small, as to be of little use in propelling their canoes, unless it is calm. Some of the officers thought they recognised a party on the Hermit Islands that had been on board ship at Orange Harbour. If this was the case, they must have ventured across the Bay of Nassau, a distance of some ten or twelve miles. This, if correct, would go to prove that there is more intercourse among them than their frail barks would lead one to expect.

'Their huts are generally found built close to the shore, at the head of some small bay, in a secluded spot, and sheltered from the prevailing winds. They are built of boughs or small trees, stuck in the earth, and brought together at the top, where they are firmly bound by bark, sedge, and twigs. Smaller branches are then interlaced, forming a tolerably compact wicker-work, and on this grass, turf, and bark are laid, making the hut quite warm, and impervious to the wind and snow,

though not quite so to the rain. The usual dimensions of these huts are seven or eight feet in diameter, and about four or five feet in height. They have an oval hole to creep in at. The fire is built in a small excavation in the middle of the hut. The floor is of clay, which has the appearance of having been well kneaded. The usual accompaniment of a hut is a conical pile of shells opposite the door, nearly as large as the hut itself. Their occupancy of a hut seems to be limited to the supply of shell-fish, consisting of mussels and limpets, in the neighbourhood.

'These natives are never seen but in their huts or canoes. The impediments to their communication by land are great, growing out of the mountainous and rocky character of the country, intersected with inlets deep and impassable, and in most places bounded by abrupt precipices, together with a soil which may be termed a quagmire, on which it is difficult to walk. This prevails on the hills as well as in the plains and valleys. The impenetrable nature of the forest, with the dense undergrowth of thorny bushes, renders it impossible for them to overcome or contend with these difficulties. They appear to live in families, and not in tribes, and do not seem to acknowledge any chief.

'On the 11th of March three bark canoes arrived, containing four men, four women, a girl about sixteen years old, four little boys, and four infants, one of the latter about a week old, and quite naked. The thermometer was at 46 degrees Fahrenheit. They had rude weapons; namely, alings to throw stones, three rude spears pointed at the end with bone, and notched on one side with barbed teeth. With this they catch their fish, which are in great quantities among the kelp. Two of the natives were induced to come on board, after they had been alongside for upwards of an hour, and received many presents, for which they gave their spears, a dog, and some of their rude native trinkets. They did not show or express surprise at anything on board, except when seeing one of the carpenters engaged in boring a hole with a screw-angur through a plank, which would have been a long task for them. They were very talkative, smiling when spoken to, and often bursting into loud laughter, but instantly settling into their natural serious and sober cast.

'They were found to be great mimics, both in gesture and sound, and would repeat any word of our language with great correctness of pronunciation. Their imitations of sounds were truly astonishing. One of them ascended and descended the octave perfectly, following the sounds of the violin correctly. It was then found he could sound the common chords, and follow through the semitone scale with scarcely an error. They have all musical voices, speak in the note G sharp, ending with the semitone A, when asking for presents, and were continually singing.

'Their mimicry became annoying, and precluded our getting at any of their words or ideas. It not only extended to words or sounds, but actions also, and was at times truly ridiculous. The usual manner for interrogating for names was quite unsuccessful. On pointing to the nose, for instance, they did the same. Anything they saw done they would mimic, and with an extraordinary degree of accuracy. On these canoes approaching the ship, the principal one of the family, or chief, standing up in his canoe, made a harangue. He spoke in G natural, and did not vary his voice more than a semitone. The pitch of the voice of the female is an octave higher. Although they have been heard to shout quite loud, yet they cannot endure a noise. When the drum beat, or a gun was fired, they invariably stopped their ears. They always speak to each other in a whisper. Their cautious manner and movements prove them to be a timid race. The men are exceedingly jealous of their women, and will not allow any one, if they can help it, to enter their huts, particularly boys.

'The women were never suffered to come on board. They appeared modest in the presence of strangers. They never move from a sitting posture, or rather a squat,

with their knees close together, reaching to their chin, their feet in contact, and touching the lower part of the body. They are extremely ugly. Their hands and feet were small, and well-shaped, and from appearance, they are not accustomed to do any hard work. They appear very fond, and seem careful of, their young children, though on several occasions they offered them for sale for a trifle. They have their faces smutted all over, and it was thought, from the hideous appearance of the females, produced in part by their being painted and smutted, that they had been disfigured by the men previous to coming alongside. The men are employed in building the huts, obtaining food, and providing for their other wants. The women were generally seen paddling their canoes.

'When this party of natives left the ship and reached the shore, the women remained in their canoes, and the men began building their temporary huts. The little children were seen capering quite naked on the beach, although the thermometer was at 40 degrees. On the hut being finished, which occupied about an hour, the women went on shore to take possession of it. They all seemed quite happy and contented.

'Towards evening Messrs Waldron and Drayton visited their huts. Before they reached the shore, the natives were seen making a fire on the beach for their reception, evidently to avoid their entering the huts. On landing, one of the men seemed anxious to talk with them. He pointed to the ship, and tried to express many things by gestures; then pointed to the south-east, and then again to the ship, after which, clasping his hands, as in our mode of prayer, he said "Eloah, Eloah," as though he thought we had come from God.

'After a little time they gained admittance to the hut. The men creeping in first, squatted themselves directly in front of the women, all holding out the small piece of seal-skin, to allow the heat to reach their bodies. The women were squatted three deep behind the men, the oldest in front nestling the infants. After being in the hut, Mr Drayton endeavoured to call the attention of the man who had made signs to him before entering, to know whether they had any idea of a Supreme Being. The same man then put his hands together, repeating as before, "Eloah, Eloah." From his manner it was inferred that they had some idea of God or a Supreme Being.

'Their mode of expressing friendship is by jumping up and down. They made Messrs Waldron and Drayton jump with them on the beach before entering the hut, took hold of their arms, facing them, and, jumping two or three inches from the ground, making them keep time to some simple song which they chanted.

'All our endeavours to find out how they ignited their fire proved unavailing. It must be exceedingly difficult for them to accomplish, judging from the care they take of it, always carrying it with them in their canoes, and the danger they thus run of injuring themselves by it.

'Their food consists of limpets, mussels, and other shell-fish. Quantities of fish, and some seals, are now and then taken among the kelp, and, with berries of various kinds, and wild celery, they do not want. They seldom cook their food much. The shell-fish are detached from the shell by heat, and the fish are partly roasted in their skins, without being cleaned.

'When on board, one of them was induced to sit at the dinner-table: after a few lessons, he handled his knife and fork with much dexterity. He refused both spirits and wine, but was very fond of sweetened water. Salt provisions were not at all to his liking, but rice and plumpudding were agreeable to his taste, and he literally crammed them into his mouth. After his appetite had been satisfied, he was in great good humour, singing his "Hey meh leh," dancing, and laughing. His mimicry prevented any satisfactory inquiries being made of him relative to a vocabulary.

'One of these natives remained on board for upwards of a week, and being washed and combed, he became

two or three shades lighter in colour. Clothes were put on him. He was about twenty-three years of age, and was unwell the whole time he was on board, from eating such quantities of rice, &c. His astonishment was very great on attending divine service. The moment the chaplain began to read from the book, his eyes were riveted upon him, where they remained as long as he continued to read. At the end of the week he became dissatisfied, and was set on shore, and soon appeared naked again. It was observed on presents being made, that those who did not receive any began a sort of whining cry, putting on the most doleful-looking countenances imaginable.

'They are much addicted to theft if any opportunity offers. The night before they left the bay, they stole and cut up one of the wind-sails, which had been scrubbed and hung up on shore to dry.

'Although we had no absolute proof of it, we are inclined to the belief that they bury their dead in caves.'

Such is the amount of our information respecting this simple and primitive people. We know nothing of their origin, of their social manners and customs, of their language, or of their religion. They are a little section of the human race removed perhaps the farthest of any from civilisation, and in whom, from that very circumstance, we take all the deeper interest. External conditions seem to detain them at the lowest verge of human existence; and yet we believe they might make progress to a better state of being, notwithstanding the apparently insuperable difficulties which now oppose it.

ARTIFICIAL DUCK-HATCHING IN CHINA.

ONE of the greatest lions in Chusan (for we have lions here as well as you in London) is an old Chinaman, who hatches duck eggs in thousands every spring by artificial heat. The first question put to a sight-seeing stranger who comes here is, whether he has seen the hatching process; and if he has not, he is immediately taken out to see the old Chinaman and his ducks. An account of the house and the process will probably interest you, and I therefore send you a leaf of my private journal, which I wrote on the morning of my first visit.

It was a beautiful morning in the end of May, just such a morning as we have in the same month in England, perhaps a little warmer; the sun was upon the grass, the breeze was cool and refreshing, and altogether the effect produced upon the system was of the most invigorating kind, and I suppose I felt it more, having just arrived from Hong-Kong, and suffering slightly from the unhealthy atmosphere of that island. The mist and vapour were rolling lazily along the sides of the hills which surround the plain on which the city of Tanghai is built; the Chinese, who are generally early risers, were already proceeding to their daily labours; and although the greater part of the labouring population are very poor, yet they seem contented and happy. Walking through the city, out at the north gate, and leaving the ramparts behind, I passed through some rice fields, the first crop of which is just planted, and a few minutes' walk brought me to the poor man's cottage. He received me with Chinese politeness; asked me to sit down; offered me tea and his pipe, two things always at hand in a Chinese house, and perfectly indispensable. Having civilly declined his offer, I asked permission to examine his hatching-house, to which he immediately led the way, and gave me the following account of the process. First, however, let me describe the house.

The Chinese cottages generally are wretched buildings of mud and stone, with damp earthen floors, scarcely fit for cattle to sleep in, and remind one of what the Scottish cottages were a few years ago; which now, however, are happily among the things that were. The present one was no exception to the general rule: bad fitting, loose, creaking doors; paper windows, dirty and torn; ducks, geese, fowls, dogs, and pigs in the house and at the doors, seemingly as important, and having equal rights with their masters; then there were children, grandchildren, and, for aught that I know, great-grandchildren, all together, forming a most motley group, which, with their shaved heads, long tails, and strange costume, would be a capital subject for the pencil of Cruikshank or H. R.

The hatching-house is built at the side of the cottage, and in a kind of long shed, with mud walls, and thickly thatched with straw. Along the ends and down one side of the building are a number of round straw baskets, well plastered with mud, to prevent them from taking fire. In the bottom of each basket there is a tile placed, or rather the tile forms the bottom of the basket; upon this the fire acts, a small fireplace being below each basket. The top is open, having of course a straw cover, which fits closely, and which covers the eggs when the process is going on, the whole having the appearance of a vase which we sometimes see placed upon a pedestal at home, or rather exactly like the Chinese manure tanks, which perhaps are less known. In the centre of the shed there are a number of large shelves placed one above another, upon which the eggs are laid at a certain stage of the process.

When the eggs are brought, they are put into the baskets described above, the fire is lighted below, and, according to some observations made with a thermometer, the heat kept up seeming to range from 95 to 102 degrees; but the Chinamen regulate the heat by their own feelings, and not by thermometer, and therefore it will of course vary considerably. In four or five days after the eggs have been subject to this temperature, they are taken carefully out, one by one, to a door in which a number of holes have been bored exactly the size of the eggs; they are then held in these holes, and the Chinamen look through to the light, and are able to tell whether they are good or not. If good, they are taken back, and replaced in their former quarters; if bad, they are of course excluded. In nine or ten days after this, that is, about fourteen days from the commencement, the eggs are taken out of the baskets, and spread out on the shelves which I have already noticed. Here no fire-heat is applied, but they are covered over with cotton and a kind of blanket, remaining in these circumstances about fourteen days more, when the young ducks burst their shells, and the poor Chinaman's shed teems with life. These shelves are large, and capable of holding many thousands of eggs; and it is really a curious sight, particularly during the two last days, when the hatching takes place. The Chinese who rear the young ducks in the surrounding country know exactly the day when they will be ready for removal, and in two days after the shell is burst, the whole of these little creatures are sold, and conveyed to their new quarters.—*Correspondent of Athenæum.*

MONASTIC LIFE IN SCOTLAND.

Their mode of living may be summed up in a sentence—an utter neglect of the duty of religious teachers, and the untrammelled gratification of every passion. Hunting was a favourite pastime of theirs, and of none of their privileges were they more jealous. Their dependents were dragged before their courts, to endure temporal punishment in this world, and to have directed against them anathemas as to the next, for the smallest infraction of their hunting or fishing privileges. With regard to nobles as powerful as themselves, complaints are made to the sovereign, and solemn obligations are taken for the security of these sacred rights. Hart and hind, boar and roe, the cryes of falcons and terns, are to be preserved intact; and hunting with hounds or nets, or setting traps to destroy game, were sins which scarcely repentance could atone for. The monks themselves, too, appear to have been given somewhat to poaching, if we may judge from the jealousy of the neighbouring proprietors. The dull monotony of a religious life they pleasantly variegated by such exhilarating sports, and the contemporary literature is rich in the glowing descriptions of their skill. On rising at the matin bell, the monk, after his orisons were said, would, if of a placid disposition, take his rod, and on the banks of the classic Tweed, or at the Falls of Clyde, he could with great benefit pass the forenoon. But if, again, of a more energetic disposition, his hounds and his nets would do effectual execution upon the game of the monastic preserves. On the monk's return, he would shrive any unfortunate victim, who, like John de Graham, was ignorant of the law, and susceptible of flattery, and, with an appetite sharpened by his forenoon's exercise, he would sit down to the plentiful repast which his hunting or fishing skill had catered. Wheat bread was provided by the fidelity of his flock; a flagon of wine, too, was not wanting to wash down the repast; and from a transaction with certain Florentine merchants, it would appear that the priests of Glasgow had acquired a refined taste for foreign luxuries. Good living, however,

did not always thrive with the monkish constitution. Pious as they were, they still were subject to the ills of life, and not above the aid of the *Materia Medica*. The Glasgow fathers especially appear to have been very much troubled with peculiar affections of the stomach, and have formally preserved in their cartulary a famous pill, to prevent flatulency. The peculiar ingredients of this composition are stated in detail; but as our medical knowledge is not so extensive as to enable us to speak decidedly of its merits, we think it better not to quote the receipt, in case it may be incautiously applied. Another celebrated pill is given, with the recommendation that Pope Alexander (the Sixth?) frequently used it, and which had the great advantage of not compelling the patient to intermit his usual diet or his flagon of wine. The religious service of the day, it might be thought, would break up for a little the hilarity of the jolly brotherhood. But this opinion is founded on mistake. They threw a pleasant air even over the gloom of devotion, and in their religious duties they were unable to restrain their jokes. This having apparently scandalised the vulgar, certain rules were enacted, by which their conduct in this respect was to be regulated. The cartulary of Moray contains the *Constitutiones Lyncolnienses*, inserted as proper rules for the priests of that northern province, from which we learn that they were to enter the place of worship, not with insolent looks, but decently, and in order; and were to be guilty of no laughing, or of attempting the perpetration of any base jokes (*turpi risu aut jocu*), and at the same time were to conduct their whisperings in an under tone. Nature, however, will have its way. A full stomach is not the best provocative to lively attention, and it is therefore far from wonderful that the fathers dosed. Ingenuity provided a remedy even for this, and the curious visitor will find in the niches of the ruined walls of the ecclesiastical edifices of other days oscillating seats, which turn upon a pivot, and require the utmost care of the sitter to keep steady. The poor monk who would dare to indulge in one short nap, would, by this most cruel contrivance, be thrown forward upon the stone floor of the edifice, to the great danger of his neck, and be covered at the same time with 'the base laughter and joking' of his brethren.—*North British Review.*

SLOW PROGRESS OF IMPROVEMENTS.

The *Times*, a few months ago, had some remarks on this subject, in which there is too much truth. After alluding to the number of associations for public improvement which every day gives birth to, and which seem to imply that there is no government to take up such public matters, it proceeds to say—The reports of commissioners published within these ten years are a perfect encyclopædia of commercial, statistical, and sanitary lore. There are blue books enough to remodel a world, if a world could be found tractable enough for the process. But there it ends. As for any good that's done, parliament might as well be a club of *saxons*. It ostentatiously proclaims its knowledge. It perceives and commends improvement, but acquiesces in deterioration. Three sessions have passed away since the report from the Poor Law Commissioners on the sanitary condition of the labouring population. The volume is fast sinking down the gulf of time, and nothing is done. Other reports on the same subject have followed, and still remain, what for the present they are likely to remain, virgin reports, wedded to no legislation. Our respectable senators might as well amuse themselves with dropping straws into a stream, and watching their downward progress, as in putting out blue books, destined only for the race of oblivion. The absurdity must stare our legislators in the very face, when they find themselves announcing truisms and notoriety acknowledged and known by all the world years and years. Why do people who, in their place and legitimate post, can remedy ills, content themselves with proclaiming them to those who cannot? All the world knows, of course, that Harley Street is not only a pleasanter, but a healthier locality than Houndsditch; that streets are better than lanes, lanes than courts and alleys; that one family in a tenement is better than ten, one bed in a room better than half-a-dozen, and so on; that air, water, and fire, are as necessary to health as to comfort; that sewers under ground are better than noonday filth. Since there were cities, these truths have been matters of painful recognition. The recent reports only show, with details and circumstances, that what is true everywhere, and especially of all populous cities, is true in the most populous city of all. My lords and gentlemen, we know it—everybody

knows it: what then? The answer is, that we are to have a society to further these objects. Why! what are members of parliament made for, if they are to delegate the economical functions of government to No. 17, two pair to the right, Exeter Hall? The legislature can effect these objects—a society *can not*! Every year only strengthens the conviction of sensible men, that governments must give a higher place to questions of social economy, and undertake them with a stronger hand, a wider aim, and more uniform system. The great object of government is the *common weal*. Whatever the state can recognise and pronounce to be hurtful to the public, ought to be considered a *crime*. Nay, it should not allow a man to hurt himself if it can prevent it, for wilful self-injury is only a degree of self-destruction. An undrained street, an uncovered sewer, a crowded garret, want of water, an atmosphere needlessly vitiated with miasma or smoke, are all so many wholesale manslaughters which kill their thousands to the ones that die less silently by the knife or the bludgeon, by careless carters or uncovered machinery. We know the jealousy which stands between sovereign power and private liberty; but we venture to predict a time when people will pronounce a liberty to foster hotbeds of moral crime and physical infection, or to poison the air breathed by myriads, as a more enormous license than the toleration of pirates or banditti.'

INFLUENCE OF ACCIDENT ON GREAT MEN.

It is a curious coincidence that the two greatest Chancery lawyers of their day should both have been forced into the profession by incidental circumstances. Romilly says, that what principally influenced his decision was the being thus enabled to leave his small fortune in his father's hands, instead of buying a sworn clerk's seat with it. 'At a later period of my life—after a success at the bar which my wildest and most sanguine dreams had never painted to me—when I was gaining an income of £8000 or £9000 a-year—I have often reflected how all that prosperity had arisen out of the pecuniary difficulties and confined circumstances of my father.' Wedderburn (Lord Loughborough) began as an advocate at the Scotch bar. In the course of an altercation with the Lord President, he was provoked to tell his lordship that he had said as a judge what he could not justify as a gentleman. Being ordered to make an apology, he refused, and left the Scotch for the English bar. What every one thought his ruin, turned out the best thing that could happen to him—

'There's a divinity that shapes our ends,
Rough how them how we may.'

Lord Tenterden's early destination was changed by a disappointment. When he and Mr Justice Richards were going the home circuit, they visited the cathedral at Canterbury together. Richards commended the voice of a singing man in the choir. 'Ah,' said Lord Tenterden, 'that is the only man I ever envied! When at school in this town, we were candidates for a chorister's place, and he obtained it.' It is now well known that the Duke of Wellington, when a subaltern, was anxious to retire from the army, and actually applied to Lord Camden (then lord-lieutenant of Ireland) for a commission of customs! It is not always true, then, that men destined to play conspicuous parts in the world have a consciousness of their coming greatness, or patience to bide their time. Their hopes grow as their capacity expands with circumstances; honours on honours arise like Alps on Alps; in ascending one they catch a glimpse of another, till the last and highest, which was veiled in mist when they started, stands out in bold relief against the sky.—*Edinburgh Review*.

IMITATION.

Amongst the causes assigned for the continuance and diffusion of the same moral sentiments amongst mankind, may be mentioned imitation. The efficacy of this principle is most observable in children: indeed, if there be anything in them which deserves the name of an instinct, it is their propensity to imitation. Now, there is nothing which children imitate, or apply more readily, than expressions of affection and aversion, of approbation, hatred, resentment, and the like; and when these passions and expressions are once connected, which they soon will be by the same association which unites words with their ideas, the passion will follow the expression, and attach upon the object to which the child has been accustomed to apply the epithet.—*Paley*.

GOOD SEED.

Like seeds deep hid in the thankless earth,
Or buried in dead men's tombs,
'Till the spade of the labourer casts them forth,
Or the traveller's search exhumes—
Revived again in the upper air,
Not one of their powers is lost;
Plant them, they root and flourish fair,
And bring forth a goodly host
Of offspring, though centuries may have past
Since they in their darksome cells were cast.

So is the word the poet preaches:
The good seed may seem to die,
And the fruit of the holy creed he teaches
Be hidden from human eye:
If the vital germ of truth be there,
It never can perish wholly,
Rich blossom and fruit it will surely bear,
Though for long years buried lowly;
Other hands may bring it to light, and tend;
But the seed of good thoughts has a fruitful end.

D. M. M.

BOOKS BREEDING IN NOVEMBER.

In the month of November 1844, writes a correspondent of the Zoologist, my attention was attracted to a large solitary nest in the outermost branches of an old elm tree, not far from the park entrance to Broughton Castle, Oxfordshire: at first I concluded it must be a magpie's, which had become exposed by the fall of the leaf; however, on looking again, I discovered that it was inhabited by a pair of rooks; and was afterwards told by some labourers, who had watched its building, that the rooks were now sitting. By the assistance of a glass, I was soon able to confirm their statement, as well as to watch the process of incubation. I think it must have been on the 18th of November that the young were hatched, at least I judged so from seeing the old ones carry up food (grubs, &c. which seemed plentiful) for several days after that date. The frosty mornings of the following week made the young ones cry out bitterly; when the weather becoming more and more severe, put an end to their sufferings. It seemed some time before the old ones could believe it; at any rate they were very unwilling to quit the branches near their nest. The situation which they had selected was several hundred yards from the regular rookery, and, during the time of incubation, six or seven other rooks might be seen looking on in mute astonishment at their neighbours' mistake. I do not recollect ever having seen on record such an instance as the above. Was it the second brood of the year, or the brood of birds which were hatched in the early spring? [We are aware of a pair of house-sparrows having commenced building for their second brood on the 14th of September in the same year. The nest, which was among the higher branches of a plane, was completed in a day or two from an abundance of dried hay and knot-grass at hand, and the female began to sit on the 25th or 26th. A few days after, the branches were stripped of their decaying leaves, and the nest thrown to the ground, showing the remains of five eggs, four of which would have been productive.]

THE REVENUES OF THE MIND.

The ear and the eye are the mind's receivers: but the tongue is only busied in expending the treasure received. If, therefore, the revenues of the mind be uttered as fast or faster than they are received, it cannot be but that the mind must needs be bare, and can never lay up for purchase. But if the receivers take in still with no utterance, the mind may soon grow a burden to itself, and unprofitable to others. I will not lay up too much, and utter nothing, lest I be covetous: nor spend much, and store up little, lest I be prodigal and poor.—*Bishop Hall*.

Published by W. and R. CHAMBERS, High Street, Edinburgh (also 98 Miller Street, Glasgow); and, with their permission, by W. S. OAK, Amen Corner, London.—Printed by W. and R. CHAMBERS, Edinburgh.

Complete sets of the Journal, *First Series*, in twelve volumes, and also odd numbers to complete sets, may be had from the publishers or their agents.—A stamped edition of the Journal is now issued, price 2½d., to go free by post.

PRICE 1½d.

NEW FACTS RESPECTING MARY QUEEN OF SCOTS.

A RUSSIAN noble, Prince Labanoff, has devoted fourteen years to the collection of documents respecting Mary Queen of Scots, including her own letters, and the communications of her ambassadors, and the result of his labours has just appeared in seven goodly octavos. The degree of originality pertaining to this publication may be partly estimated from the fact, that it presents four hundred of the queen's own letters, hitherto unknown to the public. The most remarkable feature of the work is its tendency to clear Mary's name of much of the reproach that has hitherto rested upon it, and to add to the likelihood which formerly an acute, and at the same time impartial person, might have apprehended, that the common view of this lady's character is in a great measure a piece of party fiction. We propose here to run over a few of the new matters which combine in Prince Labanoff's collection to this effect, not with any design to consider the question critically, which indeed in our short space would be a vain attempt, but merely to help a little towards the gratification of the public curiosity on a point which will be adverted to in many quarters where the perusal of the entire book is unattainable.

What appears most broadly and strikingly in this collection is, the zeal and firmness of Mary in her religion. From first to last—as the queen of two states, and as a hopeless captive in a foreign land—she maintains but one tone as a sincere Catholic, ready alike to use power when she has it, and when she has not, to sacrifice her life, for the restoration of that form of faith in her own country and in England. It appears that, at the close of her life, having no hope of her son siding with the Catholic party, and having been heartlessly deserted by him, she bequeathed all her interest in the English succession to Philip II. of Spain; an impotent act of course, but showing will. Seeing this determination of her mind, and remembering the atrocious acts done in those days for the objects cherished by her—and by none were more wicked deeds done than by her own uncles of the house of Guise—we are not to wonder that she should have had so little friendship from the partisans of the opposite faith, or that men of their stamp in such an age should have been governed by no nice scruples in their conduct towards her. It is not our part, however, to regard the motives or objects of parties: we are called on solely to consider their acts, to ascertain what these truly were, and to judge of them according to the abiding and universal rules of justice.

The more controverted part of Mary's life commences with her marriage to Lord Darnley in 1565. It now clearly appears that she was led to marriage at this time against her will, and as a measure of political

expediency; and that she chose Darnley from no personal preference, no romantic attachment, as has been thought, but because he was a Stuart, next to herself in the English succession, and, as a Catholic, agreeable to that section of her subjects which she was most anxious to gratify. One powerful consideration in this marriage was its enabling her to bear her part against the machinations of her natural brother, the Earl of Murray, whose ambition it was to be in one shape or another the actual ruler of Scotland. The marriage was disappointing to Murray and to Elizabeth; and the former, with the secret aid of the latter, immediately raised a rebellion against his sister. Defeated by Mary and the faithful part of her subjects, he fled to the English court, where he received protection. The concern which Randolph, the English resident at Edinburgh, had in Murray's rebellion, is shown in a letter of Mary to her English ambassador, Robert Melville, now published for the first time: 'Melville,' she says, 'it is not unknown to you how, before your departing, we had granted our pardon to John Johnstown, who coming home, and this same day being before us, we inquired of him the cause of his departing. He answered, that in the middle of August last he was sent for by Master Randolph to come and speak with him at his lodging, at David Forrester's, whither he came; and after some declaration made to him by Mr Randolph, how he was my Lord of Murray's servant, and one whom he would specially trust, Master Randolph delivered to him three sacks of money sealed, wherein was contained (as was said) three thousand crowns, which he, at Randolph's desire, conveyed to St Andrews, and delivered the same to my Lady Murray, receiving her receipt for it, which he carried back to Randolph. And fearing that the matter might be discovered, he (Johnstown) durst not remain, but departed. And at the very time that we were receiving this declaration, Mr Randolph happening to be present with our council discussing matters relating to the borders, we thought it not inconvenient to report to him the report made to us, and show him plainly that in consideration the queen, our good sister, his mistress, had not only to our dearest brother, the king of France, and to his ambassador resident there, but also to Monsieur Rambolet, his late ambassador here, and by Randolph to ourselves declared, that she had neither aided, nor was willing to aid and support our rebels with men, money, or otherwise, to our displeasure; which we take to be undoubtedly true, and will look for no other at her hands; such account do we make of her and her declaration, given in that behalf, which we can in no wise mistrust. Yet that he, her servant and minister, occupying a peaceable charge, contrary to her will and meaning, should undertake a thing so prejudicial to the peace, we could not but think very strange of it, and had right good occasion to be offended

with his misbehaviour, that within our own realm had comforted them with money to our displeasure, who were our rebels, and with whom we had just cause to be offended.'* Randolph, she adds, first denied the charge, but when evidence was brought against him, he stood at bay, and announced that he held himself as only answerable for his conduct to his own mistress. The crookedness of policy thus shown in Mary's enemies contrasts strongly with her implicit, unsuspecting faith in the good feeling and conscientiousness of Elizabeth.

The documents here adduced respecting the murder of Riccio, make clear the motives of the various parties; Darnley having none besides his wish to secure the crown matrimonial, in which the poor Italian had opposed him. Randolph wrote at the time to Cecil a scandalous letter impeaching the queen's honour. His credibility as a witness against her so soon after she had convicted him of the basest duplicity, might be safely left to impartial consideration; but it is well to know that, from the various documents now brought forward, there cannot remain the slightest shade of suspicion against Mary on this score. The assassination of Riccio, over and above the personal motive of Darnley, was a Protestant move necessary to turn affairs at the Scottish court, so as to allow of Murray and his friends being pardoned for their rebellion. It was, in the sixteenth century, what a change of ministry through a vote in the House of Commons is at the present day. The religious feelings of that time, so far from forbidding, stimulated such barbarities.

The whole behaviour of Darnley from this time was such as to alienate the affections of the queen. He seems to have been an utter fool, with all the qualities of intractableness and waywardness which that term implies. Yet all the evidence that appears represents Mary as submitting to his follies with patience. In November 1566, four months after the birth of her son, her principal lords—Murray, Bothwell, Huntley, Argyle, and Maitland of Lethington—came formally to her at Craigmillar, to propose that she should divorce Darnley; but she told them that she would abide the will of Providence to be relieved from her present sufferings, and positively refused to go into the scheme. One reason for this resolution on Mary's part may have been of a political nature. In her communications at this time with Elizabeth, it is evident that her predominant aim was to secure her being declared the heir-presumptive of the English throne. It might seem to her that the English people were not the more likely to favour her hopes, if they saw her engaged in suing a divorce from her husband, not only from a consideration of the indecorum which always attends such an act, but because it lessened her prospect of heirs of her own body. Within a month of the death of Darnley, namely, on the 13th January 1567, she is found writing a complaisant letter to Elizabeth, urging her pretensions to be declared the heir of the English crown. 'Always,' she says, 'have we commended us and the equity of our cause to you, and have certainly looked for your friendship therein; whereon we have continually trusted; and now we think us fully assured of the same, having thereof so large proof by knowledge of your good mind and entire affection, declared by your said ambassador, as also by our servant Robert Melville; not doubting but in time convenient you will proceed to the perfecting and consummation of that which you have begun to utter, as well to your own people as to other nations, the opinion you have of the equity of our cause and your affection toward us; and namely, in the examining of the will supposed to be made by the king your father, which some would lay as a bar in our way; according to your own promise to us, as well contained in your letter sent by our servant Robert Melville, whereof he has made us report that you would proceed therein before your

nobility (being at this present assembly) departed towards their own houses.' At the date of this letter, Darnley was sick of small-pox. Immediately after, Mary was informed of a plot which he was alleged to have formed for seizing the infant prince, and getting himself made regent in his name. Even while having such grounds of suspicion against him, she is found writing to her ambassador in France, the Archbishop of Glasgow—'Always we perceive him occupied and busy enough to have inquisition of our doings; which, God willing, shall always be such as none shall have occasion to be offended with them, or to report of us any way but honourably; howsoever he, his father, and their favourers speak, who we know want no good will to give us trouble, if their power equalled their inclinations.' It need hardly be asked, if a person with such reasons for standing well with the world, and who gives such incontestable evidence of her having been alive to those reasons, was at all likely to be engaged in a conspiracy for the murder of her husband? an event which, whether she had any concern in it or not, could not but be damaging to her immediate affairs, as well as her prospects.

A letter of Mary to the Archbishop of Glasgow, written the morning after the murder of Darnley, adverts to some information he had communicated to her as to designs against herself; and she expresses her belief that the explosion of the house was designed for herself likewise, as she had slept in it three out of the seven preceding days, and was only prevented from sleeping in it that night by the chance of having had to attend a masque at Holyroodhouse. Bothwell, the actual murderer, now comes prominently forward. The common supposition is, that Mary favoured his escape from the trial to which he was subjected at the instance of Darnley's father. It appears that he was in reality protected by a confederation of nobles, amongst whom were those who soon afterwards deposed the queen. These men now associated in a bond for the purpose of procuring a marriage between Mary and this atrocious member of their corps. And it is remarkable of this association that its leader, Morton, had been concerned in the murder of Darnley. That the queen had any inclination to the proposed match, there is not a particle of sound evidence; for the celebrated letters afterwards produced in a casket are manifestly a base and clumsy forgery. That it was, on religious grounds, objectionable to Mary, is indubitable, for Bothwell was a Protestant. See, then, the actual progress of events. Bothwell, armed with the bond favouring his suit of Mary's hand, seized her person as she was travelling from Stirling to Edinburgh, and immediately conducted her to his castle of Dunbar, where she was kept a prisoner for several days. Let it be remembered that, at that time, there was no standing army, not even a regiment of guards, to support the head of the government in Scotland. Mary depended, for the means of maintaining her place and function, upon the good-will of the nobility. Is it surprising that, sinking under this indignity, to which her chief nobles appeared to have conspired, she should have been induced, for the sake of her reputation as a woman, as well as for maintaining her place as a queen, to consent to the odious match which was soon after carried into effect? And can we have any doubt of the real views of Morton and his confederates in promoting the marriage, when we find them immediately after taking advantage of the infamy which it produced, to raise the standard of revolt against her, and in brief space effecting her dethronement? In the whole series of proceedings, Mary appears as the victim of force. At the marriage, she was habited in deep mourning. The state of her feelings on the evening of the day of the nuptials, is evinced by De Croc, the French ambassador, who visited her at her own request. 'I perceived,' says he, 'a strange formality between her and her husband, which she begged me to excuse, saying that if I saw her sad it was because she did not wish to be happy, as she said she never could be, wishing only for death. Yesterday,' he adds, 'being all alone in a

* For the translation of this and some of the ensuing extracts from the queen's correspondence, we are indebted to the Athol House.

closet with the Earl of Bothwell, she called aloud for them to give her a knife to kill herself with. These who were in the room adjoining the closet heard her.* There is also evidence of Bothwell regarding her as a person requiring to be watched, that he might work out his ends successfully. In her own communication to the French court respecting the marriage, she speaks as follows:—'When he saw us like to reject all his suit and offers, in the end he showed us how far he had proceeded with our whole nobility and principals of our estates, and what they had promised him under their own handwriting. If we had cause, then, to be astonished, we remit us to the judgment of the king, the queen, and others our friends. Seeing ourself in his power, sequestered from the company of our servants and others of whom we might ask counsel; yea, seeing them upon whose counsel and fidelity we had before depended, whose force ought and must maintain our authority, without whom in a manner we are nothing, beforehand already won over to his wishes, and so we left alone as it were a prey unto him; many things we resolved with ourself, but could never find a way of escape. And yet gave he us little space to meditate with ourself, ever pressing us with continual and importunate suit.' It may be asked if this is the language in which she could have been expected to write to a friendly potentate respecting a husband whom she had married under the influence of an infatuated passion, as represented by her enemies. In short, while there is no worthy evidence of any love on Mary's part towards Bothwell, or of a single motive of another kind which she could have for such a marriage; while, on the contrary, it was, as the event proved, likely to be most injurious to her; there is abundant evidence of the affair having sprung from the ambition of this profligate man, and been effected by the assistance of a set of his accomplices, who saw in this step a sure means of effecting an object long desired by them—the destruction of a ruler opposed to them in faith, and whose continuance in power was dangerous to the Protestant cause. In five weeks from the marriage these men had immured the queen in Lochleven, while Bothwell was an outlaw roaming through the northern seas.

The whole subsequent conduct of Mary respecting Bothwell is accordant with the supposition of the marriage having been contrary to her will. She parted with him at Carberry without a sigh. In her letters after that event, she is not found alluding to him. That she declined a proposed divorce the month after their parting, may be considered as owing to her having been pregnant of a daughter, now ascertained to have been born at Lochleven, and who died a nun in France. The trial got up between Elizabeth and the Scotch lords, during her imprisonment in England, with a view to establish her guilt, ended, as is well known, in a complete failure. But the crowning evidence on the exculpatory side is in the circumstances connected with the death of Bothwell. This wretched man perished in a Danish prison ten years after his fall. Mary then wrote as follows to the Archbishop of Glasgow:—'Information has been received here of the death of the Earl of Bothwell, and that before his decease he made an ample confession of his crime, and declared himself the guilty author of the assassination of the late king, my husband, of which he expressly acquitted me, testifying to my innocency on the peril of his soul's damnation; and since, if this be true, this testimony would be of the greatest value to me against the false calumnies of my enemies, I beg of you to investigate the truth by all the means possible. Those who were present at this declaration, which was afterwards signed and sealed by them in the form of a last will and testament, are Otto Braw, of the castle of Eloembro; Paris Braw, of the castle of Vascut; Mr Gullun-stame, of the castle of Fulkenster; the Bishop of Skopen,

and four magistrates of that town. If De Menocaulx, who has formerly trafficked in that country, would make a voyage thither to inquire more particularly, I would be glad to employ him for the purpose, and to furnish money for his travelling expenses.' Now this document, which Mary wished to be produced, was sent to Elizabeth, but *by her suppressed*. Morton, who was now regent in Scotland, is at the same time found imprisoning a man for spreading a report of the existence of such a document. Prince Labanoff has, however, obtained an original and undoubted copy of Bothwell's declaration, showing that the account which Mary had heard of it was correct. A man in Bothwell's circumstances could have no motive to clear the character of Mary, if she had actually been guilty. The publication of this important document is deferred by the prince till he shall give us an eighth and final volume, stating his own impressions from the interesting series of papers contained in the seven already published.

Such are the leading points of the evidence now brought out in favour of the innocence of Mary. It is an evidence which will not be satisfactory to the sectarian spirit still alive respecting the history of her times; but to minds independent of that influence, it will carry much weight. The wonder with candid persons will now be, that they did not long ago suspect the soundness of the prevalent views respecting Mary, seeing that she was exactly in those circumstances which make fair treatment next to impossible. All monarchs succeeded by new and hostile dynasties, all statesmen and all political ideas superseded by others of an opposite stamp, are sure to be misrepresented. Knowing these things, it appears strange that we did not long since suspect the vulgar history of Queen Mary, merely from the circumstances that the representatives of opposite religious and political systems had been in possession of power ever since her time. We might have been startled, if by nothing else, by reflecting that Mary is held infamous on a merely suspected connexion with the crime of murder, while Elizabeth, who is known for certain to have taken measures to have Mary assassinated, who called Sir A. Pawlett a precise fellow, because he would not do the deed, and who actually did murder Mary under form of law, is handed down as a paragon of excellence. The impartial public has been deficient in shrewdness, but we trust it will not be deficient in manfulness to express its sense of the new bearing of this question.

FARMING PAST AND PRESENT.

Nothing could be more erroneous than the attempt which is sometimes made to draw a line of distinction between the principle of raising food and the production of wares in wool, in linen, in wood, or in iron. The one is about as much a manufacture as the other; a trading with capital, an endeavour to accumulate profits, from the supply of a marketable commodity, in the shortest time, and by the cheapest process. It is true that at one time a wider difference existed between the culture of the soil and those arts which are usually termed manufactures; but that period has long since passed, and the two great branches of industry are every day more closely approximating. The farmer—we speak more particularly of Scotland—no longer builds his own sheds, makes his own harness, or fashions the implements by which he prepares the soil, but calls in the assistance of the mason, the joiner, mechanist, and chemist, himself taking only the last division of the labour by which the commodity is produced. Thus it is that farming, as a branch of industry, differs in no respect from cotton weaving: it is an art, to the perfection of which other arts must contribute their share; its demands upon their aid becoming numerous in proportion to the demands upon its produce. Nothing could be more conclusive of this view than a contrast between the realities of British farming in 1845, and those which existed sixty or eighty years ago,

* Translated in W. Fumhalls's edition of *Letters of Mary Stuart*.
Edinburgh: 1846.

Let us take, in the first place, the erections of the farm-stead, as these in every case must form the first step towards an establishment. At the period to which we refer these were little better than mud-huts, being constructed of turf, or of alternate layers of turf and stone, and covered with straw, heath, or rushes. There might be some small necessity for carpentry in the framing of the roof or door, but otherwise the whole could be accomplished by the hands on the farm. Now, a first-rate Scottish farm-stead will cost several thousand pounds, requiring the joint labour of the architect, builder, joiner, slater, plumber, and ironsmith. The walls are of well-worked stone, the woodwork usually of foreign timber, thereby calling in the assistance of the timber-merchant and ship-owner, and the slates or tiles also imply the work of another class of artisans. Indeed, a well-appointed farm-stead, with all its offices, its water-pipes, liquid manure-tanks, boiling and steaming apparatus, alicing, chopping, and thrashing machines, requires in every respect as great a variety of labour and mechanical skill as does the erection of any other factory. Or let us look at the interior of the buildings, and compare the rough rude finish of a century ago with the finely-paved, plastered, and partitioned stalls of the present day. Then, the cow-houses and stables were dark, dingy, ill-cleaned hovels; now, they are lighted and ventilated, and their inmates fed and curried with a care exceeding that—we are ashamed to own it—which some would grudge to bestow on their peasantry. In the mere erections of a farm, therefore, there is scarcely a point in common between the two periods; no comparison between the frail hovel of turf and straw, and the substantial structure calculated to endure for centuries. We never look, in fact, from the top of the passing coach at a farm-stead, with its symmetrical lines of elegant architecture and its tall chimney-stalk, but we feel we have a factory before us, as much as if a spinning-mill or iron-foundry formed the prospect.

Again, in directing our attention to the soil, either as regards the amount under culture, or the style of cultivation, nothing could be more strikingly different. Eighty years ago, only a few fields around the home-stead came under the plough, the rest were left in rough pasture, heather, or furze, as laid down by the hand of nature. Nothing could be more truly primitive than the agriculture of our grandfathers. Fences were few, and these of turf or dry stones; hedges and beltings of wood were only coming into fashion round the mansions of the proprietors. Draining was unknown; the dry knolls and slopes alone were tilled; the meadows were left for hay; any spring or superabundance of water on ploughed land was led off by an open furrow, to expend itself in the next lower level; trenching was never thought of; and altogether, culture, in the literal acceptance of the term, was of the most imperfect description. Nor were the crops aimed at anything beyond what might have been expected from such a style of cultivation. Oats, peas, barley or bigg, and an attempt at wheat on some of the better lands, may be said to have constituted the whole agricultural produce of Scotland; for potatoes were merely known as a novelty, and turnips, beet-root, carrots, the artificial grasses, and other green crops, were heard of only as things peculiar to more favoured climates. At present, what is the state of matters, at least in the more available districts? Every acre that the plough and spade can reach is under culture; substantial fences of stone and lime, hedgerows and ornamental paling, are things quite common; and beltings and clumps of wood are thickly scattered over the face of the country, alike for shelter and ornament. Draining and trenching are working wonders on the soil and climate; every rough place is made smooth; the furze, heath, and broom are supplanted by crops of grain; and bogs and morasses are converted into fertile fields. Crops that our forefathers never could have dreamed of, are now reared luxuriantly under the climate of Scotland, creating a total revolution both in our style of living and in

the capabilities of the country as to population. Wheat and potatoes may be said to be the staple support of the populace; turnips, beet-root, and the artificial grasses, are the basis of that enormous amount of butcher-meat which is now consumed; oats and barley are now subordinate articles of food. By this high advancement the rental of the land has in some cases been trebled; the farmer is compelled to seek from every square yard its produce; and owing to the equality to which he has brought it by modern skill, he can calculate upon its capabilities with about as much certainty as the engineer can calculate the power of his steam engine, or the printer the number of sheets which his machine will throw off in a given time.

This high state of cultivation could not, however, have been brought about except by improved implements and machinery—without, in fact, the aid of the mechanic, engineer, chemist, and naturalist. Eighty years ago, a few spades and mattocks, rude wooden ploughs and harrows, a wain or two of wicker or of boards, some pack-saddles and rope harness, a flail and a set of winnowing riddles, constituted the sum total of a farmer's mechanical outfit: now, how different is the picture! His ploughs are of iron, and fashioned upon scientific principles as to draught, width and depth of furrow; and we have at this moment upwards of a score of models before us, each laying claim to some advantage as to draught, drilling, subsoiling, trenching, or even to draining, for this process can now be executed by the plough alone. Nay, we have seen the steam plough at work, and have faith in the prediction that, as the surface of the country becomes more easy and regular under the present systems of culture, this gigantic machine will come into very general operation. As with the plough so with the harrow; the wooden implement has been superseded by one of iron, and by other instruments of the same family, as the grubber, the scarifier, the horse-shoe, &c. each being applicable to some special purpose. The clodpole and mallet, which were applied to the refractory glebe of former years, have generally given way to rollers of various kinds; and the hand that used to scatter the seed broadcast, has in many cases only to tend a machine that will do the work with a precision, regularity, and economy, setting the human instrument at defiance. We often wonder what would be the surprise of a departed grand-uncle, who was wont to sow his little acre of turnip by shaking a bottle of seed along the drills, the discharge being regulated by a bit of perforated paper tied over the mouth of the vessel, were he to revisit the world, and see a first-rate turnip machine taking four drills at once, and not only sowing and covering the seed, but dropping and earthing the manure at the same time. Nothing certainly could more excite his simple wonder; and yet the turnip-sowing machine is but one of a hundred similar inventions, all calculated to lessen the sum of rural labour. In former times, the mechanical skill of the country joiner and blacksmith was quite sufficient for the wants of the farmer; nay, these men were mere labourers, fashioning the material which he usually supplied. Now, the system is totally revolutionised: we have the 'agricultural implement maker,' as a distinct profession, dwelling in cities, possessing large capital, and employing draughtsmen, joiners, turners, engineers, and braziers. New inventions are rising into notice every day; patents are rife; and few of our large towns but have museums, in which the results are displayed for the study of the agriculturist.

It would be fruitless to attempt an enumeration of modern agricultural implements and inventions, and yet there are two or three which cannot be omitted in a contrast like the present. In the matter of vehicles and their outfits, nothing could be more widely dissimilar than the attainments of the two periods. For want of good roads, pack-saddles were more numerous than wains or cars; and wains were rude sledges, dragged slowly along by oxen. The harness of the

cattle—whether horses or oxen—was generally made at by-hours by the ploughmen or farmer himself, and consisted of an assortment of straw or tow-ropes, wooden frames, and thongs of untanned skins. Now, the carts and wagons are of light and elegant construction, requiring the labour of a special class of artisans; and nothing could be more complete than the harness of the saddler, which calls in the skill of the tanner and currier, and the art of the brazier and silversmith. Could we recall the shaggy farm-horse of 1745, with his rude furniture, and place him alongside of the sleek stately animal of the present day, caparisoned in his elegant harness, the contrast would be as decidedly startling as that between the savage in his tattered blanket and the well-dressed gentleman. Again, if we compare the simple flail of our ancestors with the improved steam thrashing-mill of the present day, we shall find a difference even more astonishing. Sixty years ago, the ploughman prepared two rods of well-dried ash, pierced an eye in each, connected them by a free hinge of cord or dried eel-skin, and this constituted the *flail*, the only thrashing implement till a recent period which Britain could boast of. Slow, tedious, and expensive, this implement could no more have met our present requirements than could the spinning-wheel of our grandmothers. The thrashing-machine took its place, at first small and imperfect, but now on many farms a complete instrument—moved by steam, and not only thrashing out the grain, but winnowing it, dressing it, and sacking it quite ready for the market. The farmer need never unyoke his horses from their ordinary field-work, so far as thrashing is concerned; he has only to light his furnace in the morning, by breakfast the steam is up, and before dinner as much grain is thrashed, cleaned, and ready for sale, as a dozen flail-men could have prepared in a month. In fact, the thrashing-mill is one of the most obvious applications of mechanical skill to the manufacture of human food, and quite as perfect in its results as is the spinning-mill or power-loom.

It is not, however, in the mere substitution of ingenious and powerful machinery for implements simple and imperfect that agriculture is approximating more and more to the condition of a manufacture; there are inventions and appliances totally new which bear equally on this view of the matter. Take, for example, the subject of draining. The excavations are not now filled merely with stones gathered from the land or dug from the quarry, but are fitted with tiles and pipes of clay, concrete, and other substances. Nor are these tiles fashioned slowly by the hand, but are pressed and moulded into form by machines with a precision and rapidity that enables the farmer to lay down drains not by feet and yards but by miles. Or turn we to the subject of manure, the last and least thought of by our forefathers, who allowed their dung-heaps to run to waste, exposed to the sun and rain, as things of secondary importance. On this point the physiologist and chemist have created a sudden and total change of opinion, and every scrap of farm manure, and every drop of animal liquid, is now collected and preserved with as great care as is the grain that is reaped and thrashed. Not only are dung-pits and liquid manure-tanks built and carefully excluded from the causes of evaporation, but chemical substances are applied to fix the volatile principles, and an immense amount of labour bestowed in the proper preparation of the farm-yard manure. Nay, farther, bones are sought in every quarter, gathered at home, and shipped from abroad, to be crushed for manure; the droppings of sea-birds, under the name of guano, are imported from the rocky islets of Peru and South Africa at many pounds per ton, thus making the meanest of all substances the subject of the most profitable commerce. Nor does the supply of manure end here: the chemist has determined the substances entering into the composition of the various crops; he knows also the constitution of the soil, and can therefore supply to it the elements which the intended crop

shall most require. Thus we have dozens of artificial manures invented, prepared, and patented by the ablest chemists of modern times—again confirming the proposition with which we set out, that in every particular agriculture is more and more approximating to our ideas of a manufacture.

As yet we have said nothing respecting the condition of the farmer as influenced by this rapid advancement; but our comparison would be partial and imperfect without some allusion to the vast change which it has effected in this particular. Formerly, the farmhouse was a humble single-storeyed tenement, with two or three apartments at most, and these but very indifferently furnished; the walls were roughly plastered; there was either no ceiling, or one formed of boards and matting; and in a majority of instances, the floors were earthen. The dairy and poultry were either managed under the same roof, or in adjoining sheds; and the house being situated in the same range or square with the byres and stables, afforded anything but a facility for order and cleanliness. Now, how different is the arrangement! It is only the other day that we visited a Fifeshire farm, and found the dwelling-house rivaling the handsomest of our suburban villas in style and comfort. Embosomed in shrubbery, possessing a suite of public and private rooms, and having the kitchen, scullery, and dairy arranged behind, and screened from view with admirable taste, it was a mansion that might have accommodated a nobleman. Nor is this a solitary instance, for we could point to hundreds of such in the lowland counties, where eighty years ago there was nothing superior to a modern roadside cottage. Then, too, the farmer, dressed plainly in homespun woollen, toiled with his labourers, sat, and generally mealed with them in the kitchen, and altogether led a simple life, little exalted above that of his hind. His sons took their regular share of out-door labour, his wife and daughters attended to the kitchen, spun, managed the poultry and dairy, and were generally the first on the harvest-field. Now, the farmer and his family dress expensively; his duty is to conduct, not to labour with his own hands; he never mingles with his servants unless to direct; his sons are beginning to be educated in those sciences necessary to the perfection of their art; his daughters are taught every accomplishment of modern education, take no share in the labour of the farm, and only attend to such household duties as devolve upon ladies in town. The farmer keeps his thoroughbred horse, or drives his own curricle; attends market as a merchant does the Exchange; transacts his business not as of old with the consumer, but with the cornfactor, thereby saving time, and avoiding expense and trouble. Nay, so perfect is his system of marketing, that, like the clothier and tea-merchant, he can send his samples, his note of weights and prices, and can thus secure every advantage of market without leaving the duties of his farm for a moment. All this speaks of high professional attainment, and betokens an improvement still greater than we can form any idea of, once the physiologist and chemist have made their deductions to bear more directly upon the science of agriculture.

We turn in conclusion to the condition of the farm labourer, the hind, the peasant, the cottager, or by whatever other name the rural section of our population is known. Here we must confess that the picture is not so cheering: this vast improvement in agriculture has told but faintly in comparison on his position, the while it has tended to separate him immeasurably from his employer. The cotton lord who lives in his suburban palace, lolls in his carriage, and dines off silver, is not farther removed from the poor girl who stands at one of his spinning frames, than are some of our modern farmers from the hind that ploughs the soil. This seems to be an inevitable effect of the accumulation of capital, and it were indeed a cheerless and staggering one, had we not faith in human progress towards a condition of less toil and greater comfort. It

must not, however, be supposed that all this recent advance in agriculture has left the labourer in his position of eighty years ago. The draining and treading of the soil have rendered it dry and smooth, and he treads over it more lightly; he has less of rheumatism, and never suffers from ague; machinery has removed in a great degree the necessity of long-continued work and heavy lifts; he is better clothed, and more regularly fed; and on well-managed estates, has a neat and comfortable cottage to dwell in. As improvements proceed, so will his condition be farther improved; every additional appropriation of machinery will lessen his manual labour; and the general advancement of the country will put in his, as in other men's possession, the little luxuries of food and clothing which are so essential to our ideas of comfort. Intellectually, too, he is a superior being; he enjoys a greater amount of freedom; and the expertness he has acquired from moving amid so much improvement and machinery, has fitted him to enter upon other pursuits with greater chance of success than he could possibly have done during the primitive ignorance of a century ago. These are great advantages certainly; and though they do not place the labourer in the proximity to the farmer that existed in former times, still they ought to be regarded as a lengthening of that lever which men, with proper attention, and care, and self-respect, may apply to their own elevation.

Altogether, therefore, it would seem that agriculture, though somewhat later in taking the start, is not in any degree behind the general advance of other industrial pursuits; and that it is every day more closely approximating to them in its modes of operation, in its requirements, and in its results.

BENONI'S MOURNING.

BY FRANCES BROWN.

In the five thousand five hundred and fifty-fifth year of the world, Rabbi Benjamin Benoni, chief doctor of the dispersed of Israel, dwelling in the Gentile city of Granada, made a vow to fast and mourn two days at every full moon for the sins and iniquities of his household.

Rabbi Benjamin Benoni was learned in all the wisdom of the Talmud. He knew to a hair's-breadth how near a Gentile might be approached without pollution, and had written three folio volumes on the proper posture for eating the passover; but the principal exploits of his life was the refutation, in public controversy, of the doctrine maintained by Rabbi Joseph Benjamin Joshua, of Malaga, that it was lawful for a Jew to lift a pin which he saw at his feet on the Sabbath day, which raised his reputation for knowledge and piety to such a height among the Jews of Spain, that they sought his advice and assistance in all difficult cases of conscience, and called him the Solomon of the dispersed. Nor was the rabbi esteemed less righteous than wise. In common with all his people since the Roman ploughshare passed over Zion, he was a man of commerce, and noted for the justice of his dealings with both Jew and Gentile. His zeal against the idolatry of the latter might have rivalled that of the ancient Jehu, had he lived in an age more conducive to its display; but as things were, Benoni had suffered much and often for the faith of his fathers. Born in Poland about the time of his people's banishment from that country by Cassimer the Great, he had early become a wanderer, and persecution had tracked the course of his after years, pursuing him from city to city over the length and breadth of Europe; till, in the sunset of his days, he found a peaceful asylum in the once Moorish, but now Christian city of Granada. Blameless in his life, and most scrupulous in his piety, Rabbi Benjamin Benoni, in the judgment of his people, was entitled to expect every promised blessing annexed to the law of Moses; and some blessings he had received. His business had prospered in every land where he had sought a temporary refuge from Gentile oppression; and his wealth was then believed to exceed that of any

merchant in the city. But a strange affliction had fallen upon the rabbi in his latter days. Of the four children of his youth that grew to years of maturity, there was not one who cared for his age, or loved him as a father: all were gone from him, and he was alone; for the wife of his early choice had died in her summer, and her grave was far away among the hills of Hungary. One was a youth of promise and high hopes, who had become great and famous among the Gentiles for his knowledge of their lore. But he had forgotten his father, and, it seemed, his father's faith also; for he had long ceased to observe the ceremonies of the law, and now dwelt in the city of Salamanca, where he was renowned as a scholar, and much in favour with the Spanish nobility. The other had humbler aspirations. He wedded the maid of his heart, and dwelt in peace among his people, following their path of commerce. Love lit up his hearth, riches increased around him, and men esteemed him liberal and just; yet he never sought the house of his father, nor paused to inquire if it were well with him. The next was a daughter, deemed comeliest among the maids of Israel, fair and stately like the queens of Judah before she was made desolate. But the girl forsook her early faith and kindred for the name and the love of a noble Nazarene, and passed her father on the city streets in all her Christian splendour, as one who dreaded not his wrath, and sought not his friendship. The last was a maiden wise and gentle, but not fair. None had sought her, and she remained unwedded, but left her father in early youth to watch over the orphan children and home of an aged rabbi, and returned to his house no more.

Benoni's heart grew heavy within him as he thought of these things in his lonely chamber. Dust was on his gray locks, and sackcloth was his garment; for it was the time of the full moon, and he mourned, according to his vow, for the great and strange sin of his children. The evening of the second day was come, the hush of the dying twilight had fallen on the great city, and all was silent where the rabbi prayed, looking to the east, the place of morning, and the still promised land to which his fathers had turned through the prayers and wanderings of ages. He prayed long and wept sore; for sorrow was upon him, and he found no comfort. But when the last light was fading, there came a low knock to the chamber door, and a voice of earnest intreaty, which said, 'Benjamin Benoni, for the sake of Jerusalem arise and follow me!'

The rabbi rose astonished, for the voice was strange, and spoke in the old language of the Hebrews, that had long been silent on earth. Without, there stood a man tall and dark, and in the vigour of his years; his garb was of an ancient fashion, his beard long and flowing, and his countenance expressed majesty mixed with sweetness. He beckoned with his hand, and Benoni followed him, though he knew not whither, yet felt as if impelled to go. They left the home of his solitude behind them, and passed through the streets and gates of the city, and then along a great road leading northward, which Benoni, in all his wanderings, had never trod before. It was broad and lonely, and led far away over hill and valley, through forest and desert plain; and by the full bright moon, which shone upon their journey, the rabbi discerned with amazement the long-remembered features of many a far-distant landscape seen in his early journeys: but the ground was smooth beneath his steps, and his feet seemed swift as the wings of an eagle; for he felt no weariness, but journeyed on with that silent guide leagues after leagues, till it seemed to him they had tracked the boundaries of many a Christian realm: they paused at last, where the moon shed her silver rays on the spires of a slumbering city, and the rabbi well remembered the good old town of Pesa-burg.

Midnight lay clear and still on the city of the Magyars; for all its thousands slept, and Benoni's guide conducted him in silence from street to street, till they reached a large but neglected house, whose doors seemed

to open before them; and on entering, the rabbi recognised it as the same which he had occupied twenty years before, when his children were young, and their mother dwelt with him. Benoni would have spoken his surprise, but a spell of silence was upon his lips, and he could utter no sound. The house was still inhabited, but its dwellers saw neither the rabbi nor his guide; though days and nights seemed to pass, and they were with them from hour to hour, marking the manner of their lives at hearth, and board, and prayer. The family were Israelites, and oh how like his own as they once had been! There was a father in the noon of life, a mother fair and gentle, and four young children beautiful and fresh as the first leaves of the vine. Without they had peace, and they felt no want within; yet their home was unhappy; its chambers were solitary and cheerless, for their echoes never woke with the joy of the young, nor the sound of festal gladness: there was a shadow on the mother's beauty cast by unquiet days. The children had sad and thoughtful faces, that told of precocious care; and there were harsh words and fierce disputes that came often among them, as if the thorns of life had grown up early, and choked the flowers of childhood. But Benoni marvelled not; for he saw that the taresower was the high priest of the hearth. The man was one to be well spoken of in the city for grave carriage and integrity; but he sat amid his household as a reprover and a judge, who had no sympathy with their hearts, and no regard to their wishes. None among the doctors of Judah could better interpret the law, and few were more strict in its outward observance; but he made it wearisome to his household by enforcing its thousand ceremonies, and neglecting the 'weightier matters,' which his own example should have taught them by the law of love. Benoni marked the canker working its way to the hearts of the young: he saw the dew of their spring days, the keen relish of life's first enjoyments, that comes no more to those who taste the wormwood, and the blameless desires of childhood, so earnest yet so easily fulfilled, sacrificed day by day to the pride of their father's profitless wisdom, to the folly of his false devotion, and the bent of an evil nature that delighted to rebuke.

The dark seed bore its fruit: the children shunned his presence, and beheld his approach with fear: their laughter died at the sound of his step, and they learned to look upon him as an enemy, whilst round their gentle but simple-hearted mother their gathered affections were twined. She, too, felt her home unblest, and her life weary, for the manner of the husband and father was the same. The tree which she had chosen she found to be a brier. Years of hopeless discontent brought early withering, and at last disease came upon her. She heard the summons of the grave, and grieved not to go, for her wedded life had known no comfort; yet she sorrowed to leave her children, but not to part from the spouse of her youth. He saw his work, but knew it not, for his trust was still unshaken in the power of his vain wisdom and the pride of his long prayers. Benoni grew sad; for, as that fair face faded, its features grew more and more like to those of his lost Jemima, and at length it was her very self. The guide, however, again beckoned him away, and he felt constrained to follow. They left the dwelling and journeyed on; the same great road still stretched before them; but now it wound away like a long river to the west. Again the rabbi found himself passing swiftly through lands traversed before. Many a stately city, the long-desired goal of far-sailing ships and weary caravans; many a dark fortress, that guarded the boundaries of hostile nations, they passed as the wind in its unseen flight; till, fair among her vines, and crowned with the glory of centuries, rose to their view the city of the Seine. The glare of torches and the roll of chariots swept along the never-silent streets, as the gay and noble of the land returned from their long, late revels. Benoni's conductor led him on to a low but open door, far from such scenes, in the quarter inhabited by the sons of toil and Israel.

Well the rabbi knew that house and its narrow chambers, for there, in his wanderings westward, he had once dwelt with his children; but seven long winters had passed over him since then, and days and nights again seemed to glide swiftly by as he and that silent guide beheld the unconscious household. They were the same forms and faces he had seen at Presburg, though changed as if by the march of many years. The children had grown to stately youths and dark-haired maidens; but the mother's glance was wanting, for the light of her love might shine on their path no more. Grayness had come upon the father's locks, and furrows on his brow, but he had learned no lesson from the voice of time: age had only deepened the darkness of his soul, and strengthened in its shadow the love of power and gold. He barred his sons from the love of the Gentile nations, deeming it forbidden, because beyond his knowledge. One was a gifted spirit, strong to think and question, and he despised the faith of Israel because of him who taught it. The other had no gifts, but many graces, and his father esteemed him little, because he had no part in the praise of men. He denied to his daughters the ornaments of youth, and called them sinful vanities; but it was because he valued the smallest coin in his coffers more than the pleasures of his children. Yet he looked with pride on one who walked in beauty; but his glance was cold and careless on her sister, who, though less fair of face, was far more fair in soul. The tares which the old man had planted so early were ripening fast around him; his children already scorned his rebukes, and scarcely heard his counsels, for they had outgrown the fears of childhood, and he had not won the love of their youth: he had made their home solitary, and long habit had rendered them unsocial. Their sphere of society was bounded by each other; and their dwelling was indeed a world to them, but a world which contained in its narrow limits all the evils of the outer earth. The contentions of jarring opinions, the discord of opposing tempers, and the strife of conflicting, though petty interests, banished love and peace from the hearth which should have been their altar—darkened the gray of age, and withered the green of youth.

The rabbi saw, and rejoiced for the gentle mother who had escaped so much in the hush of her early grave; but once more that voiceless conductor beckoned him away from the cheerless dwelling of that joyous city. Their journey was still on the same broad and lonely path towards the place of the setting sun. Swifter still, but still unwearied, Benoni found himself speeding on, rather like one borne upon the waves of a rapid river, than the traveller of the solid earth. But now the way-marks grew more familiar; he knew the white sierras and dark-green woods of Spain, and at last entered at the very gate by which he went forth, the lost but long-beloved city of the Moors. The stranger guided him on through the hushed but well-known streets, till they reached the silence of his own forsaken dwelling. The full moon was still bright above the towers of Granada—though it seemed as if that midnight journey had tracked the course of years—and poured the full flood of her silvery splendour on a solitary chamber where an aged man sat silent and alone. Well the rabbi knew that face, though the furrows were deepened, and the eye dimmed with the shadows of life's closing twilight, since he beheld it last. It was the same he had seen among the children at Presburg and the young at Paris. But the old man's household had gone from him one by one, and left him alone in the winter of his days, like a desert to which the pilgrim desires not to look back; for the place which he filled was the dark spot of their memory. Through all its withering and changes, that form had been to Benoni as one familiar, though without a name; yet now, as he gazed on the forsaken man, the rabbi seemed to be transformed strangely and suddenly as men are in their dreams, till it was himself that stood in the moonlit chamber, with all that weight of solitude and years. 'Benjamin Benoni,' said the

glorious guide, who still stood by him, 'I am the angel of wisdom who guided Solomon in his search for hidden truth. The way which thou hast trodden is the path of memory, in which the steps of the aged wax not slow, nor the eyes of the slumberer dim. By it thou hast retraced the wastes of thy many wanderings; thou hast seen the working of thy boasted wisdom, and looked on the gems of life, the trampled and cast from thee, where they lie far away in the wilderness of time. Learn from these things what sins thou shouldst lament, and tell thy tale, that others may learn from thee.' As the last words fell on the ear of the rabbi, the angel of wisdom passed from his dwelling, and we know not if he ever returned: from that hour Benjamin Benoni mourned no more for the sins of his children, but he sorely mourned for his own.

OCCASIONAL NOTES.

DISINTERESTED LEGATEES.

ABOUT forty years ago, an old man of Scottish birth, who had realised a large fortune in England, and from time to time made purchases of landed property in his native county, died after a protracted life of miserable penury, leaving only collateral relations. These persons had fully expected to be benefitted by their kinsman, so that their surprise was necessarily very great when they learned that he had executed a conveyance of his whole property to a legal practitioner of Aberdeen, who had been accustomed to manage it. It appeared that the old man, under the influence of mere crotchets, or some temporary irritation, had resolved to disappoint them, at the same time that he enriched a man who had no natural claim upon his regard.

The relations had hardly recovered from the first sense of discomfiture, and the friends of Mr C— had scarcely begun to congratulate him upon his good fortune, when he announced to the heirs that he had destroyed the deed, and that the property would consequently pass to them as if the deceased had been intestate. He had with reluctance, he said, consented to allow of the deed being drawn up, and only for the purpose of securing the property for the rightful heirs. These individuals consequently entered upon full possession of the old man's estates and effects. They pressed upon the agent's acceptance a gift of about six thousand pounds, in gratitude for his honourable conduct. It is pleasant to record that he is still living, and a considerable land proprietor in the district where he originally practised as a solicitor or agent.

More recently, a circumstance somewhat similar took place. Two aged sisters were joint-proprietors of an estate in Perthshire. The elder was married, and had a son; the other was unmarried. The elder dying first, her share of the property was inherited by her son, then an officer in the Guards. The second lady, having some groundless dislike to this gentleman, bequeathed her share to a favourite nephew, far down in the family tree, and who had no expectation of such an inheritance. Finding, after the death of the old lady, how the property was destined, this gentleman lost no time in writing to his cousin—a person, we may mention, with whom he was but slightly acquainted, for they had been living at a distance from each other, and were in totally different walks in life—informing him that he could not for a moment think of taking advantage of such a will, but begged to surrender his right, without any reserve, into the hands of the heir-at-law. What added to the merit of this action, the legatee considered the whole matter as a private family affair, and said not a word about it to any besides the party principally concerned. It only became known in consequence of legal proceedings for the transference of the property to the heir-at-law, an opinion from counsel having decided that it was best to proceed upon the will, instead of holding it as null, which was the wish of the legatee.

These examples of a high conscientiousness will be admired by all. They are felt to be the nobler, that public opinion would not have greatly resented a more selfish procedure in either instance. The agent might have appropriated the estate of his client, to the preclusion of the natural heirs, and still more might the junior cousin have sat quietly down in possession of his aunt's property, without forfeiting the esteem of society, seeing that they only did what the law allowed, and what hundreds would have done in their case. We therefore unavoidably accord high praise to their conduct, which we see to have sprung entirely from a genuine integrity and unselfishness of nature. But, it may be asked, is this approbation of such conduct a good sign of the public morality? We fear not, for absolutely the course taken by these two men was precisely what ought to have been taken, and no more. Their conduct only shines by reason of our believing that most men would have acted differently. Let us fully admit, then, the relative merit, seeing that most men feel as if they were well enough if they only act as their neighbours generally do, and any exception from common selfishness argues a superior nature. But still let us also understand that such actions ought not to be rare, nor their merit felt as calling for unusual notice or commendation.

For what are all such eccentric bequests? Are they not in almost all cases the result of mere dotage—not, perhaps, a proveable insanity, but a prave state of the natural feelings arising from age or disease, and dictating a destination of goods which the testator would himself, in an ordinary condition, view with horror? A testator, in such circumstances, is a man at issue with himself. He does now, in his seventieth year, we shall say, what, throughout the previous sixty-nine, he would have condemned in the strongest terms. He, therefore, who takes advantage of the bequest of a testator ascertained to be of this character, may be said to assist him in outraging his own normal feelings, and rendering his name a by-word and a reproach. The part which he acts is little better than that of a man who accepts some costly gift which a child in the simplicity of its heart has offered, not knowing its value, and unrecking that its parents were the true owners. Nor is this all; for all such conduct tends to lower and keep down the standard of the public morality. It gives a disgusting sanction to the maxim of every man for himself, which is the purest essence of barbarism, and tends more than anything else to retard the happiness of mankind.

PUNCTUALITY.

Punctuality to engagements is a species of conscientiousness—a conscientiousness towards our neighbours' time. The gentler sex are sadly deficient in it, probably from their being less accustomed to business arrangements than men. A whimsical friend used to recommend those having appointments with ladies always to go an hour too late. 'You thus have the moderate revenge of keeping them waiting a quarter of an hour, for the three quarters which they would have been sure to keep you waiting, if you had been punctual.'

GUNPOWDER CELEBRATIONS.

Does it never occur to any one that the firing of cannon to mark distinguished events and their anniversaries is far from being a rational practice? What is most objectionable about this folly of the grown-up world, it sanctions similar practices on a smaller scale among boys, who, on several days of every year, are a source of danger both to themselves and others. Many a quiet family are little aware of the gunpowder plot carried on in cellar, closet, or garret, by the male juveniles of their establishment for several days before the royal birthday, or that the son whom they suppose to be at school, or at least enjoying some innocent recreation, is busied in some coarse mob not far from their home firing off pigmy ordnance, squibs, crackers, and other examples

of pyrotechny. Hardly a year passes without its gunpowder victims, and sometimes the spirit of the fireworshippers leads to actual rioting and destructive violence. We must really take leave to doubt that any benefits can be derived from a sulphureous celebration of great days, comparable to the evils which it entails; and we cannot doubt that amusements of a rational and harmless kind could easily be substituted, such as the visiting of museums, zoological gardens, picture galleries, and 'show places' generally. The first step in reform is one belonging to persons in authority: the firing of cannon on such days ought to be given up.

THE GIBBET.

The gibbet has not fifteen years' life in it. If in 1860, fifteen years hence, there shall be a death punishment existing, if we shall still be in this world together, reproach me with being the falsest prophet, the veriest fool, that ever presumed to talk of the advancing spirit of the times.—*Lord Nugent.*

We cordially agree with Lord Nugent, and undertake a share of the hazards to which he here exposes himself.

RESUSCITATION.

The purpose of respiration is to expose the portion of the blood which has returned to the heart, after it has circulated through the body, and which has acquired during that circulation the properties of dark or venous blood, to the influence of atmospheric air in the lungs. The oxygenous portion of the air so received into the lungs converts this venous blood into florid or arterial blood; that is, into a state for being again circulated through all parts of the system. Any interruption to this process—by submersion in water, exposure to choke-damp, strangulation, and the like—if continued beyond a few minutes, is destructive of life. Recovery is, however, possible within certain limits; hence the resuscitative appliances to cases of 'suspended animation.'

The restoratives generally resorted to are warmth, friction, electricity, and, above all, supplying of the lungs with fresh or properly oxygenated air, either by free exposure to an external current, or by artificial injection. The cause of the latter appliance is sufficiently obvious, as the cessation of the heart's action—technically called *asphyxia*—is occasioned by the interruption of respiration, or rather by the interruption of the effect produced by that function on the blood. Any means, therefore, that can restore the process of respiration, or otherwise supply its place, till the action of the heart has been established, must be of value in resuscitation, and especially so where they can be applied with ease and rapidity. Various apparatus have been invented for the injection of common air; but as this fluid contains only about twenty parts in the hundred of pure oxygen, its effect upon the blood in the lungs cannot be so rapid as that of a mixture containing a greater proportion, and still less so than oxygen itself. This gas has accordingly been long recommended; but the difficulty of obtaining it with sufficient rapidity has hitherto proved a barrier to its application. A new mode has, however, been proposed by Dr George Wilson of Edinburgh, by which an unlimited supply can be obtained and administered in a few minutes, and it is to this that we would direct more general attention.

It has been some time known that the chlorate of potash, if mixed with a metallic oxide—such as the peroxide of iron, or the black oxide of manganese—and heated to redness, will give off oxygen in a copious stream, and without any interruption, so long as there is any of that gas in the compound. The proportion of the metallic oxide to the chlorate is a matter of difference among chemists; but Dr Wilson has found by repeated experiment that about one of the former to five of the latter is the most advantageous. We were recently invited to witness in his chemical class-room an exhibition of the apparatus by which he proposes to administer the gas, and which, in the opinion of medical men, is likely to prove efficacious. In this case the supply was

on a limited scale only—some 600 or 800 cubic inches in four minutes—but from the rapidity and certainty with which the gas was produced and administered to a fictitious patient, it left the most favourable impression upon the minds of the spectators. A glass retort containing four or six ounces of the mixture was heated with a spirit-lamp, and in a few seconds the gas began to be evolved, the evolution increasing in rapidity, till at the second minute it flowed over in a continuous stream, and was conveyed into an ordinary telescope gasometer. From this reservoir it was extracted by means of injection bellows fitted with flexible tubes, and then conveyed to the lungs of the supposed patient. This contrivance was next abandoned, and the head of the patient placed in an air-tight box, into which the gas was conveyed from the gasometer. This box was fitted with a glass-slip for watching the changes produced on the countenance of the patient; and the necessary inspirations and expirations were caused by external pressure on the chest, as is done in ordinary cases of administering atmospheric air. Indeed several methods of applying the gas were suggested; but to these we need not advert, as the great merit of the proposal consists in the rapidity with which the supply can be produced and administered. On this head we think Dr Wilson deserving of the thanks of the public, and especially for the pains he has taken in laying it before the medical faculty, the directors of humane societies, and others capable of making the application. Of the individuals who are asphyxiated by submersion, exposure to choke-damp, &c. only a small per centage are resuscitated by the appliances at present in use; but there is every reason to conclude that if a supply of oxygen were obtained by the means above proposed, and kept in readiness at the offices of humane societies and otherwise, the recoveries would be trebled, or even quadrupled. It is agreed on all hands that pure oxygen is more efficacious in asphyxia than common air; and certainly no plan could be more rapid or more economical than that proposed by Dr Wilson.

THE POETRY OF ALFRED TENNYSON.*

Among the assertions most often made in the present day, is one, that the age of poetry is past, or passing. It is said that men are so engrossed with material interests and the struggle for subsistence, that they have little time or inclination to listen to the voices of the poets; and that even if the contrary were the case, they would not prefer the poets of the present day. These opinions have become an article of faith with many, and booksellers especially cling to them with a pertinacity which can only result from conviction. Whether they are right, and whether the age deserves this character, we shall not stop to inquire; we merely allude to the subject, to introduce the name of Alfred Tennyson, and to cite his popularity, either as a great exception to the charge, if it be, generally, a true one, or as a great proof of its falsehood, if it be a false one.

In the year 1830, Mr Tennyson, then a very young man, published a small volume of poems, which met with rather severe treatment from one or more of the most influential reviews. Four years later, he issued another volume, which met a reception as unfavourable. For ten years after this he ceased to publish; his name did not appear in magazines or annuals as a contributor, neither was he mentioned in any way in the catalogues of the publishers. He was not, however, forgotten. During the interval, there had been growing in many minds a sense of his merits: the number so

* This article has been written at our request, in order to convey to our readers some idea of the writings of Mr Tennyson, now rising into repute. Having ourselves had no opportunity of forming an opinion of his merits as a poet, we have to request that our readers will consider the criticism in the present paper as not ours, but that of a gentleman in whose judgment we have general reason to place confidence.—Ed.

affected was constantly increasing: and there existed, in short, a large class of well-informed men, who considered that he was a true poet. In the year 1842 appeared a reprint of the most of his pieces, some having been omitted, in consequence probably of the strictures of the reviewers, and some of them having been slightly altered, together with a series of new poems, the whole forming two small octavo volumes. Without any aid from literary cliques, without any resort to the aids of puffery now so common—arts without which even merit itself hardly appears able to obtain a hearing—these volumes found favour with the public, and in three years have run through as many editions. Suddenly, it has become the fashion to consider Alfred Tennyson as a great poet, if not as the 'poet of the age.' It must be allowed that in these days, when the multitude of competitors renders fame so much more difficult of acquirement than it was in days gone by, there must be rare merit in the writer, who, living apart from the busy world as Mr Tennyson does, and either scorning or being too indolent to employ the machinery by which reputations are partly to be made, has assumed so high a position in the eyes of his contemporaries. A careful study of Mr Tennyson's poems has numbered us in the ranks of his warm admirers; not among that unthinking portion who repeat their praise at second-hand, and who, without knowing why, exalt the object of it greatly beyond his merits, but among those who see in what he has done a very rare excellence, and the promise of still higher achievements, if he will only remain true to his vocation.

Mr Tennyson, we must admit, is inferior to no poet of the present generation; and if we were called upon to state his equal, we should have some difficulty, among the many vigorous spirits whose names are rising one after the other upon the literary horizon, to prove the immortality of the poetic spirit, in pointing out one who has written uniformly so well, and who has proved himself so capable of still greater triumphs.

Those who consider him the poet of the age, have, we think, fallen into a mistake. He may perhaps be the best the age has produced; but the poet whose genius shall reflect and be reflected by this age has yet to make himself known. With all his power and beauty, Mr Tennyson is not that man, if his claim is to rest upon what he has already done. The spirit of this age is that of hope. It is a spirit of action and of enterprise—a spirit of keen inquiry, which would have nothing hidden from its scrutiny either in the present or in the past, the more especially if any lessons can be learned from either for the improvement of the actual, or the attainment of the possible. It is a spirit of energy, of material progress, of free examination—a spirit of movement among the masses of mankind—a spirit from the operations of which we may anticipate, without being over-sanguine, that each successive generation will be wiser and happier than the generation that preceded it. The character of Mr Tennyson's muse is very different. He clings to the memories of the past, and although occasionally his aspirations for the future are elevated and ennobling, they are not so frequent as to form the pervading characteristic of his mind. His muse is one of contemplation more than of action—a muse attuned to the harmonies of nature; sweet, plaintive, and melancholy, with a classical elegance and purity, and a simplicity of loveliness that wins upon every reader the more he studies it. In an age that examines all things, questions all things, experimentalises upon all things, overthrows old systems before it has devised new ones, and whose motto is, 'On—for ever on,' Mr Tennyson anchors his poetical bark upon the traditions of yore, and allows the winds of the present or of the future to blow around him, but not to urge him to any progress. He has a deep knowledge of the human heart, great earnestness of mind, a consummate mastery of the art of versification, and sympathies that are ever on the side of the multitude; but too deeply impressed with the beauty of the classics, and with the exquisitely

poetical mythology of the Greeks, he has become the poet of scholars, and not, as he might have been under a ruder and more comprehensive training, the poet of the people.

The prevailing characteristic of his style is a quaint and quiet elegance, and of his mind a gentle melancholy, with now and then touches of strong dramatic power, the whole coloured by the peculiar scenery of that part of England where he has long resided. Any attentive reader of his poetry, who may have been ignorant that he is a dweller amid the fens of Lincolnshire, would soon suspect this to be the case, when he found such constant pictures of fens and morasses, quiet meres, and sighing reeds, as he so beautifully introduces. We shall not quote as a specimen the beautiful poem of Mariana in the Moated Grange, which must be familiar to most readers, having gone the round of almost all the newspapers and periodicals of the country, although it would exemplify all the points we have stated, but shall mention a few instances from other poems less known. The exquisitely modulated poem of the Dying Swan affords a picture drawn, we think, with wonderful delicacy:—

Some blue peaks in the distance rose,
And white against the cold-white sky
Shone out their crowning mounds.

One willow over the river wept,
And shook the wave as the wind did sigh;
Above in the wind was the swallow,
Chasing itself at its own wild will;
And far through the marsh green and still,
The tangled water-courses slept,
Shot over with purple, and green, and yellow.

The ballad of New-Year's Eve introduces similar scenery:

When the flowers come again, mother, beneath the waning light,
You'll never see me more in the long gray fields at night,
When from the dry dark world the summer airs blow cool
On the oat-grass and the sword-grass and the bulrush in the pool.

In the fragment of an epic on the death of King Arthur full of most mournful beauty, we have—

I heard the water lapping on the crag,
And the long ripple washing in the reeds,

Then quickly rose Sir Bedivere, and ran,
And leaping down the ridges lightly, plunged
Among the bulrush beds.

The barge, with oar and sail,
Moved from the brink like some full-breasted swan,
That fluting a wild carol ere her death
Ruffles her pure cold plume, and takes the flood
With swarthy webs. Long stood Sir Bedivere,
Revolving many memories, till the hull
Looked one black dot against the verge of dawn,
And on the mere the walling died away.

Many similar pictures and expressions might be cited, to show how thoroughly the poet's mind has been tinted by the scenery amid which he has studied. We find constantly throughout the volumes such expressions as 'waste fens,' 'windy fields,' 'glooming fests,' 'sullen pools,' 'sluices with blackened waters,' 'sedges dank,' 'water-lilies, and all the other accessories wanting to complete a Lincolnshire landscape. These expressions, constant as they are, never weary. They are never introduced inopportunately; and they impress the mind of the reader almost as vividly as the objects referred to must have impressed that of the writer, and are besides a relief to the constant sameness of English scenery, as depicted in the pages of other poets.

Another characteristic of Mr Tennyson's style is his beautiful simplicity. Let no one underrate so great a merit. The first poetry of barbarism, and the most refined poetry of advancing civilisation, have it in common. As a specimen of great power and great simplicity, we make the following extracts from his poem on the old legend of the Lady Godiva:—

She sought her lord, and found him where he stood
About the hall, among his dogs, alone.
She told him of their tears,
And prayed him, 'If they pay this tax, they starve.'

Whereat he stared, replying, half-amazed,
*'You would not let your little finger ache
 For such as these?'* *'But I would die,'* said she.
 He laughed, and swore by Peter and by Paul,
 Then flipped at the diamond in her ear:
'Oh ay, oh ay, you talk!' *'Alas!'* she said,
'But prove me what it is I would not do.'
 And from a heart as rough as Esau's hand,
 He answered, *'Ride you naked through the town,
 And I repeat it; and nodding, as in scorn,
 He parted.'*

So, left alone, the passions of her mind—
 As winds from all the compass shift and blow—
 Made war upon each other for an hour,
 Till pity won. She sent a herald forth,
 And bade him cry, with sound of trumpet, all
 The hard condition; but that she would loose
 The people. Therefore, as they loved her well,
 From then till noon no foot should pace the street,
 No eye look down, she passing; but that all
 Should keep within, door shut, and window barred.

Then fled she to her innermost bower, and there
 Unclassed the wedded eagles of her belt,
 The grim ear's gift; but ever at a breath
 She lingered, looking like a summer moon
 Half dipt in cloud: anon she shook her head,
 And showered the rippled ringlets to her knee;
 Unclasped herself in haste; adown the stair
 Stole on; and, like a creeping sunbeam, slid
 From pillar unto pillar, until she reached
 The gateway: there she found her palfrey trapped
 In purple, blazoned with armorial gold.

Then she rode forth, clothed o'er with chastity;
 The deep air listened round her as she rode,
 And all the low wind hardly breathed for fear.
 The little wide-mouthed heads upon the spouts
 Had cunning eyes to see: the barking cur
 Made her cheek flame: her palfrey's footfall shot
 Light horrors through her pulses: the blind walls
 Were full of chinks and holes; and overhead
 Fantastic gables, crowding, stared: but she
 Not less through all bore up, till, last, she saw
 The white-flowered elder thickset from the field
 Glean through the Gothic archways in the wall.
 Then she rode back clothed on with chastity;
 And one low churl, compact of thankless earth,
 The fatal byword of all years to come,
 Boring a little sugar hole in fear,
 Peeped; but his eyes, before they had their will,
 Were shrivelled into darkness in his head,
 And dropped before him. So the powers, who wait
 On noble deeds, cancelled a sense misused:
 And she that knew not, passed; and all at once,
 With twelve great shocks of sound, the shameless room
 Was clashed and hammered from a hundred towers;
 One after one; but even then she gained
 Her bower: whence reissuing, robed and crowned,
 To meet her lord, she took the tax away,
 And built herself an everlasting name.

The ballad of 'Lady Clara Vere de Vere' might also be cited as a specimen of extreme simplicity united with great force; but as it has lately gone the round of the journals, we shall make an extract from a poem less known, and the length of which has saved it from so much newspaper publicity. 'The Talking Oak' is the title of a fanciful and beautiful ballad of seventy-five stanzas, in which a lover and an oak tree converse upon the charms of a sweet maiden named Olivia. The oak tree thus describes to the lover her visit to the park in which it grew:—

*'Then ran she, gamelous as the oak,
 And livelier than the lark,
 She sent her voice through all the holt
 Before her, and the park.'*

*And here she came and round me played,
 And sang to me the whole
 Of those three stanzas that you made
 About my "giant bole."*

*And in a fit of frolic mirth,
 She strove to span my waist;
 Alas! I was so broad of girth,
 I could not be embraced.*

*I wished myself the fair young beech,
 That here beside me stands,
 That round me, clasping each in each,
 She might have looked her hands.*

*'Oh muffle round thy knees with fern,
 And shadow Summer chase,
 Long may thy topmost branch discern
 The roofs of Summer place!'*

*But tell me, did she read the name
 I carved with many vows,
 When last with throbbing heart I came
 To rest beneath thy boughs?'*

*'Oh yes; she wandered round and round
 These knotted knees of mine,
 And found, and kissed the name she found,
 And sweetly murmured thine.'*

*A tear-drop trembled from its source,
 And down my surface crept;
 My sense of touch is something coarse,
 But I believe she wept.*

*Then flushed her cheek with rosy light;
 She glanced across the plain,
 But not a creature was in sight—
 She kissed me once again.*

*Her kisses were so close and kind,
 That, trust me, on my word,
 Hard wood I am, and wrinkled rind,
 But yet my sap was stirred.*

*And even into my innermost ring
 A pleasure I discerned,
 Like those blind motions of the spring
 That show the year is turned.*

*I, rooted here among the groves,
 But languidly adjust
 My rapid vegetable loves
 With others and with dust;*

*For ah! the Dryad days were brief
 Whereof the poets talk,
 When that which breathes within the leaf
 Could alip its bark and walk.*

*But could I, as in times foregone,
 From spray, and branch, and stem,
 Have sucked and gathered into one
 The life that spreads in them,*

*She had not found me so remote;
 But lightly issuing through,
 I would have paid her kiss for kiss,
 With usury thereto.'*

*Oh flourish high with leafy towers,
 And overlook the sea;
 Pursue thy loves among the bowers,
 But leave thou mine to me.*

*Oh flourish, hidden deep in fern:
 Old oak, I love thee well;
 A thousand thanks for what I learn,
 And what remains to tell.*

The poem of 'Saint Simeon Stylites' is of another character, and portrays the spiritual pride of an ancient fanatic, with a simple and savage grandeur of words and imagery which we have never seen surpassed. It is too long for entire quotation, but the following extracts will show its beauty:—

*Although I be the basest of mankind,
 From scalp to sole one slough and crest of sin;
 Unfit for earth, unfit for heaven, scarce meet
 For troops of devils mad with blasphemy,
 I will not cease to grasp the hope I hold
 Of saintdom, and to clamour, mourn, and sob,
 Battering the gates of heaven with storms of prayer—
 Have mercy, Lord, and take away my sin.
 Let this avail, just, dreadful, mighty God;
 This not be all in vain; that three ten years,
 Thrice multiplied by superhuman pangs
 In hunger and in thirst, fevers and cold;
 In coughs, sores, stiches, ulcerous throes and cramps;
 A sign betwixt the meadow and the cloud,
 Patient on this tall pillar I have borne
 Rain, wind, frost, heat, hail, damp, and snow;
 And I had hoped that ere this period closed,
 Thou wouldst have caught me up into thy rest,
 Denying not these weather-beaten limbs
 The meed of saints—the white robe and the palm.*

*Oh! take the meaning, Lord: I do not breathe,
 Not whisper any murmur of complaint.
 A pain heaped ten hundredfold to this were still
 Less burden, by ten hundredfold, to bear
 Than were those lead-like tons of sin, that crushed
 My spirit flat before thee.*

*Oh Lord, Lord!
 Thou knowest I bore this better at the first;
 For I was strong and hale of body then,*

And though my teeth, which now are dropt away,
Would chatter with the cold, and all my beard
Was tagged with icy fringes in the moon,
I drowned the whoopings of the owl with sound
Of pious hymns and psalms, and sometimes saw
An angel stand and watch me as I sang.

Good people, you do ill to kneel to me.
What is it I have done to merit this?
I am a sinner viler than you all.
It may be I have wrought some miracles,
And cured some halt and maimed; but what of that?
It may be no one, even among the saints,
May match his pains with mine; but what of that?
Yet do not rise; for you may look on me,
And in your looking you may kneel to God.
Speak, is there any of you halt or maimed?
I think you know I have some power with Heaven
From my long penance: let him speak his wish,
For I can heal him. Power goes forth from me.
They say that they are healed. Ah, hark! they shout
'Saint Simeon Stylites.' Why, if so,
God reaps a harvest in me.
It cannot be but that I shall be saved,
Yea, crowned a saint. They shout 'Behold a saint!'
And lower voices saint me from above.
Courage, Saint Simeon; this dull chrysalis
Cracks into shining wings.

Oh, my sons, my sons!
I, Simeon of the pillar, by surname
Stylites among men—I, Simeon
The watcher on the column till the end—
I, Simeon, whose brain the sunshine bakes—
I, whose bald brows in silent hours become
Unnaturally hoar with rime—do now,
From my high nest of penance, here proclaim
That Pontius and Iscariot by my side
Showed fair like seraphs.

While I spake then, a sting of shrewdest pain
Ran shrivelling through me, and a cloud-like change
In passing, with a grosser film made thick
These heavy, horny eyes. The end! the end!
Surely the end! What's here? a shape, a shade,
A flash of light. Is that the angel there
That holds a crown? Come, blessed brother, come!
I know thy glittering face. I've waited long!
My brows are ready! What! I deny it now?
'Tis gone—'tis here again: the crown! the crown!
So, now, 'tis fitted on, and grows to me,
And from it melt the dews of Paradise.

Speak, if there be a priest, a man of God
Among you there, and let him presently
Approach, and lean a ladder on the shaft,
And climbing up into mine airy home,
Deliver me the blessed sacrament;
For by the warning of the Holy Ghost
I prophesy that I shall die to-night
A quarter before twelve.

But thou, oh Lord,
Aid all this foolish people: let them take
Example, pattern—lead them to Thy light.

One more extract from the 'Lotos Eaters' will give a specimen of our poet's exquisite modulation of rhythm. This poem represents the luxurious lazy sleepiness of mind and body supposed to be produced in those who feed upon the lotos, and contains passages not surpassed by the finest descriptions in the *Castle of Indolence*. It is rich in striking and appropriate imagery, and is sung to a rhythm which is music itself.

Why are we weighed upon with heaviness,
And utterly consumed with sharp distress,
While all things else have rest from weariness?
All things have rest. Why should we toil alone?
We only toil, who are the first of things,
Now, make perpetual moan,
Still from one sorrow to another thrown.

Lo! in the middle of the wood
The folded leaf is wooed from out the bud
With winds upon the branch, and there
Grows green and broad, and takes no care,
Sun-steeped at noon, and in the moon
Nightly dew-fed; and turning yellow
Falls and floats adown the air.
Lo! sweetened with the summer light,
The full-juiced apple, waxing over mellow,
Drops in a silent autumn night.

All is allotted length of days;
The flower ripens in its place,
Ripens, and fades, and falls, and hath no toil,
Fast-rooted in the fruitful soil.

Let us alone. Time driveth onward fast,
And in a little while our lips are dumb.
Let us alone. What is it that will last?
All things are taken from us and become
Portions and parcels of the dreadful past.
Let us alone. What pleasure can we have
To war with evil? Is there any peace
In ever climbing up the climbing wave?
All things have rest, and ripen towards the grave;
In silence ripen, fall, and cease;
Give us long rest or death, dark death, or dreamful ease.

How sweet it were, hearing the downward stream,
With half-shut eyes ever to seem
Falling asleep in a half-dream!
To hear each other's whispered speech;
Eating the lotos, day by day;
To watch the crisping ripples on the beach,
And tender curving lines of creamy spray;
To lend our hearts and spirits wholly
To the influence of mild-minded melancholy;
To muse and brood, and live again in memory
With those old faces of our infancy,
Heaped over with a mound of grass,
Two handfuls of white dust, shut in an urn of brass.

We have not space for further extracts, but the beauty of these will show that Alfred Tennyson has not acquired fame without deserving it, and that he is not to be classed among the mob of mere verse-mongers, whose pertinaacious pretensions are often a sore discomfort to the critic in the present day. Among his other pieces, we must mention the names of a few, which abound in beautiful passages, and are excellent both in design and execution. Of these our principal favourites are, 'The Two Voices,' 'Locksley Hall,' 'The Vision of Sin,' and 'Ænone.' The first-named is perhaps the finest specimen of verification in the volumes: the thoughts are noble in themselves, and nobly expressed, and the argument is worthy of the high strain in which it is sung. The Two Voices are the conflicting opinions in the breast of a man who is half inclined to be weary of the load of existence, and to throw it off; and hope and despair, certainty and doubt, are pitted against each other to decide the great question of the value of existence. The victory in the argument is given at last where it ought to be given; and the man walks forth on a Sabbath morning into the fields, reconciled to himself and to his kind, and wondering, amid the beauties of nature, how he could have ever communed with a voice so barren as that of despair. Locksley Hall is a bold original ballad, constructed in a metre somewhat unusual and cumbersome at first sight, but wonderfully pliant and musical in the hands of our author; in which a lover having been jilted by a false lady, repels her memory from his heart with bitter scorn, and goes over the whole catalogue of possible excitements into which he may rush to forget her for ever, and at the same time give the world an impetus in the onward career of improvement. The poem is far too long for quotation; but any reader who may not have seen it, and who may be tempted by our praise to read and study it, will find it a masterpiece, and be convinced by every stanza that none but a poet of high and original powers could have produced it. The Vision of Sin is chiefly remarkable for the exquisite art displayed in the verification of the introductory passage, and the skilful harmonising of sound to sense, showing how thoroughly the author has studied the art of poetry; and what power is in him, if he would but wield it; whilst Ænone is full of melancholy beauty and classic dignity.

In conclusion, we must express our hope that ere long English literature will again be enriched with a new volume from the pen of this author. Though not yet the poet of the age, he may perhaps become so. To reach this eminence, however, he must not linger too much upon the memories of the past; neither must he eat of the lotos, nor stray in the gardens of the *Castle of*

Indolence, in which we hear he takes more delight than becomes a man so gifted as he is. Whenever he does again appear before the world, a hearty welcome will greet him in every circle where poetry is still appreciated.

CROSSING THE ATLANTIC.

SOME weeks ago we had the gratification of inspecting that wonder of modern ship-building, the Great Britain; but before we describe the interesting things we then saw, it may be advisable to give a general account of the rise and progress of steam navigation across the Atlantic.

Before the first steamer made its way over the 3000 miles of sea which divides us from New York, communication was chiefly maintained by a fleet of sailing vessels—most of them built in America—called 'liners,' from their keeping up a regular line of communication between the two countries. They are considered, for fast sailing and skilful management, amongst the best ships on the high seas, taking on the average only thirty-two days to cross the Atlantic with heavy burdens. Yet, despite their general merits, they were liable, through the same causes that worse ships suffer from, to vexatious delays. During the stormy winter of 1836-1837, west winds prevailed with such strength and constancy, that for six weeks all the liners which started from the British ports were baffled by contrary winds, and at one time no fewer than eighteen mails were due at New York. Such delays were productive of something more than commercial inconvenience. In unusually protracted voyages, the passengers suffered extremely from want of food. So late as February 1837, the British ship *Diamond* arrived at New York from Liverpool, having been 100 days from port to port. There were 180 passengers, of whom 17 died, not from any disorder, but from mere starvation. The principal suffering was among the steerage passengers, the crew having been put upon allowance, and supplied to the last with food, though in small quantities. The description of the appearance of these poor wretches on their arrival, given by an eye-witness, is heart-rending. One man lived nine days on potato-peelings soaked in his scanty allowance of water; although, for any ordinary voyage, the supplies were abundant. Some, who had extra quantities, sold their stock of food to their less provident fellow-passengers, first at moderate rates, but, as the scarcity more fully developed itself, at enhanced prices, until finally half a sovereign was asked for a pint of meal. Before the arrival of the vessel, a sovereign had been offered and refused for a potato, as it was roasting before the fire.

The amount of commercial disaster arising from the frequent but unforeseen delays of sailing vessels may be judged of from the fact, that during 1837 a general break-up took place among the American merchants in London, solely occasioned by the ruthless winds, which kept back their ships and remittances.

It was natural, therefore, that steam should be earnestly looked to as a means of mitigating, or, if possible, of obviating such disastrous delays. Some such effort was in reality demanded, by the rapid increase of commerce between Great Britain and America.* Steam had long been most advantageously employed in river and coast navigation, though no successful voyage had been made across the main.

When it was first proposed to send a steam-vessel across the Atlantic, scientific men, who were looked up to as authorities on the point, declared that, if attempted, it would be found impracticable. Despite this opinion, however, some spirited merchants of Bristol determined to try the experiment, and forthwith laid down the

hull of a steamer, which it was their intention to send over the ocean at all hazards. While the ship was being built, it happened that the British Association for the Advancement of Science met at Bristol, and one of its members demonstrated theoretically that a steam voyage direct to New York would be quite impracticable. And here we shall take leave to relate a story quite in point to this unfulfilled prophecy:—An English nobleman, who was staying in France, proposed to run his fleetest race-horse against time. The savants immediately set to work to calculate whether the feat were possible or not. They reckoned the volume of air the horse should displace at each bound, multiplied the weight of this by the necessary velocity, ascertained the strength of the horse by a dynamometer—and, putting w for the weight, v for the velocity, and p for the power, proved, without running far into the calculation, that the achievement was impossible ($w \times v > p$). The Englishman was puzzled, admitted the demonstration to be irrefragable, but nevertheless ran his horse—and won!

This was nearly what happened to the Great Western and her premature critics. The mathematician alluded to computed that, for each horse-power of steam, one ton of coals would be required for every 1425 miles. 'Taking this as a basis of the calculation,' said he, 'and allowing one-fourth of a ton of coals per horse-power as spare fuel, the tonnage necessary for the fuel and machinery on a voyage from England to New York would be 370 tons per horse-power, which, for a vessel with engines of 400 horse-power, would be 1480 tons.* Now, as the ship referred to was only intended to be 1200 tons' burden, the voyage was demonstrably impracticable.

The owners, however, placed more confidence in the practical skill of their engineers and ship-builders, than in the theoretical calculations of the philosopher. The ship was completed, and proved to be of the following dimensions:—Length of deck 230 feet; breadth, including paddle-boxes, 58 feet 4 inches; depth of the hold 23 feet; the vessel, when laden, drawing 16 feet of water. The paddle-wheels were 28 feet in diameter, each paddle-board being 10 feet long. There were two engines, of 225 horse-power each, weighing together 200 tons; the boilers—of which there were four—100 tons additional. Instead of 1200 tons, as at first intended, the tonnage had been increased to 1340 tons. The total cost of the ship was about £63,000. When ready for sea, she was freighted; seven adventurous persons became passengers; and on the 8th of April 1838, the Great Western started from Bristol to solve the great problem of ocean steam navigation.

A few matches from the journal of one of the passengers were published in the Quarterly Review.† From them we learn that the new steamer had only been three days at sea when she overtook a brave old 'liner,' which had sailed from Liverpool seven days earlier, 'careering and plunging to a lively foam and a fair wind.' The Great Western dashed a-head, soon leaving the sailing-vessel astern. The new wonder of the deep continued her voyage without interruption, and arrived off New York on the afternoon of St George's day, having performed the voyage in the unprecedentedly short space of 15 days and 10 hours, without let or hindrance, and with several tons of coals to spare.

It is necessary to state here, that three days before the Great Western set out, the *Sirius*—a steamer which usually plied between London and Cork—was despatched, and arrived on the morning of the same day (23d of April). The wharfs and shores within view of New York harbour were crowded with thousands of spectators who had welcomed the arrival of the *Sirius*, and tarried anxiously for the approach of the Great Western. They had not long to wait, for a few hours after the *Sirius* had dropped anchor, a long trail of smoke was seen in the distance, and the hull of the expected steamer appeared. The sight afforded to those on board the Great Western was peculiarly exciting. From the time of her crossing the bar of the harbour,

* Of the total produce and manufactures exported from Great Britain and Ireland in 1836 (valued at £53,368,579), as much as was declared to be worth £12,485,605 sterling went to the United States—that is to say, the Americans were our customers to the extent of above 23 per cent. of our entire exports for that year!

* Report of Proceedings of British Association.—*Albion*, vol. ix. p. 656. See also *Edinburgh Review*.

† Volume liii.

all her 'poles' were set aloft, and flags gaily streaming at each—the foreign ensign at the gaff, and at the fore a combination of the British and American. 'At 3 p.m.' continues the passenger above referred to, 'we passed the Narrows, opening the bay of New York, sails all furled, and the engines at their topmost speed. The city reposed in the distance, scarcely discernible. As we proceeded, an exciting scene awaited us. Coming abreast of Bradlow's Island, we were saluted by the fort with twenty-six guns (the number of the States): we were taking a festive glass on deck. The health of the British Queen had just been proposed, the toast drunk, and, amid the cheers that followed, the arm was just raised to consummate the naming, when the fort opened its fire. The effect was electrical—down came the colours, and a burst of exultation arose, in the midst of which the President's health was proposed. The city now grew distinct: masts, buildings, spires, trees, streets, were discerned; the wharfs appeared, black with myriads of the population hurrying down, at the signal of the telegraph, to every point of view. And then came shoals of boats—the whole harbour covered with them. And now the new-comer reaches the Sirius, lying at anchor in North River, gay with flowing streamers, and literally crammed with spectators—her decks, paddle-boxes, rigging, mast-head high. We passed round her, giving and receiving three hearty cheers, then turned towards the Battery. Here myriads again were collected: boats crowded round us in countless confusion: flags were flying, guns firing, and bells ringing. The vast multitude set up a shout—a long enthusiastic cheer—schoed from point to point, and from boat to boat, till it seemed as though they never would have done.'

So much for the first transports; and after them a little dry investigation into the wherefore of two ships crossing the broad Atlantic in defiance of mathematical calculation, will not come amiss. On examination, it turned out that, although the computations were correct enough, the scientific men were out in their date. The voyage did not require nearly four tons of coals per horsepower, as was proved by the consumption on board each vessel. The Sirius carried no more than 453 tons of coals; but she was also provided with 43 barrels of resin, which is said to equal 21½ tons of coals. On taking stock at New York, it was found that 22 tons of coals were still on board. Instead of the 1480 tons which it was predicted the Great Western would have to burn, she took out less than half that quantity (660 tons), of which 450 tons only were consumed! The distance she had run was 3111 nautical miles.

The Great Western having remained a fortnight in harbour, started on her homeward voyage on the 7th of May, when, at the lowest computation, one hundred thousand New Yorkers turned out to witness her departure. Sixty-six passengers had now courage to venture in her. After steaming for exactly a fortnight, and over 3218 nautical miles, she arrived at Bristol on the 29th of May. An immense multitude assembled to welcome her back into the 'king's road,' which they did with tremendous cheers. To show some of the results to be expected from this approximation in point of time of the two continents, one of the passengers, on landing, presented a splendid bouquet of American flowers to the lady of Captain Claxton, the manager of the Great Western Steam Navigation Company. They appeared as fresh as if the dew had been still on them. At a grand dinner of the Bristol citizens two days after, specimens of flax and cotton yarn were exhibited, the raw material of which had been shipped eighteen days previously, and manufactured in a recently-established mill in Bristol.

Thus the great problem of crossing the Atlantic by steam was solved, in spite of the winds, the waves, and the philosophers. 'But this is only one voyage,' said the sceptics; 'let us see the effect of the enormous wear and tear the Great Western will have yet to encounter.' That has been tested, and the result is as follows:—Between the 8th of April 1838, and the 23d of November 1844, she performed seventy passages, in the course of which she had run 256,000 statute miles, at an average speed of

a fraction more than ten miles per hour.* She had conveyed 5774 passengers, besides an immense quantity of goods: she had not been favoured by the weather, that having been in some instances severely stormy: she has not met with any serious accident: yet we learn from the report of a surveyor appointed by government to examine her, and from the frequent reports of the Surveyor-General at Lloyd's, that she is as sound in material, and as perfect in form, as on the day she was launched.

When the practicability of this long voyage was fully established, other vessels were speedily put on the same track. The Sirius, having come back in safety, was replaced on her own station, between London and Cork; but was succeeded by the Royal William, which, however, only made a few voyages, and was likewise placed on another passage. In 1836, a British and American Steam Navigation Company was formed in London, and built a steam-ship of larger dimensions than the Great Western, at an expense of £100,000, calling her the British Queen. Her burthen in tons was 2016. She sailed from Portsmouth on the 12th July 1839, and reached New York in 15½ days. Although she performed so well, that in the year 1840 she made five voyages to, and five from, New York, yet, from want of patronage, the company resolved, in 1841, to sell her, which they did to the Belgian government. The vessel which this company built to succeed her brings us to the most melancholy passage that occurs in the history of steam navigation. She was called the President, and registered to carry 2000 tons. In 1840 she made two complete voyages from an' back to Liverpool, without any material accident.

In April 1841 the President left New York for Liverpool, with thirty passengers on board, and up to this day no satisfactory intelligence has been received regarding her fate. Her non-arrival at the usual time caused great excitement in this country; and for days and weeks, and even months, it was conjectured that she might have been driven by stress of weather to the Bermudas, or to some other islands in the Atlantic Ocean. Some thought that she might have been forced on the coast of Africa; others that she had been struck by an iceberg; but the general opinion was, after months of anxious expectancy, that she had foundered at sea during the very severe gales which then prevailed. It was remarkable that no vessel had spoken with her on such a well-frequented route as the Atlantic. The only ship that reported having seen any craft like the President was a Portuguese brig, which, on 23d April 1841, while in latitude 51 degrees north and longitude 49 degrees west, or about the middle of the Atlantic, saw a very large steamer under sail, going at the rate of three or four miles an hour. No smoke issued from the funnel, and the paddle-wheels were not in motion. The captain of the brig saw the steamer both on that and the following day, and even approached within three or four miles of her while pursuing his own homeward route. She did not hail the brig, nor did she appear to be at all in a disabled state. A British man-of-war and two Portuguese vessels were sent to cruise in search of the President, but without success; and all hope for her safety was abandoned.

The prevailing conjecture is, that she 'broke her back,' that is, had been severed in the middle in a violent storm which raged while she was at sea, and that she must have sunk bodily at a moment's warning.

A third company was formed in Liverpool, called the Transatlantic Steam Navigation Company, in whose service there are at present five vessels employed to sail between various parts of North America and Liverpool. They are named the Britannia, the Caledonia, the Hibernia, the Cambria, and the Acadia. All these ships were built in the river Clyde, and are of the same model and dimensions, carrying engines of 500 horsepower, and burdens of 1200 tons. To them the government intrusts the transmission of the mails to the United States and Canada, for which it pays the Transatlantic

* Till the year 1844, the Great Western sailed from Bristol; since then, her port of departure has been Liverpool.

Company £80,000 per annum. Except two rather severe accidents to the Caledonia, which happened respectively in May 1842 and the 2d July 1843, nothing has occurred to these vessels to prevent their regularly fulfilling their engagements to the post-office and the public. They sail twice each month from the beginning of April to the end of November, and once during December, January, February, and March.

Meanwhile, the Great Western continues her voyages, and keeps up her fame, having her glory brightened rather than dimmed by competition with rivals. The spirited company to which she belongs have recently made another bold experiment. They have built an iron ship, which is a hundred feet longer than a first-rate man-of-war, and is propelled without side-paddles. She was named the Great Britain—a visit to her we intend to describe in a succeeding paper.

STRUGGLES OF YOUTH, IN THE CASE OF JAMES CORSON.

It has often been said that an earnest desire, steadily persevered in, is sure to bring about in time its own accomplishment, however improbable such an event may appear at first; and there has perhaps rarely occurred a more striking proof of there being some truth in this remark than in the following history.

It was the earnest wish of James Corson, when a boy of little more than seven years of age, to be a 'doctor' in England; and certainly when the wish was first uttered, there appeared very little prospect of its accomplishment. The father of the boy, who was gardener to a gentleman at Dalscairth, in Dumfriesshire, had a large family, with so small a salary, that he could scarcely spare his boys to attend the parish school; and it was with a heavy heart that 'Jamie' was often compelled to leave his books to attend to the manual labours in which his father found it necessary to employ him. When he was ten years of age, however, a heavier blow fell upon him. His father left Dalscairth, and took a situation in Yorkshire, where, as he found education much dearer than in Scotland, he was no longer able to send James to school. Still, however, the boy remained unshaken in his determination to be a doctor in England; and he spent every leisure moment in poring over his books. His perseverance and his ambition began to attract the notice of the house servants of the gentleman with whom the elder Corson was gardener. He excited a particular interest in the butler, who, being a great favourite with his master, easily obtained permission to take the boy into the family as his assistant. This step, however, at first was the occasion of pain rather than pleasure to James, as his fellow-servants, who had heard of his ambitious desires, never ceased jeering him about them; and indeed the contrast they afforded to his actual situation was sufficiently striking. He was now about fourteen, tall, and well grown for his age, but shy and awkward in his manners, and speaking with a strong Scotch accent, which the Yorkshiremen, though they perhaps speak worse English than is met with in any other county, were particularly severe upon. The jeering of his companions, however, had no other effect on James Corson than to give him another object for his ambition, for he now determined that he would conquer his Scotch accent, and learn to speak pure English, which he did do in the end.

James Corson, during the four years that he remained as assistant to the butler, contrived, with that person's assistance, to perfect himself in writing and accounts; and as he never omitted any opportunity that occurred of acquiring knowledge, he was able, when he left Yorkshire, to take the situation of usher in a school in Wigtonshire. Here he stayed two years, during which he learnt Latin and Greek, and the rudiments of French; but as his salary was very small, he took the first opportunity that occurred of removing to Whitehaven, where also he was usher in a school. In both these situations he saved all the money he could, in the hope

that he might at last realise the project that had never once been absent from his thoughts.

At Christmas 1835, James Corson left his situation at Whitehaven, and returned to his father's cottage, previously to visiting London, where he had at last determined to push his fortune. He found, however, upon inquiry, that what he possessed would be nothing in London, and would but barely maintain him there while he was studying as a surgeon, without leaving him any money to pay the fees. This information depressed his spirits exceedingly, and when he returned home, after consulting with a friend at Leeds, he told his father that he began for the first time to fear his wishes never would be accomplished. The elder Corson took in the Gardeners' Magazine; and as it was lying on the table, James listlessly opened it, when his attention was caught by an advertisement for an amanuensis, which had been inserted by Mr Loudon for himself. The countenance of the young man brightened up, and he exclaimed, 'Then I'll see London at last!' His father and friends laughed at him, and argued the improbability of his succeeding in obtaining the situation. But his presentiment had been right; and though Mr Loudon had about a hundred and thirty answers to his advertisement, James Corson's letter was so well expressed, and written in such a manly, yet modest style, that he was preferred. It may easily be conceived that young Corson's delight, when he received Mr Loudon's letter, was beyond description. His father says he was wild with joy.

Mr Loudon at that time was engaged in writing his great work, the Arboretum Britannicum; and as he had also three magazines appearing monthly, a great many persons were employed in his office; but of these Mr Corson only became intimate with two; namely, Mr Ranch, a young German, who was one of the draughtsmen, and Mr W. Baxter, son to the curator of the botanic garden at Oxford, who was an amanuensis. Mr Corson's salary was a pound a-week, for which he was engaged in Mr Loudon's office from eight in the morning till six, and he had to find his own lodgings and food, with the exception of some bread and cheese and beer, which all the young men had at one o'clock. Notwithstanding his moderate salary, and the length of time he was occupied every day, young Corson now saw all his wishes on the point of being realised, and he immediately entered a class of students in surgery with a Mr Demott of Charlotte Street, Bloomsbury. He found, however, that, to enable him to pay the fees out of his small salary, it would be necessary for him to practise the most rigid economy; and he accordingly ate nothing but oatmeal porridge, which he made himself, in addition to the very moderate lunch which he ate at Bayswater. To increase his funds, he also took in writing to do at night, after he had finished his medical studies. A very strong constitution, and the most determined perseverance, enabled him to continue these exertions for two years; during the whole of which time he never took a single day's pleasure, or indulged himself with more than four hours' sleep in each night. It may also be added, that during this period, notwithstanding the severity of his medical studies, he never neglected in the slightest degree Mr Loudon's business; and that he always stayed his full time, of from eight till six, in the office at Bayswater, where his indefatigable industry, joined to his quiet and amiable disposition, rendered him a general favourite.

Few young men who have studied surgery under the most favourable circumstances have ever passed their examination with more credit than Mr Corson; and he was even praised by the examining surgeons for the very great care and attention with which he gave his answers. He had now so far attained the long desired object of his ambition, that he was a surgeon in England; but he was at a loss how to turn his newly attained honours to account, as he had no money to purchase a business, or even to fit up a surgery. In this dilemma Mr Ranch, the young German, with whom Mr Corson had formed an acquaintance at Mr Loudon's,

came to his assistance, and detailed the circumstances of the case to a friend, who happened to be a ship-owner. 'I have no interest in the medical line on land,' said this gentleman; 'but if the young Scotchman does not object to the sea, I think I could get him appointed surgeon to a South-Sea whaler; and if he is careful, he may possibly save L.70 or L.100 out of his pay during the three years the ship will be on her voyage, and that will be enough to set him up as a surgeon anywhere.' It may easily be conceived that Mr Corson made no objection to the sea, and, in fact, he sailed with Captain Benson, master of the *Kitty*, in the autumn of 1838.

Up to this time all had gone well with Mr Corson. He had succeeded in everything he undertook; and he had so nearly attained the summit of his ambition, that even those who had laughed at his projects as wild and impracticable, were now compelled to own that all he had wished for lay almost within his grasp. The voyage out of the whaler was also highly successful; and Corson not only fulfilled all the ordinary duties of his situation most satisfactorily, but on one occasion, when a seaman had had his leg lacerated by a shark, he had performed amputation in a masterly manner. Half the voyage had been performed, and they were on their road homeward. Corson had made a collection of plants for Mr Loudon, and of shells, partly for his kind friend Mr Rauch, and partly for Mrs Loudon; and he had, besides, saved upwards of L.70 towards the L.100 he was to accumulate.

The remainder of the tale is soon told. While in the tropics, Mr Corson had occupied himself in clearing the shells he had collected from the animals they contained; and from fatigue, or perhaps from the noxious effluvia evolved by the decaying animals, he was taken ill of fever, which carried him off in fourteen days. He died on the 16th of June 1841, in the twenty-seventh year of his age, a striking illustration of what may be done by industry and perseverance.

[It will be understood that the proceedings here detailed are not held up as an example to be followed, but only as a remarkable instance of the pursuit of knowledge under difficulties. Mr Corson's application to duty and study was so far beyond what our natural powers justify, that it is surprising he did not sink under it. His not doing so may be attributed to an unusually vigorous constitution. All ordinary endowed persons must be in the greatest danger from such over-taskings; and even of those who are constituted most favourably, the greater number would fail to survive such a course as that passed through by Mr Corson while studying for his profession.—ED.]

ORIGIN OF THE TERM 'MERRY ANDREW.'

This term, with which every child out of the nursery is so familiar, and which is inseparably associated with his ideas of grins, grimaces, and humorous sayings, has a much more exalted origin than many may suppose. The medical profession, which has given rise to more nicknames and slang phrases than almost any other, has the paternity of this one also to answer for. During the time of Henry VIII., Edward VI., and Queen Mary, there lived and practised as a physician in London one Andrew Borde, who to his vast learning and knowledge of foreign parts, added the most whimsical and facetious characteristics. This individual was originally a Carthusian monk, but the severities of the order being rather inconsistent with his irrepressible propensity to humour, he abandoned the brotherhood, and betook himself to physic. After travelling the European continent and some parts of Africa, he settled in the metropolis, where he became a physician to Henry VIII., and author of several works on medicine, poetry, and literature. 'He was a man,' says a contemporary, 'and of a whimsical head; he frequented fairs and markets, and harangued the populace in public; he made humorous speeches, couched in such language as caused mirth, and wonderfully propagated his fame.' From his use of such speeches at markets and fairs, he came to be better known as Merry Andrew than as Dr Borde; and thus those who in after times imitated the same humorous jocular language were styled

'Merry Andrews.' Though weak in these respects, he is otherwise acknowledged to have been a learned man, a good poet, and perhaps the best physician of his time. He was the author of the *Merry Tales of the Wise Men of Gotham*; the *Introduction to Knowledge*, a poem; the *Miller of Abingdon*; the *Principles of Astronomical Prognostications*; the *Doctrine of Health*; the *Promptuary of Medicine*; a book of jests; and other pamphlets. Dr Borde died a prisoner in the Fleet, April 1549; yet, it is said, not for debt, as he left considerable inheritance behind him. The conduct of Merry Andrews conveys to us certainly no very exalted notion of the medical profession three hundred years ago; though, all other progress considered, it was not then one whit more degraded by Borde and his brethren with their mountebanks, than it is now by the quacks and pill venders who batten on the credulity of the public.

AN AVIARY ON A GREAT SCALE.

It is a pleasing thing to witness, says a correspondent of the *Zoologist* for March, the confidence and familiarity of the nightingale when protected; as, for instance, in the promenade at Gradenfeld, in Prussia, a beautiful planted piece of ground, extending nearly a quarter of a mile along both banks of a small stream. In addition to the penalties denounced by Prussian law against those who rob the nests of the nightingale, a watchman is stationed here during the breeding season for additional security. This may perhaps appear singular in our matter-of-fact age; but I am confident that no lover of nature who had resided in Gradenfeld, and enjoyed the delicious concerts which these birds maintain both day and night, except from about two to five o'clock P.M., would refuse his aid to such a custom. Many a bird-fancier is at much greater expense, not to speak of trouble, in keeping a ghost of a nightingale caged, and why should we wonder at the inhabitants of Gradenfeld, with their open-air habits, taking care that their favourite resort shall never become songless? Seated on a broad-leaved jessamine, the shrub which generally conceals the nest, the male bird will sing although you pass within four feet of him, eyeing you as if perfectly aware that he is a privileged character. Besides the nightingales, a great variety of other birds find shelter in this privileged place, and being never molested, afford the naturalist excellent opportunities of observing their habits. Amongst others, the hoopoes generally build here; the golden oriole suspends its curious nest from the highest branches of the aspen, and breathes out its cheerful flute-notes at evening; the Bohemian wax-wing is a regular and plentiful winter visitant; whilst a variety of finches and warblers of less note complete this real 'happy family.'

THE TWO ROSES.

Being with my friend in a garden, we gathered each of us a rose. He handled his tenderly; smelt it but seldom, and sparingly. I always kept mine to my nose, or squeezed it in my hand, whereby in a very short time it lost both its colour and sweetness; but his still remained as sweet and fragrant as if it had been growing upon its own root. These roses, said I, are the true emblems of the best and sweetest creature enjoyments in the world, which, being moderately and cautiously used and enjoyed, may for a long time yield sweetness to the possessor of them; but if once the affections seize too greedily upon them, and squeeze them too hard, they quickly wither in our hands, and we lose the comfort of them; and that either through the soul surfeiting upon them, or their just removal, because of the excess of our affections to them. It is a point of excellent wisdom to keep the golden bridle of moderation upon all the affections we exercise on earthly things.—*Flavel*.

UNION.

Science, the partisan of no country, but the beneficent patroness of all, has liberally opened a temple where all may meet. Her influence on the mind, like that of the sun on the chilled earth, has long been preparing it for higher cultivation and further improvement. The philosopher of one country sees not an enemy in the philosopher of another: he takes his seat in the temple of science, and asks not who sits beside him.

BARGAIN-HUNTERS.

THERE is a large class of persons who are so inveterately prone to bargain-hunting, that they seldom or never purchase anything of an abateable nature which they do not cheapen as much as possible. This habit is not so much attributable to any lack of means in the buyers, as to a childish love of obtaining a maximum quantity at a minimum value, which affords them the additional gratification of boasting afterwards of their bargains, and complimenting themselves on their own shrewdness. With such persons the purchase of sixpennyworth of oranges is as eagerly seized to gratify their favourite propensity as the order for a set of plate; and we have known instances of individuals, possessed of ample pecuniary resources, so confirmed in this habit, as to wander in anxious uncertainty from stall to stall before they could decide the momentous question as to which was the most eligible pennyworth of apples.

This habit of bargain-hunting, while we laugh at it for its folly, deserves to be denounced for its mischief. It holds out a premium to unfair trading, to trickery and lying: it is a cruel oppression of him who buys upon him who sells, and powerfully assists in lowering the hard-earned wages of the poor mechanic. The manufacturer is compelled, in order to gratify the morbid love of cheapness, to produce goods of the most trashy and useless description, and to reduce the wages of those whom he employs to the lowest fraction. The shopkeeper, in order to secure this description of customers, is forced to adulterate his articles; to profess them to be what he knows they are not; to exert himself, by short weight, lying puffs, inferior substitutions, and a thousand unworthy artifices, to keep on a fair equality with his neighbours. No sooner does a new shop open, the owner of which professes to sell cheaper than usual, than he is patronised by the bargain-hunters, to the great injury and often ruin of his more conscientious competitors. Whether he himself ever intend to pay for his stock is not inquired into; whether he intend to pursue an honest and honourable course is held to be no business of the customers: he sells cheapest, and this supersedes every other consideration. The consequence too often is, that the bargain-offering tradesman, after having injured many a respectable shopkeeper around him, suddenly decamps at the expiration of a few months, and the secret of his bargains is at length apparent; namely, that never having intended to pay for the goods himself, any receipt must be a clear gain to him, and he could thus afford to sell at prices which must be ruinous to the upright dealer.

This cheapening mania exercises also a most pernicious influence in producing distrust, duplicity, and unmanly feeling between seller and buyer. The seller, sharpened by past experience, is in self-defence com-

pelled, in order to obtain a remunerating profit, to ask more than the real value of the article, in order to leave room for the abatement which he expects as a matter of course to follow. The offer by the buyer of less than is asked is really an insult, for it virtually implies that the seller is either a fool or a rogue—a fool to take so little, or a rogue to ask so much; and thus the straightforward honesty and integrity which should characterise dealings in the market or the shop, as much as anywhere else, is set aside, and seller and buyer meet together with a feeling that confidence and honour are out of place there, and that cunning and overreaching are among the recognised moralities of trade. The seller, while he introduces the article to his customer, feels a conviction that unless he adds an untruth to the specification of the price, unless an assertion is made or a warranty given which it would be absurd to believe, the article will be rejected, and the hesitating customer will not purchase it, but patronise some other less scrupulous tradesman. The bargain-hunter, on his side, turns the article over in a contemptuous manner, exerts his ingenuity to find some fault in it which shall afford a pretext for a lower offer, and having found a real or an imaginary one, bids something below what he often must know is its real value. The poor tradesman wants ready money, the article really cost him more, he knows of other shops where it may be had at that price, and, with a sickening heart and an inward condemnation of the selfishness of man, he accepts the offer, and the purchaser departs with his bargain. But, strange metamorphosis, the article so recently pronounced almost worthless, the purchaser now boasts of as excellent, worth double the money, and delights to hear his friends innocently express their surprise how it could possibly have been made for the price. Such a mode of dealing is unmanly, ungenerous, and unjust, and requires but to be candidly considered to be denounced by all who think and feel rightly.

The influence of this pernicious system upon the labouring part of the community is cruel and disastrous. Some time ago, the public were presented with accounts of the misery prevalent among a large class of women in the metropolis, whose occupation consisted in the making of shirts at the insignificant sum of three halfpence each. Indignation, as it appears to us, was on this occasion levelled at the wrong parties. The blame, we are persuaded, lay less with the immediate than the remote employers. The public, which vented its anger on the shopkeeper, was the real transgressor; for the dealer merely obeyed the popular demand. Pressed upon by the insane cry for low-priced articles, as well as by a general competition, the manufacturer and shopkeeper, if they would do business at all, must reduce their expenses to the lowest point in order to obtain any profit, and to this end are compelled to wring from

their workpeople the utmost amount of work for the least possible remuneration. Unreasonably protracted hours are resorted to, toll is not allowed to cease with the day, the labour of the woman is introduced to supersede that of the man, and that of the child to supersede both, education is necessarily neglected, deformity produced, stimulants resorted to, vicious habits formed, and squalor and disease are induced; and all this too often that the purchaser may procure an article at a fractional abatement. The occasional subscription and the cold donation of charity are but a poor reparation for depriving the workman of his honest earnings, and the manly independence of pocket and of character which it is so desirable he should possess. It is true that the payment of fair prices by the buyer will not always secure fair remuneration to the operative, but the habit of cheapening must have a tendency to lower wages and inflict misery on the producers.

The pernicious practice of bargain-hunting is, we fear, by no means confined to the rougher sex. It is to be lamented that the practice is far too common among that sex whose kindness of heart and sensibility need no eulogy, and whose propensity in this respect we can attribute to no other source than thoughtlessness. It is perhaps also partly to be accounted for by the fact, that females generally have less money at command than men, and therefore when they spend it are perhaps somewhat more unreasonable in their exchanging expectations. A little thought as to the amount of misery to others which must result from the gratification of this propensity, would surely be sufficient to convince them of its unreasonableness and inhumanity. Little do ladies think, while they are cheapening the thread and the tape, or the shawls or the linsens they purchase, how much poverty and misery they are assisting to entail on the sickly operative who makes them, and how much of the ignorance and destitution and vice, the bare mention of which shocks their sensibilities, is traceable to this baneful practice.

The habit we have denounced is also very fallacious in a pecuniary point of view. The most shrewd and practised cheapener is often deceived, and finds, after he has secured the bargain, that, to use the common phrase, 'it is too cheap to be good,' or that he did not really want it, and therefore it was dear at any price. He discovers too late that what he has bought was made to be looked at rather than used, to deceive rather than satisfy, and that the little he gave for it was far too much for such an article, as it was really worth nothing. The cheapest things may be very dear, and the dearest very cheap, and good articles cannot reasonably be expected at any other than fair prices. Independently therefore of the injury which the habit of cheapening inflicts upon the workman, it is deceptive and unprofitable even to the purchaser. The prices of shopkeepers are certainly not always to be paid without demur, for this would be to hold out a premium to imposition and extortion, but there should be consideration on the part of the purchaser as to what ought to be the fair price of such an article. To deal as much as possible with tradesmen who are known for their integrity and uprightness, without being seduced by every unprincipled adventurer who professes to be 'selling off under prime cost,' and closing business at a 'tremendous sacrifice,' will be found in the long-run not only the truest economy, and the most satisfactory to the purchaser, but also the most advantageous to the wellbeing of society and the general interests of honesty and honour.

NOTICE OF TWO OLD PERIODICAL WORKS.

We have chanced to be lately introduced to two local predecessors of our own—that is, two Edinburgh periodicals of light literature—published upwards of a century ago; and which, to the best of our knowledge, are entirely unknown to the present generation. One is entitled *The Réveur*,* and was commenced on Friday the 18th November 1737; the last number possessed by us—which, however, does not seem to be the last published—is dated May 19, 1738. The other paper takes the name of *Letters of the Critical Club*. To evade the duty of a halfpenny then exacted from weekly papers, it was published monthly, the various articles nevertheless being dated on particular days. We possess only the numbers of the first half of the year 1738. The *Réveur* is a large quarto, each number comprising two leaves: it is stamped, and the price was 2s. 6d. per quarter. It appears to have been 'printed for A. Kincaid, and sold at his shop opposite to the Parliament Close, where subscriptions and advertisements are taken in.' The *Letters of the Critical Club* appear in a duodecimo form, at sixpence per monthly number: they are 'sold by A. Martin, and other booksellers in town.' At the end of our copy of the former work, there is an odd number of another Edinburgh periodical of the same character, entitled *The Conjuror*, and dated January 16, 1736. The *Critical Club* also speak of 'several attempts made in this place of publishing papers of this kind,' adding, 'and frequently with very indifferent success.' It thus appears that the spirit for such literary undertakings was much more active in our northern capital, about the time of the Porteous Riot, than might have been supposed. It is amusing, however, to mark the small scale on which these publications proceeded. The *Réveur* states in his thirteenth number, that the demand for his paper is so great, that his bookseller 'thinks of getting another servant.' In the case of the present journal, an analogous boast would, we suppose, relate to a few more horse-power for the engine driving the printing-machines.

At the date of the *Réveur* and *Critical Letters*, elegant literature had hardly an existence in Scotland. The Blairs, Robertsons, Humes, and Smiths, who first successfully competed with English authors, were youths barely emerged from college. Allan Ramsay is almost the only literary name of the period now remembered, and his department was that of familiar Scottish verse. We must therefore expect that any literary essays produced in Edinburgh at such a time would only show tendencies or aspirations towards those qualities which command respectful attention. The effort is certainly made in both of the papers under our notice, but with a very moderate degree of success. And in one respect, we have even to regret that such an exertion was made, for it has caused an almost total absence of such national and local allusions as would have now of themselves given the papers a value. The social features alluded to are English as much as Scotch, and there is not one vernacular expression used throughout the whole of either book. There is the appearance, however, of scholarship and reflection, especially in the *Réveur*; and in both, the cause of virtue and of rational manners is zealously maintained.† Several writers

* Fr.—The Dreamer.

† By a strange coincidence, a friend whom we met on the day on which the above article was written, mentioned that David Ritchie, of Manor, the original of the 'Black Dwarf,' had heard of the *Letters of the Critical Club* as an excellent book, there being no 'debasery' in it. The poor dwarf, who had a strong literary taste, though of a limited kind, actually interested his neighbours, Professor Adam Ferguson and Sir James Montgomery, to write to Edinburgh and London for a copy. They were not successful; but David ultimately, our friend thinks, obtained the book.

seem to have been at work; but all conjecture as to their names is now nearly in vain. Hamilton of Bangour might have been suggested as a probable contributor, if not editor, did not the politics of both lean to the Whig side. And this reminds us to mention that the Letters bear a courteous, but not fulsome dedication to President Forbes, a generous patron of literature in those days, as the author of the Seasons well knew.

The Critical Club is described in the first number as composed of Will Portly, Dick Crotchet, Lady Courtly, her daughter Miss Jeanie, and other fictitious characters; and it is, in fact, of their letters that the subsequent papers consist. One trait of Crotchet is Scottishly characteristic, that, by his habit of humming songs, 'he has offended many good people on Sundays.' Miss Jeanie Courtly is an admirer of romances: she reads Cassandra by the parlour fire. She 'is far from having anything of the prude in her character; yet she is a very modest girl; she will allow one kiss before company, but is highly offended if he [her lover] attempts to steal it in a corner.'

In the second letter, Will Portly remarks with surprise, what is still liable to similar remark, that mirthfulness should take such possession of the public at the close of the year, when all men are so apt to complain of the shortness of life, and the rapid transit of time. 'Among the vulgar,' says our essayist, 'there is scarce a man but thinks it an incumbent duty on him to be drunk at this occasion. In these days there is no work done, no business minded, and every one gives a full swing to joy. Ask any man why he was so joyful, for instance, last occasion of this kind, he will scarce be able to give a better answer than this, "that the old year has come to a close, and the new one is begun." As if he had grounds to rejoice because so much more time has passed over his head, and because he is nearer his grave by one whole year than he was at the last occasion of this kind.'

The subjects treated in the Critical Letters are by no means *recherchées*. First we have the treatise on time; next we have an essay combating the popular ideas about apparitions and omens; afterwards one on religious intolerance; and so on. In a letter respecting theatricals, the writer expresses his regret for the loss of the Edinburgh playhouse, and proceeds to defend the stage from its calumniators. His argument as to the expense it occasioned to its votaries is characteristic of those days of false political economy. The actors are such thoughtless people, that they spend as fast as they gain; and, says he, 'I reckon nothing an expense upon a place but what carries money out of it, which this does not.' 'I think,' he says in conclusion, 'I have reason to speak thus in favour of the theatre, since I have been frequently sensible of reaping considerable instruction from attending it. I remember, some time ago, I saw the tragedy of Cato performed here; everything before the scenes seemed to be very solemn and serious, and I was taken as much with it as if I had beheld the real persons of Cato and the other Romans concerned: but taking it into my head to step behind the scenes between acts, into the dressing-room, how different was their appearance from what it had been on the stage. There I heard Lucia and the virtuous Marcia scolding like oyster-wenchies; Juba, the Numidian prince, was exercising the office of barber to his general Syphax; Marcus and Portius were adjusting their full-bottomed periwigs at a glass, and making up a mixture of a Roman and a modern beau; Cato and Sempromius were very amicably drinking a mug of porter together; and Lucius was taking a chaw of tobacco. This difference in the behaviour of the actors behind and before the scenes, raised in my mind a very useful reflection, for I took this to be an emblem of the world, and of mankind in general, who appear in very different shapes, according as they act in public or in private.'

In a paper on friendship, the feeling is said to have a range of objects without limits. 'Though some may

affirm that it is confined to one's family, fellow-citizens, acquaintances, or countrymen, yet I am of opinion,' says the writer, 'that the passion extends in some degree to all mankind. For instance, place a Scotsman in England, where all are strangers to him, should he meet a Scotsman there whom he never saw in his own country, he will be fond of making up a friendship with him; place him next in Germany, if he meets an Englishman, he will feel the same desire; transport him next to China, if he meets there a German, or any European, he will reckon him his countryman; translate him next, if it were possible, to Saturn, or the moon, if he sees there a Chinese, or Persian, he will know his fellow-inhabitant of the same planet, and court his acquaintance.'

Miss Courtly has a waggish description of a fop lover in the tenth letter. 'In pops Tom, our footman. "Madam," says he, "here is Mr Crotchet, and another very sprightly gentleman, come to wait upon you." I desired him to show them in. Dick advances with his gentleman following. "Miss Jeanie," says he, "here is my good friend, Mr Starchie, come to pay his respects to you." Well, after this prologue, compliments and salutation were discussed, we took seats; but had you been there, Mr Pliant, to have observed Starchie's behaviour and dress, you would have got the picture of an accomplished beau and a complete fop. With his embroideries and lace, he was the likeliest of anything to a man of the pastry-cook's manufacture, bedaubed with gold foliage. And in all his motions and actions, he was so stiff and affected, as he seemed to be acted upon by springs, and resembled a puppet more than anything else. I should be unsufferably prolix to describe in a letter the airs, the oaths, the nonsense of the empty thing. He talked with a great deal of familiarity, as if he and I had been for ever intimate; of my cousins, Miss Fanny and Miss Charlotte, whom you know you used to visit. He told me he had once fallen so desperately in love with Miss Fanny, that he crossed the street on foot to visit her in a rainy morning; conducted her chair home with a flambeau; gave her seven serenades; stole her garter, and wore it half a year about his waist. How Miss Charlotte had played the coquette to him, after he had been at the pains to ogle her two nights running at the playhouse; but he had half a dozen of billet-doux from her, which he could show, if he had a mind to be revenged. I could scarce suffer the puppy's pertness, especially as I knew for a truth that neither of these ladies had ever spoke three words to him. The rest of the discourse was as childish, and now and then adorned with, O lard, medem! Strike me stupid! and other such elegant phrases. And then his gestures were as apish. Had you seen how he laughed at his own jests, to show his teeth; how foppish he appeared in his conversation, with his snuff-box and his cane; what methods he took to show the diamond on his little finger in taking a cup of tea; and what wry faces he made while contemplating his own dear features in the mirror above the chimney. I soon discovered, however, that Dick was playing the rogue with him; for he asked me several oddish questions, as, How I liked Mr Starchie's toupee? If he had not the most modish way of exercising the snuff-box and cane of any man in Britain? If I did not think there was an infinity of wit and humour in the choice and fashion of the fringe on his vest? To which I answering in the affirmative, the trifle at every reply made me an affected stiff bow, with, "Lard, medem, you do me too much honour. Strike me stupid, if I be not the happiest fellow upon earth, to please the ladies so, and without studying it too," &c. It strikes us as hardly conceivable that such a being as this existed in Scotland in 1798. Most probably he was one of those imaginary beings who live upon the stage and in literature, and are only supposed to have prototypes in human nature.

We have looked with care over both volumes for matters characteristic of the place and time; but our collections are extremely meagre. Here and there occurs a Scotticism, as when Shakspeare is spoken of as a man

of *scrip* education. There are many references to the excessive drinking of the age, and a set of sots are described under the name of Solitary Benders; that is, toppers. It is stated of one gentleman, that 'he expresses such a regard for his mistress, that he will get beastly drunk in tossing of her health; he will eat her glove as a delicious morsel; nay, he can eat hay, if it comes out of her fair hand.' The morals and good taste of gentlemen of that age are shown in a history which passes through several numbers of the Critical Letters, respecting a certain Jack Townly, who courts a beautiful young lady with a profligate design, and is only argued into matrimony by a respectable old gentleman writing from Dalkeith under the name of Scoticus. Gentlemen are represented as coming every day to the Cross to meet their friends. They spend much time in coffee-houses [the Laigh Coffee-house is cited]. They 'saunter round the meadow,' meaning Hope Park, near Edinburgh. There is also frequent allusion to the Assembly, a periodical dance which reigned at that time, and is often praised in the poems of Allan Ramsay. A young spendthrift is expected soon to secure a 'perpetual dwelling for himself in the city, either in the Abbey or the Prison, according as his fancy leads him; the abbey implying the sanctuary of Holyrood, sacred to hopeless debtors. It is surprising, however, how successful the editors have been in suppressing those special references which mark provincialism, the terror of the Scotch literati through the whole of the last century.

One of the most successful papers of the Critical Club is one silyly satirising the veneration paid to external appearances. It speaks of a new philosophy, by which the virtues and other characters of human beings are represented in material forms composed of silks, laces, clothes, linen, and other stuffs. 'For example, the philosophers of this sect tell you, that rusticity is represented by a gold or silver cord adorning a hat or a coat; wit by a broad lace and fringe; sagacity by a full-bottomed periwig; foresight by a snuff-box and a mirror in it; a plain homely taste by a Spanish Olla Podrida, or what we call hodge-podge; a polite refined taste by a French ragout; understanding by a gold-headed cane; servitude by a hat with a plain broad lace; courage by a silver-handled sword; religion by a broad-brimmed beaver; sagacity and wisdom by a scarlet cloak with large buttons; freethinking by a narrow-brimmed hat; profound humour by a pair of stockings with gold clocks; love by a gold ring; humility by a pair of high-heeled shoes; modesty by a hoop; moderation and strictness by a pair of stays straitlaced; devotion by a fan; and affability and good manners by a powdered toupee. Thus they have reduced all the moral virtues to certain substantial forms and appearances, which are more evident to the senses, and strike them in a stronger manner than when they were described in the old abstract speculative way; so that, by this new system, a man may be a judge of virtue or vice by only using his eyes; whereas the other method made it necessary for a philosopher to set his understanding, judgment, and all his reasoning faculties to work, before he could discover the nature or difference of virtue and vice. This is of singular advantage, since it points out to us the easiest way to become philosophers, and reduces the stature of the goddess philosophy to that of a little *embonpoint*; whereas before, they tell us, her head touched the stars. To know a man of virtue or merit, then, by this system, we have no more ado but to look at his outward man, without the least regard to what he has in him. For instance, should he be equipped *a-la-mode* with lace, fringe, embroidery, and brocade, well essenced and powdered, and have a genteel modish gait and air, he is company for the best; he may shine at courts or at the levees of the great; he may swear, drink, ramble, and play the fool without any questions being asked. These trifles will never diminish his character, and he will be a man of merit in spite of fate, and a pretty companion for the best man in the nation; yea, he will

be courted, cringed to, respected and adored, both in ordinary discourse and in dedications, as if he were a god; yielding crowds will fall back respectfully to make way for him at the sight of his embroidery; and vulgar wretches, who come to stare, will be cudgelled, kicked, and thrown down in heaps, to cut out a lane for his passage. Now, let us view the insipid fellow, whose character is held in as much disrespect as the other is esteemed. Should we see one with a pair of shoes and hobnails in them, a plain homely dress, and a clownish gait, shabby hair, or an old periwig, be sure he is company for nobody but scoundrels, and condemned to the obscurity of alehouses and garrets.' In this passage there are truths that ever have been, and ever will be, applicable.

The Révêur is more stiff and essay-like than the Letters, but often contains good sense, tolerably well expressed; as, for instance, in the following passage. 'Life is not to be measured by existence, but by action. Were we to apply this rule to the bulk of mankind, we should find their lives much shorter than we commonly compute them, and that many have not as yet begun to live at all. One half of our time is necessarily employed in sleeping, in eating and drinking, and in diversions and amusements, requisite for the support and for the better plight of our bodies; this is lawful and commendable. But to throw away our whole lives in the bare maintaining them, is, I may say, a sort of self-murder, or, as Seneca calls it, a breathing death, and a burying a man alive. If a man would live in a manly and becoming manner, let him exert those rational faculties which are the dignity of his nature, and which put him above the level of the beasts that perish. Let him improve every minute, and make the most of the small space which Heaven has allotted him, by rendering himself as serviceable to his fellow-creatures, and as wise and virtuous for the increase of his own happiness, as possible. He needs never sit idle for want of something to do; if the ordinary business of life be not sufficient, the search after knowledge and truth will do more than fill up all the vacancies; and if the love of fame and of happiness cannot fire his breast, the love of mankind and of his country should influence him.'

Being stamped, the Révêur fills up its odd columns with news. We have great accounts of the wars between Turkey and Austria, and of the efforts of the Corsicans under King Theodore to maintain their independence against the Genoese. There is also a strong anxiety expressed to get the ministry brought up to a declaration of war against Spain for her aggressions upon British commerce. The excellent Queen Caroline becomes dangerously ill in consequence of a cold caught by sitting in her new library; and instantly the London tailors buy up all the black cloth. She dies, and is greatly and deservedly mourned. Soon after, we hear of the Princess of Wales being in the condition which enabled her, in June 1738, to give to the world the infant who in time became George III. At that time, as is well known, the Prince of Wales, the weak but well-meaning Frederick, kept up a party in opposition to his father, and was upon the worst terms with the king. He used to have rival levees at his house in St James's Square. The present generation will learn with surprise that the following notice, signed by the lord chamberlain, and dated February 27, 1738, appeared in the London Gazette:—'His majesty having been informed that due regard has not been paid to his order of the 11th of September 1737, has thought fit to declare that no persons whatsoever, who shall go to pay their court to their royal highnesses the Prince or Princess of Wales, shall be admitted into his majesty's presence at any of his royal palaces.' We are informed that on the Wednesday after the appearance of this notice, there was a more splendid appearance at the prince's levee than usual. Good taste, not to speak of good feeling, has certainly been improved at court since those days.

We now take leave of these two curious specimens of

the literature of a former age, hopeful that we have not very much tired the reader with what has been so interesting a treat to ourselves.

AN HOUR IN NEWGATE.

THE stranger in London who may be on his way to the huge nucleus of sight-seeing, St Paul's cathedral, sometimes stops midway in his ascent of Ludgate Hill to glance down a street on the left, called the Old Bailey. He perceives that much of one side of the street is occupied by a mass of heavy blackened building; and he defers his visit to the most celebrated of churches, to take a nearer view of the most notorious of prisons—Newgate.

Passing, in his transit along the Old Bailey, two edifices, the first formerly called the New, and the further one the Old Bailey (but now the central criminal courts), he arrives before Newgate. The daily deposits of London smoke upon its walls for nearly a century, have given to the exterior a dingy aspect, quite accordant with the gloomy uses of its interior. It is a long structure, with nothing to relieve its dungeon-aspect but the governor's house standing in the middle, with glazed windows and a gaily-painted door, which offer a curious contrast to the two massive and heavily-studded entrances of the prison itself, and to the monotonous extent of blackened and windowless wall. In short, the dreary look of the outside of this celebrated prison helps to call up all those recollections of crime and misery with which its interior is associated.

The origin of Newgate dates from an ancient custom of imprisoning malefactors in the houses attached to the gates of cities. So long ago as 1218, the gate on the site of which the present prison partly stands was used as a place of confinement, and was called the Chamberlain's Gate. In 1412, it was rebuilt by the executors of the famous Sir Richard Whittington, out of the effects he had allotted for works of charity: his statue, with the traditional cat, remained in a niche to its final demolition. The gate was destroyed in the fire of 1666, and rebuilt, whence it obtained the name of Newgate. That, again, was intentionally demolished, to make way for the present prison, which was completed in 1780.

Should the stranger wish to have a sight of the interior of the gloomy edifice, he must provide himself with an order from one of the sheriffs of London. Such an order was, some time ago, politely handed to us by one of those officials. On arriving at the proper entrance, we mounted the steps, and knocked at a high wicket, heavily spiked at the top; and on showing the signature of the sheriff, were promptly admitted into a moderately-sized hall. The porter was far from the sort of person in outward appearance which one usually pictures as a jailer. Good humour and kindness beamed from his face, and a little circumstance which presently occurred showed that his countenance was no untrue index of his real character. It happened that a young and respectable-looking woman was seated on a bench in the hall, weeping. The moment the turnkey had asked us to wait till the proper officer came in to show us the prison, he retired to the mourner, and said something consolatory. From what we could understand, her husband had that day been committed to Newgate from one of the police-offices on some minor charge.

As the appointed cicerone was some minutes in forthcoming, we entered into conversation with the porter, who is evidently an intelligent person. It was a matter of some curiosity to us to know what the general feeling of the prison officers was regarding the moral effects of public executions, by far the greatest number of which take place within sight of where we then stood, and under their eyes. His answer to the question was, that as far as his own experience and observation went, the attracting of crowds to the place of execution had a decidedly immoral tendency upon those who attended them; and that the crowd invariably showed, from the

levity of their conduct, that they assembled to seek—not a warning against crime—but amusement for the passing hour. In this opinion he believed that most of his colleagues joined, however much they may be divided in opinion as to the expediency of abolishing capital punishment altogether. No one doubted the ill effects of the present mode of its infliction. While we were conversing, the governor of Newgate entered the hall, and going up to the young woman on the bench, desired her in the kindest tones to follow him into a small ante-room, and he would speak with her. The considerate attentions shown by the Newgate authorities from one of its lowest to its highest officer, produced impressions quite at variance with the harsh and stern ideas with which prison-keepers are usually associated.

At length the person arrived who was to show us over the jail, and under his guidance we passed through several dark passages, till we emerged into a light one. The right side of the corridor is formed by a double iron grating, beyond which is one of several small yards, in which prisoners were allowed to take exercise. At the grating, such friends as are occasionally allowed to visit them, take their stand and converse, but only in the presence of an officer; each word having, moreover, to pass between the double row of iron parallels.

By the door at the end of this gallery we entered that part of the prison set aside for females, and were received by the matron. In the first apartment, there were about half-a-dozen females sitting round a table. One was mending an apron, another was reading, but the rest were idle. They rose at our approach, and all bore such an appearance of contrition and meekness, that on leaving the ward, we asked the matron what they could have done to merit imprisonment. 'Sir,' replied the lady, 'it is the rule here to classify our inmates not so much according to the enormity of the offences they are accused of, as according to their habits and reputation. Known bad characters, who have been committed here for the third, fourth, fifth, or sixth time, are never placed with the less hardened.'

We ventured to presume that the women we had just seen had but newly entered the paths of crime. 'On the contrary,' replied the matron, 'they are the worst characters in the jail! The oldest of them, who was the first to rise with such a show of respect, has been within these walls at least twenty times before.' This was startling and melancholy intelligence. The excellent matron said, with a sorrowful countenance, that she found it to be a general rule, that the more hardened the criminal, the deeper the hypocrisy.

The chief female wards are nearly all alike, and a description of that we had just left applies with but little modification to the whole. It is a long room, lighted on one side by high semicircular windows, or 'fan-lights.' Against the opposite wall are two rows of sleeping places, one under the other, and bearing some resemblance to the cabin berths of a ship. Each was provided with two rugs and a pillow. The only furniture in the room was a long deal table and a couple of forms; a comfortable fire burned in a grate at the end. On the table were some Bibles and prayer-books.

In an upper ward into which we were shown, some half-dozen accused females were confined, whose persons were less known to the officials, and consequently whose characters were deemed somewhat better than those of the prisoners below. In demeanour and appearance, they differed but little from the other prisoners. From their ward we were ushered into another set apart for a class of prisoners which must be, from their being allotted an especial apartment, from time to time numerous—namely, servants guilty of dishonesty to their employers. In most cases theirs are 'first offences'; hence they are never mixed with females who are included in what the officers call 'the promiscuous felonies.' At the time of our visit, there were thirty-eight females 'in' on suspicion of having committed various crimes and misdemeanours.

Having finished our survey of that part of Newgate

set apart for the softer sex, we retraced our steps, and entered a spacious hall cheerfully lighted, in the centre of which is a glazed enclosure. This, we were informed, was constructed for the convenience of such prisoners as wish to consult their attorneys. Closed in there, they may confer with privacy, and at the same time within sight of an attendant. The cheerful look of this hall confirmed an impression which took its rise from the general appearance of the apartments we had as yet seen. Except the iron bars before mentioned, we had seen nothing nearly so gloomy, inside Newgate, as its blackened and forbidding exterior. The wards were as unlike dungeons as the public rooms of an inn. All those ideas of severity and punishment with which a stranger enters a jail were dispelled; and so far from a penal look, an air of comfort pervaded the place. The general expression which sat on the faces of the females whom we had seen was that—not of misery, dread, or remorse—but of contentment. Many of them—especially those described as the most wicked—had all the appearance of persons who were at present placed in better circumstances than they were accustomed to. This indeed must have been true of many of them. For a scanty and precarious subsistence, they were now exchanging a sufficiency of food, comfortable lodging, and, if they need it, warm clothing. Besides this, they were allowed to be just as idle as they pleased; for any work they did was for themselves, and quite voluntary. Thus, what we had as yet seen completely overturned our previous notions of the prison, and tended to banish those terrible associations which rise in the mind on hearing or seeing the word 'Newgate,' the very dread of which one had been led to think had deterred many an unhappy person from crime. What, however, we had inspected, seemed rather tempting than deterring to the poor and wretched; to many of whom Newgate must be an enviable rather than a dreadful retreat.

To account for this apparent anomaly, it must be explained, that in fact Newgate is no longer a place of punishment. It is what has been called, since the new modelling of the English criminal courts, 'a prison of transit;' in other words, a jail set apart for the safe custody of untried prisoners, whose guilt remains to be proved; of persons, in fact, who, having been examined before the magistrates, have had circumstances of suspicion brought against them sufficiently strong to warrant their being 'committed to Newgate for trial,' either at once, or in default of bail. It would therefore be a manifest injustice to render a residence in Newgate under such circumstances so irksome as to amount to a punishment, over and above the mere confinement, which is a punishment in itself. That indeed would be unduly punishing the innocent; for, by a maxim of law, every one is considered innocent until guilt be proved. Still, when the demoralising effects of complete idleness are taken into account, it surely is desirable that there should be some routine of light employment for the unhappy inmates, were it merely from tenderness towards themselves. However, whether the change from liberty and a scanty subsistence, to Newgate and good food and lodging with nothing to do, offer a premium to crime or not, the inmates cannot enjoy the change long; the periods of trial, otherwise 'the sessions,' occur so often, that the average stay of untried prisoners is only three weeks.

Another class of prisoners *in transitu* consists of persons who have been tried and sentenced, but whom it is not convenient to remove immediately to their penal destination—such as the penitentiaries, the hulks, or the place of execution. No distinction in treatment appears to be made between them and their untried fellow-prisoners, from whom, however, they are separated. Their stay is also short.

Such were the reflections we made and the information we received in the large hall. We were now conducted to the prison chapel, which presents a very curious aspect. Ascending some dozen stairs, the stranger finds himself in what he at first imagines is a

square apartment, without pews. On closer inspection, he decries that in fact the room is oblong, at least one third being cut off at each end by iron bars that reach from the floor to the ceiling; and within them a gallery or storey affords seats for two separate sets of prisoners—the tried and the untried. The opposite grille is covered with a thick screen, so that the occupants of that compartment—the female prisoners—may not see the males, nor be seen by them. In one corner of the square space on which we stood rises the pulpit and reading-desk, and against the opposite side wall are three parallel forms. At each end of these forms stands a common mahogany chair, with a hair-stuffed seat, and the word 'Newgate' carved on the back. In these chairs sit the wretched culprits who are to forfeit their lives, and to whom the chaplain preaches the 'condemned sermon.' The fact, that only two seats should be provided for such melancholy occasions, shows how greatly the criminal code has been modified of late years. The attendant who showed us the chapel pointed out a large quadrangular mark in the floor where we stood. 'That,' he observed, 'is the place where the condemned pew formerly stood. I have,' he continued, 'not more than five-and-thirty years ago, seen as many as sixty persons in that pew at one time, who were condemned to, and most of whom afterwards suffered, death!' With these words our conductor descended the stairs, and we followed him, occupied with no very agreeable reflections on what we had just heard.

Our inspection of the part of Newgate used for males presented nothing which we had not seen in the female wards. Each opened upon an exercise yard, in which we noticed some prisoners walking up and down; others within doors were reading or writing letters to their friends. In one ward we noticed a few respectfully-dressed men, who appeared more anxious and depressed than the others; another was solely allotted to persons suspected of making and issuing base coin—a crime which appears to be more successfully practised amidst the rapid exchanges of money in London than in any other commercial city at home or abroad. Our next visit was to the apartments used for juvenile offenders. About a dozen of these were waiting to be tried; a few receiving instruction from the Newgate schoolmaster. Their ages averaged from ten to about fourteen, and more open intelligent countenances than some of them wore, it is not possible to behold. We heard them read a part of their lessons, which they did fluently. The rest, we were told, could not read, and they looked more heavy and stupid than the others. They were nearly all pickpockets, the most adroit and best known to the officers being those who were the best educated. This sort of stealing requires the utmost tact and dexterity; consequently, the cleverest of the boys were the most skilful thieves. Two of them exhibited an address and manner worthy of young noblemen, and we were told that their older confederates occasionally dressed them well, so as to pass for genteel schoolboys. In this character they push into crowds, and commit the most successful depredations. The last apartment in this section of the jail which we were shown, was one of those recently substituted for condemned cells. It is provided with a bed, a table, good fire, and indeed with accommodation superior to that found in the other places.

Our guide now bade us follow him along a short passage, when, mounting a few steps, he unlocked a door, and we presently stood in a long yard surrounded on all sides by the prison buildings. It was the 'press-yard,' which makes so prominent a figure in the newspaper accounts of public executions. The sides of the enclosure are of immense height, and as you look up at the oblong bit of sky, the thought at once strikes you how impossible escape from such a place would be; yet our companion pointed out a corner up which an escape was a few years since effected. The stones composing the wall are very much 'rusticated' or roughened, and, by the aid of the small protuberances,

one William Sweet, a chimney-sweeper, climbed to the top of the perpendicular corner, got over the roofs of some adjoining houses into the street, and escaped. That part of the wall is now carefully made smooth with plaster—a striking exemplification of the adage about 'locking the stable door after the horse is stolen.' Such a precaution can hardly be necessary; for whoever sees the place, will at once be convinced that the sweep must have been a genius in climbing. Perhaps there are not ten other men in Great Britain who could perform the feat, and it is by no means likely that either of them will ever become an inmate of the press-yard.

The condemned cells were next shown to us. They are fifteen in number, and are entered by a door from the press-yard. That which we saw was a small narrow 'pen,' for it deserves no other name, scantily lighted by a high-barred window. In one corner a metal wash-basin is fixed to the wall, and there is an iron bed which all but filled the rest of the space. In each of these dismal cells as many as four capital convicts have been, before now, confined; all heavily ironed, and deprived of the use of their limbs, unless to drag their gyves along the press-yard at intervals, by way of exercise. This is now all altered, and the condemned cells are only used to punish such of the inmates of the other parts of the building as misbehave themselves. They form, in fact, a prison within a prison.

While we were inspecting these cells, a noise was heard as if some persons who had entered the press-yard were exchanging the ordinary salutations. One man exclaimed, 'How do you find yourself to-day, air?' To which a pleasing and somewhat cheerful voice replied, 'Pretty well, thank you. How are you?' This was so completely commonplace a circumstance, that it would have passed unnoticed, but from what our companion immediately told us. Alluding to the person who so cheerfully replied to the first salutation, he said, 'That is the man who was condemned to death last Friday. Next Monday he is to be executed.' The mere words of a being thus awfully situated naturally acquired a thrilling interest, the more so that they were so glibly and cheerfully spoken.

When we entered the yard, we saw the men leisurely parading it—the condemned and two prison attendants. The former was dressed in faded black, with an oil-skin cap partly covering his head. Both hands were in his coat-tail pockets, and he sauntered along the yard exactly as if he were taking a walk—leisurely, freely, and happily—across some field. That this man should possess the full consciousness that in three days he would cease to exist, seemed almost impossible, so calm and unconcerned did he outwardly appear. He was a slim, mild, and rather genteel-looking young man; the very reverse of what is generally conjured up as the figure of a murderer.*

From the press-yard, we were shown into the bath-rooms. Crime is, in a majority of cases, associated with filth, and before the new comers can be safely allowed to mix with other prisoners, they are thoroughly cleaned. To wash their clothing is often, from its tattered condition, impossible; and next to the bath-room is an oven in which the wretched habiliments—by being thoroughly baked—are purified of the animated filth with which they too often swarm. Should the clothes remain, after this process, in a condition to be worn, the wearers are allowed to resume them; if not, they are obliged to put up with the prison-dress, to which they naturally show great reluctance.

Near to these places is the kitchen; formerly the hall in which debtors (who were confined in Newgate) were received; a door opening from it into the street. This, therefore, is the 'debtors' door,' invariably mentioned in the newspaper accounts of executions, for from its

steps malefactors tread immediately upon the scaffold. The room itself is hidden from their sight; a couple of black curtains being suspended across it, from the door of entrance to that of exit, so as to form a short passage or alley.

The kitchen is completely fitted with coppers, boilers, and other utensils necessary to cooking food for so large an establishment. Here we may properly introduce the distary which is furnished to the transitory prisoners who are confined in Newgate. Every day each male is allowed eight ounces, and every female six ounces, of bread, with one pint of gruel for breakfast and for supper. We saw and tasted the bread; it was wholesome, quite free from adulteration (an excellence not to be relied on by honest purchasers of that article outside the prison), and answered to what bakers call 'seconds.' On Sunday, Tuesday, Thursday, and Saturday, the dinner consists of the above quantities of bread, with three ounces of meat weighed after it is dressed and without bone, with a quarter of a pound of potatoes. On other days, one pint of soup is substituted, the produce of three ounces of meat. That every prisoner may be fully aware of what he is entitled to, the dietary is legibly painted on a large black board, which is nailed up in every ward, and in case he thinks himself stinted, he may complain to the governor, to whom access is always easy. A reduction of the quantity of food is sometimes purposely resorted to as a punishment to such as may misbehave themselves during their stay in the prison, but in no other cases. Thus we perceive that the sustenance provided for the inmates of Newgate is infinitely better than that which most agricultural labourers in England, or any husbandman in Scotland, is able to obtain by the sweat of his brow.

From the kitchen we returned to the entrance-hall, and instead of egressing as we had entered, were conducted through an anteroom, in which were ranged on shelves a grim array of casts from the heads of celebrated malefactors. Passing through an office in which sits a clerk to take note of the commitments and other official matters connected with the prison, we were politely shown into the street by the governor's private door. We must confess that on reaching the open thoroughfare we breathed more freely; for, despite the improved unprison-like appearance of Newgate, it is a melancholy place to visit even for an hour.

SEEING THE COUNTRY BY STEAM.

'TO THE LOVERS OF THE ROMANTIC AND BEAUTIFUL.—One of the speediest, most delightful, and economical trips ever offered to the public, has been opened up by the running of Mr Percy's new fast coach, "Lightning," between C. and the railway station at S. The Lightning will leave the Turf Hotel every morning at six A.M., reaching the station in time for breakfast and the second morning train for B. From B. a steamer starts for L. half an hour after the arrival of the train, so that parties can be taken there, have an hour and a half for dinner, and then proceed by the six o'clock train for D., whence an evening train will convey them by the eastern line to C.; thus allowing them to pass over upwards of 200 miles of the finest country in one day.—N.B. Tickets clearing the whole route, without any extras for guards and drivers, may be had at the Lightning office.'

Captivated by this tempting notice, I rode into C., secured a ticket, put up at the Turf, and went to bed full of hope for the morrow. What a delightful thing it is to dream! None of your airy fantastic dreamings, where you are haunted with the dread of sinking through the filmy firmament into which you are exalted; none of your scenes of bustling human enjoyment, where the suspicion of insincerity is apt to intrude upon your happiest moments; but a dream of nature, where everything is bright and veritable—the waters calm and sunlit—the turf green and soft—the flowers sweetly scented—and the music—

Rap, tap, tap!

* There can be no indelicacy in stating that the criminal here alluded to was Hooker. He was executed on the Monday after we saw him—overpowered by fear and remorse.

Was ever dream so interrupted by the officious hand of a waiter? Come in.

Half-past five, sir—and here is hot water.

And what sort of weather?

Beautiful morning, sir—only the wind's a little in the east; but that will be nothing once the day's fairly up.

Rap, tap!

Well?

Boots, sir—allow me to fasten your straps, sir. This way, sir—cup of coffee in the parlour, sir.

Cream?

Yes, sir! Sorry—none till eight, sir; but here is some of last—

Coat, sir! That's the horn, sir—start in a minute, sir.

Why, it is not ten minutes since I got up yet.

Clock must be behind, sir—passengers all taken their seats—kept the box for you, sir. Back at ten, sir?—something hot, sir?—same bedroom, sir?

This side, sir—care of the wheel, sir—your umbrella, sir.

Thus had a quarter of an hour seen me knocked up, booted, coffee'd, coated, and seated on the Lightning; and away we rattled through the yet unawakened streets of C. Unless during the hasty minute that was grudgingly spent in picking up an additional passenger, I saw nothing of C. save rows of painted fronts, fastened window-boards, and gilded signs; and these reeled and danced and mingled in my eye like so many phantasmagoria, so rapidly were we wheeled along. For aught that I could discern, the gilded lamb might have been the brushmaker's boar, and the comb-manufacturer's elephant might have been safely substituted for the hatter's beaver. I do recollect, however, of a tall chimney-stalk, to the top of which two bricklayers were being hoisted—the impression being deepened by the driver's remark, that he 'shouldn't on no account like to travel in such a vehicle.' About as safe there as in the Lightning, if you go on at such a rate. 'Bless you, no, sir; this is nothing to what we do when once clear of the town.' And true it was; for, on rounding another corner, we were spinning along at the rate of twelve miles an hour, to be in time for the nine o'clock train at S., allowing half an hour for breakfast.

The route between C. and S. is described by the guide-book as one of the most picturesque in the island, 'presenting a succession of hill and valley, well-wooded estates, castellated mansions, and abounding withal in historical associations.' As to hill and valley, these I can answer for, for a more breakneck drive could not well be imagined; but as to its beauties, I had no sooner fixed my eye on a picturesque spot, than whizz went the Lightning, and a clump of wood or a shaggy knoll blotted it out from my vision. It was of no use to attempt the landscape, so I betook myself to the country seats; but here I was even worse; for before I could learn the name, the owner, and one third of the history of number one, numbers two and three stood displaying their fronts in the morning sun, and claiming their share of attention. Besides, the dread of an overturn kept my eye about as much on the road as on the country, so that all was confusion and jumble; no calm leisurely survey, that would enable a man of ordinary capacity to receive and arrange his ideas in proper order.

'What's the clock, sir?' interrupted our driver. Twenty minutes past eight. 'Three miles yet, and only ten minutes! Come, my chickies, this won't do; and away the cattle toiled and steamed as if another ten minutes were never to be granted us.

A little past the 'pointed time we were set down at S.; but before we were fairly seated in the breakfast-room of the 'Union,' it was found there was only a quarter of an hour left for what is usually the pleasantest of all meals. As is usual upon such occasions, nothing was to be had that was wanted, and everything that we did not care for was before us in profusion. Amidst orders, counter orders, the bustling of waiters, and the struggle of every one for himself, the signal bell rang,

and I had to declare myself breakfasted, though at the moment I could not for my life have told what I had ate or drank, or whether indeed I had taken anything at all. During the rush of greatcoats, carpet-bags, and umbrellas to the railway omnibus, I got a glimpse of the one street and church of S.; saw a considerable stir in the getting up of frontages; but beyond this, the little town and its trade might have as well been in the moon for anything that I could learn. In three minutes we were down at the station, and given over to the train.

Pleasant travelling by your railway train, to be sure, where one is shot along at the rate of twenty-five miles an hour, and where the fields, hedgerows, trees, and cattle, seem to the dizzy sight to be equally alive, and all equally intent on keeping up a merry dance to the music of the wheels. We had sixty or seventy miles before us; in other words, a three hours' trip; a pretty fair opportunity, thought I, for picking up a little knowledge of the surrounding country. I strained my eyes till their very nerves began to crack, for the purpose of observing the style of crop and culture on either side, but vain was the effort. Every field presented the same uniform green, which radiated, circled, and wheeled before the eye in misty indiscrimination. Nor was there any greater stability of form; for what was this minute square was next oblong or round; and before I could note the arrangement of the farmstead on the left, the mansion on the right was swimming away in the distance. In fact I felt as if placed on an island, with a current of country sweeping past me on both sides with extreme velocity. Baffled in my attempt to decipher the immediate, I betook myself to the remote, trusting, with the poet, that distance might lend 'enchantment to the view;' but in this quarter I was even more unfortunate, for the easterly breeze had brought a creeping fog, which robbed the heights in a 'more than azure hue,' and the level plain was far too flat to be interesting. Hedgerows, indistinct masses of trees, here a whitewashed front, and there such another, a cloud of smoke rising from the chimney of a coal-work, and vying in blackness with another sent forth by an iron-foundry, formed, so long as I had patience to look, the principal parts of the picture. Abandoning every idea of scenery, I threw myself back from the window, in the hope and with the intention of a conversation with one of my fellow-passengers. The first I attempted was a lady right opposite; but so convulsively did she grasp the hand-rail, and so broken were her replies, that it appeared absolute cruelty to force her to articulate. She had evidently read the last 'dreadful railway accident' in the newspapers, and sat expecting every minute to be the victim of a similar catastrophe. The next I turned to was evidently a cattle-dealer, a man of jolly dimensions, and to whom the habit of locomotion had rendered railway, steamboat, or stage-coach a matter of equal indifference. Eyeing my movement, he shrewdly intercepted me with a remark about the weather; and drawing his travelling cap over his ears, adjusted himself in a corner, evidently with the intention of sleeping out the rest of the journey. 'I always do so on a long stage; and it is the best thing one can do, especially if he has been over-hours the night before.' This was an extinguisher to my hopes of conversation in as far as he was concerned; and I could have no more ventured upon our only other companion, though in a public conveyance, than I would have obtruded into his counting-room. He was over head and ears among papers and calculations, evidently on some business speculation; and seemed, from the occasional glances which he stole at the surrounding country, to be grudging the time consumed in his conveyance. Three hours of travel were just to him three hours of business. He seemed, indeed, to be one of those souls who would consent to be shot from the mouth of a cannon, provided it would transport him more quickly to his destination; and had no more notion of the companionship of travel, than he would have thought of

entering into conversation with every one that walked with him the same street. Luckily, our destination was near at hand, and in less than half an hour we were safely set down in the suburbs of B.

Now, thought I to myself, I shall have a survey of this fine thriving port—its docks, streets, and warehouses. It is half an hour yet from the time of embarkation, and a man with ready eye can do a vast deal in outline even in thirty minutes, provided he meet with no interruption. Out, therefore, I sallied, noticing the structure and arrangement of the new station and docks; but just as I was making the next turn, a fellow shouting and waving his hat came coursing behind me. 'Going with the steamer, sir?' 'Yes, half an hour hence.' 'She's goin' in a few minutes, sir, a-once they take in their coals, as the tide is fast falling, owin' to the easterly wind; and if you don't want to lose your passage, you'd better be waitin' on.' Most unaccountable again; just as I was in a fair way of enjoying one portion at least of my trip, to be thwarted in this way—was ever mortal so unfortunate! It was of no use, however, to soliloquise. I had engaged for my trip; and if I did not choose to move forward, I must either remain where I was, or wheel back at double expense the unenjoyed route I had passed. Abandoning my ramble round B., I stalked sulkily on board the steamer, and in fifteen minutes was out on the open sea. Now, said I, in a vaunting tone, I shall at least have thirty miles of delightful coasting; and so seating myself in a quiet nook, and unsheathing a pocket telescope, I began to reconnoitre the beautiful villas and snug villages that stud that sea-board. Out, out, however, the steamer held, every stroke diminishing the distinctness of my prospect, till at last I might have as well looked through a bit of horn as through the lenses of my telescope. 'What's all this for, captain, if you please?' 'Why, sir, the coast is shoal here, and the falling tide and easterly wind compel us to hold out as well as we can. It's our safest course, though not the best for your prospect.' Done again! and so I rushed below in despair, and in ten minutes' time got gloriously sea-sick. Ugh! groaned I, and these are the pleasures of travelling. When we steered up to the pier of L., it was fully three-quarters of an hour beyond the usual time, thus leaving those who had a stomach to dine the brief space of forty minutes for that important ceremony. As for me, dinner was out of the question; so swallowing a glass of brandy and water, I threw myself on the sofa, sick, dispirited, and discontented. The sofa, like everything else, seemed to be leagued against me, for it heaved, and rocked, and swung most tremendously; and so I sallied out to the open air to await the starting of the train by the eastern route for the little seaport I had left in the morning.

Misfortune by this time had overcome my philosophy, as well as—I am sorry to own it—my good nature; so planting myself in a first class, I drew my cloak around me, pulled down my 'templar' over ears and eyes, and drew a magic circle of sleep between me and the world of my fellow-travellers. I heard no one, saw no one, and cared not whether the train passed through barren moors or paradises of fertility. All that I wished and prayed for was to be speedily set down at the spot whence I had started. In due time we drew up at the southern suburb of C.; and now shame and confusion took hold of me. How was I to reply to the hundred queries that were sure to be made as to the way in which I had enjoyed my trip? how did the country look? what thought I of S., of B., or of L.? All these pierced me like so many daggers, till a mischievous thought shot across my brain. I shall take note of C. by gaslight, describe the magnificence of its streets, the elegance of its shops, its blaze, its beauty, and so forth, in such language that my friends at the Turf will not be able to discover their own city in the description. I shall check-mate them for once, thought I; and as I was gloating over this idea, an obsequious tap was made on my shoulder. 'Mr Brown, I suppose?' The same, if you

please. 'I have been sent, sir, from the Turf with this cab, to bring you quickly up, as Mr Jones is waiting you on business. Will you step in, sir?' I instinctively obeyed the request; slam went the door; and away went the cab like fury over rough and rattling causeway. When I recovered myself, I reflected on my gaslight survey of C., and shouted to the fellow to drive slowly; but he mistook the injunction, and only plied the whip with double effect. In ten minutes I was fairly set down at the Turf, having since morning accomplished a distance exceeding 200 miles, and, as the phrase goes, 'seen the country.' After supping with my friend Jones—whose queries I parried like a fencer—I hurried to bed, and passed the night, as I had the day, amid the bustle of coaches, railway trains, and steamers, which danced, and wheeled, and circled in my brain, till the kind hand of 'boots' knocked me up to consciousness and breakfast the following morning.

Such to me at least were the delights of modern travelling—the beauties of a 'pleasure trip' taken in glowing June for the avowed purpose of seeing the country. Reader, if by your travels you wish to see and learn, and inwardly to digest, go by some decent Christian conveyance, be it even a carrier's van; but avoid as you would an enemy railway trains, steamboats, and stage-coaches that 'beat the mail.' Such whisking and shooting through space is too much for ordinary capacities; it allows no time for the mind to receive, handle, and store ideas in a proper and methodical manner. The senses must either take impressions by halves, and toss them to the memory as they come, or despairingly give up the task of receiving them at all. We who have been accustomed from our youth to a constitutional six or eight miles an hour, have no conception of thirty: our mental operations are not habituated to such haste; it is absolute cruelty to compel us to live in such a hurry. With the next generation, born and trained amid steam and bustle, it may be all very well; their perceptions will partake of the attributes that surround them, and the record of their memory may be kept in stenography, instead of, as with us, in a plain Roman hand. Train the young, say we, to as much speed as you please; but, for humanity's sake, let us who belong to a declining state of things accomplish our final stage at the pace to which we have been so long accustomed.

DISCIPLINE OF THE EYES.

THOUGH vision be one of the most important and the most comprehensive of the senses, it is one that cannot be exercised in its full efficiency without considerable practice and self-tuition. This fact, well-known in theory, was first elucidated by experiment in the case of the boy who was cured of blindness at the age of fourteen by the celebrated Cheselden. A case of equal interest occurred lately in London, a report of which by Dr Franz is given in the *Philosophical Transactions*. The leading results in both cases exactly coincide.

If a person totally blind from birth were, at a mature age, and in possession of all his other faculties, at once to obtain the full use of his eyes, one would be apt to imagine that he would perceive objects around him just as other grown-up persons usually do. This, however, is by no means the case. There is none of the senses so deceptive, taken by itself, as that of vision. No just idea can be formed of any object by the eye alone; and it is only by the aid and experience of the other senses, as well as by repeated practice in vision, that an accurate notion of even the simplest object can be obtained. To the inexperienced eye all objects are flat, or seen only as surfaces. All objects too, however near or distant, appear as if in one plane; so that form, size, distance, are all indistinguishable. Even colour depends upon proximity to the eye, for the brightest objects at a remote distance appear dim, and almost colourless.

The case operated upon by Dr Franz was that of a young gentleman of seventeen years of age, the son of a

physician. He had been blind from birth. His right eye was quite insensible to light, and in that state called *amaurotic*. His left eye contained an opaque lens, or cataract; with it he could distinguish a strong light, and even vivid colours, but he had no idea of the forms of objects. It was on this left eye that the operation was performed, and fortunately it proved successful. As the young man possessed an intelligent mind, and had been carefully educated as far as his condition would allow, the opportunity was a favourable one to test the accuracy of former experiments.

'On opening the eye,' says Dr Franz, 'for the first time on the third day after the operation, I asked the patient what he could see. He answered that he saw an extensive field of light, in which everything appeared dull, confused, and in motion. He could not distinguish objects, and the pain produced by the light forced him to close the eye immediately.' Two days afterwards the eye was again exposed. 'He now described what he saw as a number of opaque watery spheres, which moved with the movements of the eye; but when the eye was at rest, remained stationary, and then partially covered each other. Two days after this the eye was again opened: the same phenomena were again observed, but the spheres were less opaque, and somewhat transparent—their movements more steady, and they appeared to cover each other more than before. He was now for the first time capable, as he said, to look through the spheres, and to perceive a difference, but merely a difference, in the surrounding objects. When he directed his eye steadily towards an object, the visual impression was painful and imperfect, and the intolerance of light obliged him to desist. The appearance of spheres diminished daily; they became smaller, clearer, and more pellucid, and after two weeks disappeared. Dark brown spots (*musca volitantes*) floated before the eye every time it was opened; and when shut, especially towards evening, dark blue, violet, and red colours appeared in an upward and outward direction.'

As soon as the state of the patient permitted, the following experiments on his sense of vision were instituted. They were performed in succession, and on different days, so as not to fatigue the eye too much. In the first experiment, silk ribbons of different colours, fastened on a black ground, were employed to show, first the primitive, and then the complementary colours. The patient recognised the different colours, with the exception of yellow and green, which he frequently confounded, but could distinguish when both were exhibited at the same time. Gray pleased him best, because this colour, he said, produced an agreeable and grateful sensation. The effect of red, orange, and yellow was painful, but not disagreeable; that of violet and brown not painful, but very disagreeable; the latter he called ugly. Black produced subjectioned colours, and white occasioned the recurrence of *musca volitantes* in a most vehement degree.

In the second experiment, the patient sat with his back to the light, and kept his eye closed. A sheet of paper, on which two strong black lines had been drawn—the one horizontal, the other vertical—was placed before him at the distance of about three feet. He was now allowed to open the eye, and, after attentive examination, he called the lines by their right denominations. When he was asked to point out with his finger the horizontal line, he moved his hand slowly, as if feeling, and pointed to the vertical line; but after a short time, observing his error, he corrected himself. The outline in black, of a square six inches in diameter, within which a circle had been drawn, and within the latter a triangle, was, after careful examination, recognised and correctly described by him. When he was asked to point out either of the figures, he never moved his hand directly and decidedly, but always as if feeling, and with the greatest caution: he pointed them out, however, correctly. A line consisting of angles, or a sig-zag and a spiral line, both drawn on a sheet of

paper, he observed to be different, but could not describe them otherwise than by imitating their forms with his finger in the air. He said he had no idea of these figures.

In a third experiment, light being admitted into the room at one window only, to which the patient's back was turned, a solid cube and a sphere, each four inches in diameter, were placed before and on a level with the eye at the distance of three feet. Allowing him to move the head in a lateral direction no more than was necessary to compensate the point of view of the right eye, which was visionless, he was now desired to open his eye, and say what the objects were. After attentively examining them, he said he saw a quadrangular and a circular figure, and after some consideration he pronounced the one a square and the other a disc. His eye being again closed, the cube was taken away, and a flat disc of equal size placed next to the sphere. On opening his eye, he observed no difference in these objects, but regarded them both as discs. The solid cube was now placed in a somewhat oblique position before the eye, and close beside it a figure cut out of paste-board, representing a plain outline prospect of the cube when in this position: both objects he took to be something like flat quadrates. A pyramid placed before him with one of its sides towards his eye, he saw as a plain triangle. This object was now turned a little, so as to present two of its sides to view, but rather more of one side than of another. After considering it for a long time, he said that this was a very extraordinary figure; it was neither a triangle, nor a quadrangle, nor a circle. He had no idea of it, and could not describe it. When subsequently the three solid bodies, the sphere, the cube, and the triangle were placed in his hands, he was much surprised that he had not recognised them as such by sight, as he was well acquainted with these solid mathematical figures by touch.

There was another peculiarity in his impressions: when he first began to look at objects, they all appeared to him so near, that he was sometimes afraid of coming in contact with them, though many were in reality at a great distance. He saw everything much larger than he had supposed, from the idea obtained by his sense of touch. All moving, and especially living objects, such as men and horses, appeared to him very large. If he wished to form an estimate of the distance of objects from his own person, or of two objects from each other, without moving from his place, he examined the objects from different points of view, by turning his head to the right and to the left. Of perspective in pictures, he had of course no idea. He could distinguish the individual objects in a painting, but could not understand the meaning of the whole picture. It appeared to him unnatural, for instance, that the figure of a man represented in the front of the picture should be larger than a house or a mountain in the background. Every surface appeared to him perfectly flat. Thus, though he knew very well by his touch that the nose was prominent, and the eyes sunk deeper in the head, he saw the human face only as a plane. Though he possessed an excellent memory, this faculty was at first quite deficient as regarded vision: he was not able, for example, to recognise visitors unless he heard them speak, till he had seen them very frequently. Even when he had seen an object repeatedly, he could form no idea of its visible qualities in his imagination, without having the real objects before him. Formerly, when he had dreamt of persons—of his parents, for instance—he felt them, and heard their voices, but never saw them; but now, after having seen them frequently, he saw them also in his dreams.

The human face pleased him more than any other object presented to his view. The eyes he thought most beautiful, especially when in motion; the nose disagreeable, on account of its form and great prominence; the movement of the lower jaw in eating he considered very ugly. Although the newly-acquired sense afforded him many pleasures, the great number

of strange and extraordinary sights was often disagreeable and wearisome to him. He said that he saw too much novelty, which he could not comprehend; and even though he could see both near and remote objects very well, he would nevertheless continually have recourse to the use of the sense of touch.

Such are the nature of our impressions in early infancy, before vision becomes to us a true exposition of the forms and relative positions of objects. And such is the effect of habit and association, that the actual deceptions which the sense of sight, when taken alone, is continually presenting to us, can only be appreciated or detected by the philosophic inquirer.

THE COUNTESS IDA OF HAHN-HAHN.

DURING the last ten years, the authoress whose name heads this article has obtained an extensive popularity in Germany. Though a woman of undoubted genius, she is somewhat eccentric—a peculiarity over which her parentage and education must have exercised much influence. Her father, Count Charles Frederick von Hahn, served in the army of the Grand Duke of Mecklenberg-Schwerin in the war which was put an end to at Waterloo. Unfortunately, he had a passion for theatricals, and when peace was proclaimed, the count absented himself from his estates at Tressow, in Mecklenberg, and actually became the manager of a company of players. He so impaired his property by indulgence in his favourite pursuit, that it was found necessary to place it in the hands of trustees. Another consequence of his erratic mode of life was, that his daughter's childhood was deprived of the advantages of a settled home, and of the immediate guidance and direction of a father. She lived with her mother at Rostock, then in New Brandenburg, and, after 1821, in the Griefswald, where she was married in 1826 to the wealthy Count Frederick William Adolphus von Hahn, of the older branch of the house of Hahn, or Hahn Baselow. This union was productive of much unhappiness, and was dissolved in the year 1829. Nor were all the countess's troubles consequent on the marriage state. It was her misfortune to be afflicted with the peculiarity of vision known as a 'squint'; and, attracted by the fame of the celebrated Dr Dieffenbach, she allowed him to operate; but the result was unfavourable. After a time she lost the use of one eye entirely, and was for some time apprehensive of becoming totally blind. This incident made a great noise in Germany, for it created a furious paper war between the oculist and his impetuous patient. He maintained that she lost her sight from imprudently reading and writing by candle-light on the very evening after the operation; she, on the other side, persisting that the whole blame was attributable to the negligence of her medical attendant after the operation was performed. So perseveringly was the dispute carried on, that the countess's eye became the current topic of conversation in all the literary and medical circles of society throughout Germany.

To console herself for her misfortunes, the countess took to literature and travelling; and those who have watched her career, must admit that, if activity and industry be any consolation for trouble, she must have completely forgotten hers. Since 1835, she has visited Switzerland, Vienna twice, Italy twice, Spain, France, Sweden, Syria, and Constantinople. Since the same date she has written seven novels and five books of travel, not one of which but has met with a large share of public attention; some of them having been translated into both French and English.

The novels of this authoress, though adapted for German tastes, would find little favour with our more matter-of-fact nation. They abound in over-wrought delineations of passion and sentiment, and with events a little too melodramatic to be probable. From her books of travel, on the contrary, much that is sensible in opinion and graphic in description is to be

gleaned, and it is our present purpose to afford our readers a few specimens of this eccentric but amusing lady's literary skill and humour as a descriptive tourist.

Among her most diverting descriptions, is that which occurs in 'A Traveller's Letters' (Reisebriefe) on the Spanish roads. Crossing the Pyrenees from France near the Mediterranean, she halts at Figueras to dine, and there the French vehicle in which she had been recently travelling was exchanged for a Spanish one drawn by no fewer than nine mules. 'I could hardly believe my eyes when I saw the whole herd getting into motion. In Germany, we are thankful if our coachman is able to drive four in hand; but only think of a man undertaking to manage nine steeds at once! Each mule had its particular name, such as Pajarito, Galando, Amorosa, &c. The *mayoral* (so the coachman is called) kept up a constant conversation with his cattle, calling the creatures by name, scolding the lazy, praising the diligent, and guiding the whole team apparently more by his voice than with his reins. By the side ran the *zagal*, a boy with a whip, who contributed his share to the animation of the coursers, threw himself upon the front mule when we crossed a river or passed a sharp corner, and when he was tired of running, jumped up beside the *mayoral*, and rested for a few minutes on the driver's seat. The roads were frightful—indescribably so. At Perpignan they told me the chaussée to Barcelona was as good as a French road. This was saying little enough; but the fact is, that after we had got clear of the Pyrenees, we found no road at all, but had to ford rivers, to drive through ditches, to cross bogs, and to climb over precipices, and all that the best way we could. Roads and bridges, and everything that should be cared for by a government, are deplorably neglected.'

In an article on a book called 'Beyond the Mountains,' which we drew up some time since,* we extracted a not dissimilar passage. It turns out that the '*Man of Fashion*,' who wrote under the name of Theophile Gautier, was no other than the Countess Ida! She certainly kept up her assumed character admirably.

The work from which the above extract is taken abounds in shrewd reflections on the fallen condition of Spain. The following is piquant and true:—'Alas! to be poor is no greater hardship than to be rich, for our wants increase with our power of gratifying them; but to become poor, that is bitter; for it carries with it an involuntary feeling of a fall! How much more, then, when it is a nation that has become poor. Spain is not poor, they will tell me, for it possesses inexhaustible resources within its own soil; but of what worth are those resources to people who know not how to bring them into play? In the time of the Moors, Spain contained twenty millions of inhabitants—some say thirty—now it does not contain ten. The land was then rich and flourishing, and sufficed for all the wants of a luxurious population. Of course it must then have possessed resources that became dormant in proportion as the population melted together. The land remains uncultivated, because roads and canals are wanting for the conveyance of its produce. The plains of Castile grow the finest wheat in the world, and when grown, it is given to the pigs, because the grower has no means of conveying it to a market. There is no trade except along the coast, and even there it is almost exclusively in the hands of smugglers. The land that once monopolised the trade of both the Indies—the land that could fit out the Invincible Armada for the conquest of England—possesses at present not a single man-of-war, and has no commerce but what is carried on by smugglers!'

During her subsequent journey through Sweden, the countess visited that interesting personage, Miss Frederika Bremer, whose quiet pictures of northern domestic life have rendered her so celebrated throughout the rest of Europe. 'I visited Miss Frederika Bremer at Arsta, which is her estate. It is three Swedish miles from Stock-

* A Man of Fashion in Spain; vol. 12, p. 300.

holm : she lives there with her mother and younger sister during the greater part of the year. The two last-mentioned ladies passed last winter in Nizza. She remained at home : she does not like the trouble and disturbance of travelling. She remained seven months—seven Swedish winter months—all alone at Arsta, without seeing any one but the maid-servant who attended her. I would not believe that any one could endure such seclusion, if she had not told it me herself. Arsta has its little historical recollections. In the great meadow, Gustavus Adolphus assembled and mustered the army with which he first went as king to Livonia, and he dwelt with his wife and daughter in the wooden house which still stands near the present dwelling-house. The latter is of stone, square and handsome, with large lofty rooms : it was built during the thirty years' war. The surrounding country is not cheerful—at least it did not appear so to me, perhaps because it was a dull, cloudy day. The trees looked dingy, the lawn gray, and the sea was faintly seen in the distance. A walk was proposed, but I, who am generally so fond of the fresh air, preferred not going out : without there was nothing to tempt me, and within it was so comfortable. I can understand that one must feel very much attached to home here. I begged Miss Frederika to show me her room : it is as simple as a cell. To me it would be in the highest degree uncomfortable, for it is a corner room, with a window on two sides, so that there is a thorough light, and no curtains. Three square tables stand in it, entirely covered with books, papers, and writing apparatus ; and the rest of the furniture is in a style which seems simply to invite one to sit down upon sofa and chair, but not to lie down, or lean or lounge upon them, as I would willingly have done. It is the same with me on a journey as at home. I take a fancy to some particular table or chair, and the want of elegance or convenience is displeasing to me. Wherever I am travelling or living, I must have everything comfortable and soft and warm about me ; not so much hard wood, or so many sharp corners. On the walls of this room there are a few pictures. "That is a genuine Teniers ; but I know you will not like it," said Miss Bremer, smiling, and pointing to a picture which represents a peasant filling his tobacco pipe. I said frankly that I did not. I very often said "no" when she said "yes ;" but that did not signify.

* * She succeeded in conquering the difficulty of speaking in a language in which she is not accustomed to think, and said what she wished to say quite simply, naturally, and clearly, sometimes in French, sometimes in German. She has beautiful, thoughtful eyes, and a clear, broad, I might almost say a solid, forehead, with distinct, finely-marked eyebrows, which move when she speaks, especially when a sudden thought bursts into speech : this is very becoming to her. She has a small and light figure, and was dressed in black silk. In her antechamber there were two large book-cases filled with books in Swedish, German, French, and English : I think there were Italian also. In the schools, German is taught after Swedish. Goethe and Schiller have never been translated into Swedish, yet every one has read them. Our books have a much greater advantage in Sweden than Swedish books have with us. Translations are always colourless lithographs of the original, and sometimes they are wretched daubs. Miss Bremer draws portraits extremely well in miniature with water-colours, and has a very interesting album of such heads, all executed by herself, to which she has added mine. These two authoresses present a striking contrast. The guest a dashing, fashionable countess, fond of gaiety and the world ; the hostess a humble-minded, unpretending private gentlewoman, living in peace and retirement.

None of the countess's works have met with such an extended popularity as her 'Letters of a German Countess,' written from, and on her way to, the East. Several English translations have been made from them ; that before us being by the clever author of 'Caleb Stukely.' In the letter to her brother dated from Pesth, there is some useful information conveyed

with the countess's peculiar vivacity. 'We reached Pesth during the celebration of one of the four great fairs held annually in the city. The inns, coffee-houses, and restaurants of every grade are thronged with people, and the streets are one great sea of traffic. On the other side, at Ofen, matters are as quiet. Ofen is the older and smaller town, lying on the hill-side. High up, on the right, is the castle, the residence of the palatine ; on the left is the observatory : various government buildings and a few convents are seen in different directions. From the heights you overlook not only the river and all Pesth, which, by the way, lies very low, and is on that account seriously exposed to inundations, but the country far and wide in its level uniformity. Pesth, in other respects, is a handsome, regularly built town, with large houses and straight streets ; 60,000 inhabitants (whose trade and commerce are much facilitated by low position and proximity of water), a pretty theatre, a museum now building, and a chain-bridge in embryo. The completion of the last is impeded, as I hear, by the determination of the Hungarian nobles not to pay the toll which is indispensable to the defraying of the expenses. They maintain that the people hitherto have paid it, and that they shall continue so to do.

'Ofen and Pesth have so arranged matters, that they represent the capital of Hungary between them ; for the former is the seat of the palatine of the empire, and of the high political and military authorities, whilst the latter is the central point of Hungarian commerce. As for curiosities, grand buildings, antiquities, museums, and churches, Pesth knows of no such things ; nay, what is more astonishing, she is without a promenade, and that at Ofen is miserable in the extreme. Probably the folks prefer the Italian fashion of taking the air in a carriage, and if they do walk, to wander about the streets. And indeed the whole aspect of life here is very southerly. The people do not merely walk in the streets, but they actually sit, work, eat, drink, and sleep there. Every third house is a café, surrounded by a broad verandah, and supplied with sofas and blooming oleander trees ; and an incredible quantity of fruit—grapes, plums, melons, and water-melons—the latter in heaps—are exposed for sale. Lazzaroni-like, the unemployed labourers lie upon the thresholds of the house-doors, or across their own barrows, enjoying the luxury of a mid-day slumber. Women sit gossiping before the houses and suckling their young. The dark eye, the loud deep voice, and here and there the piercing glance, all are southern. * * Since for the last two days I have done nothing but roam from street to street, gazing right and left, I can speak of nothing but what my eyes encountered there. Oh, would that I could draw ! Is it not extraordinary that I can do nothing that I have been taught, at least for the teaching of which I have had masters, and that the only thing which I have not been taught, namely, to write a book, I can do ? I am really surprised that painters of domestic life do not come here : they might procure the finest subjects. Under the doorway of a spacious house, a fruiterer had very carelessly spread his commodities, consisting of water-melons, upon the ground ; he himself lay beside them, a beautiful oleander was above him, and in his mouth was the darling pipe, whose spiral cloud he watched intently as it ascended into air. The broad hat gave an additional shade to his already dark visage, and the contrast between his black, stern head, and the delicate rose-coloured blossoms which were waving above him, was splendid. The extensive trade in soap, entirely carried on in the open streets, is unpleasant to the eyes and nose, especially during the present melting weather. Hungary, with the Carpathian mountains to the north, is much warmer than the neighbourhood of Vienna, which lies north of the mountains of Styria. The exhibition of manufactures and works of industry, now open, was full of interest. The best productions are those of the cabinet-maker and leather-workers. The silks and minor articles of luxury look neither tasty

nor finished, as the English say, and as we Germans know not how to say, simply because the point itself is one we cannot reach.*

Arrived in Constantinople, the countess visited the slave-market, on which her observations are pointed and new. The market 'itself is not very inviting—an irregular space, surrounded by damp galleries. In these galleries sit the salesmen with coffee and *chibouque*, the overseers, the purchasers, and the simply curious; and in the narrow, dark, low chambers, which have a door and grated window opening to the galleries, are kept the noble wares. One group is placed in the middle of the court for inspection, or rather is seated, for they are squatted upon mats as usual. Let us contemplate them. Oh, horror! dreadful, revolting sight! Summon your whole faculty of imagination—picture to yourself monsters—and you still fail to conceive such objects as yon negroes, from whom your outraged eye recoils with loathing. But the Georgians, the Circassians—the loveliest women in the world—where are they? Not here! No, dearest brother, the white slaves are kept separate in Tophana; thence they are conducted to the harem for inspection, and only by the greatest favour, and under especial escort, can you be admitted to a view of them. Here are only blacks, and with the monstrous spectacle you must fain content yourself. There they sit! A coarse gray garment envelops the figure; coloured glass rings encircle the wrists; coloured glass beads the neck; the hair is cut short. You are struck, first, with the depressed forehead, squeezed over the eyebrows, as in the Cretins; then with the large, rolling, inexpressive eye; then with the nose, innocent of a bridge, a great misshapen mass; then with the mouth, and the frightful animal formation of projecting jaw-bone, and gaping black lips (red lips, on the Moor, is a European fancy, which reality does not sanction); then with the long-fingered, ape-like hands, and hideous colourless nails; then with the meagre spindleshanks and projecting heel; then, and most of all, with the incredible animalism of the whole thing, form and expression combined. The colour varies: here it is bright black, there somewhat brown, and here again grayish. They give out no signs of life; they stare at us with the same unconscious gaze that they fix upon each other. A purchaser approaches, examines them; women-buyers make their remarks upon them; they are indifferent to all. They are measured in their length and breadth like a bale of goods; scanned and tried in their hands, hips, feet, teeth, like a horse. They submit to everything without dislike, without anger, without sorrow. It is much that the exhibition proceeds with decency; that is to say, with so-called decency: the creatures do not lay aside their garments, which reach from the neck down to the calf of the leg. Now they are selected, bid for, cheapened. Do buyer and seller agree, the slave departs with her master or mistress. Do they not, she seats herself again upon the mat, unconcerned about her fate.

When in Egypt, the countess visited the residence of the pasha, Mehemet Ali, at Schubra, near Cairo, which 'is a garden on the Nile, with a country house, of which the viceroy is very fond. You can imagine nothing more pleasant and less pretending than the entrance into this garden. The gateway has acquired an irregular form from the mass of creeping plants with blue flowers which climb about it, and which give you the notion of entering beneath two trees. The garden itself does not at all resemble that of Ibrahim Pasha upon Rouda; it is more Oriental; that is to say, it is a fruit-garden, but very differently kept and tended to the wildernesses of Damascus. Firm paths, paved with shells and little pebbles, which enclose regular squares of oranges and lemons, and are bordered with lowly-cut hedges of myrtle; shady archways, that terminate at basins for water; elevated kiosks, with a prospect of the Nile, which streams through the fields like a flowing mantle of silver; such are the constituent parts. Let me, however, not forget the Great Fountain, which is really

superb. An oblong portico, borne by marble columns, surrounds a sheet of water, to which marble steps conduct, and upon which you can go about in small boats. In the four corners are fixed marble lions spouting forth water; and from the middle of the basin there rises a marble balcony upon crocodiles, who are also spitting water. Four pavilions, with chambers, are attached to the rounded edges of the portico, so that this fantastic building is really half fountain, halfiosk.' Of the pasha himself she adds, in a succeeding page: 'I wrote to you, dear Clara, how Mehemet Ali contrived to raise himself from the subordinate position of a captain of Albanian troops to be hereditary pasha of the empire of the Pharaohs. I saw the old pasha twice during my numerous promenades to Schubra, where his spring residence is situated. Everybody may visit the garden, even when he is in it; and as he always dines in the open air, amidst myrtle hedges and orange trees, close to a fountain, one can easily see him. I was once with Madame von Laurin in the beautiful marble fountain kiosk, when it was suddenly announced that he was coming. We saw no reason whatever why we should take flight, after the manner of Mahommedan women, and therefore remained as near as was permitted us. He politely greeted us. He has a small red countenance, a magnificent white beard, a somewhat stooping carriage, and the resolute but shaken gait of a robust old man. He wore the red tarbusch, and a dark-green robe, furred with sable. He receives foreigners with pipe and coffee, without any ceremony, introduced by their consuls. I asked my travelling companion what was the prevailing expression of his countenance. "Animated and friendly." "Something of the friendliness of the cat?" I inquired again. "Yes; somewhat, certainly." He was of opinion that if one could speak Turkish with him, one might hear many uncivilised but clever things: as it was, in spite of the tedious interpretation, he answered with great readiness, and well. He speaks only his bad Albanian Turkish; he cannot write at all: he learned to read at forty years of age—is not that pretty? Ibrahim Pasha (the pasha's son) speaks and writes Turkish, Persian, and Arabic. (*Apocryph* of this, it occurs to me to say that the Arabs have never learnt a word of Turkish. Here, if you please, is a genuine expression of hatred on the part of a people enslaved for 300 years). Ibrahim is said to have generally a more solid judgment, more deliberation, and more consistency in his transactions, than his father, who is subject to violent fits of passion; but Ibrahim is accused of avarice. He lives very much withdrawn from affairs at his country residence, Cube, on the road to Heliopolis, and comes rarely to his palace of Casar-el-Ain.'

As Germany is by no means overstocked with lively, vivacious writers, the countess has made some welcome additions to their literature. When not abroad, she resides alternately in Berlin and Dresden, receiving the homage due as much to her literary acquirements as to her rank and lineage.

BROCK THE SWIMMER.*

AMONGST the sons of labour, there are none more deserving of their hard earnings than that class of persons denominated Beachmen, on the shores of this kingdom. To those unacquainted with maritime affairs, it may be as well to observe, that these men are bred to the sea from their earliest infancy, are employed in the summer months very frequently as regular sailors or fishermen, and during the autumn, winter, and spring, when gales are most frequent on our coast, in going off in boats to vessels in distress in all weathers, at the imminent risk of their lives; fishing up lost anchors and cables, and looking out for waifs (that is, anything abandoned or wrecked) which the winds and waves

* We gather the present account of this remarkable man from a paper in the *Sporting Magazine* for July 1833.

may have cast in their way. In our supports these persons are usually divided into companies, between whom the greatest rivalry exists in regard to the beauty and swiftness of their boats, and their dexterity in managing them: this too often leads to feats of the greatest daring, which the widow and the orphan have long to deplore. To one of these companies, known by the name of 'Layton's,' whose rendezvous and 'look-out' is close to Yarmouth Jetty, Brock belongs, and of him the following anecdote is recorded.

About 1 P. M., on the 6th of October 1835, a vessel was observed at sea from this station with a signal flying for a pilot, bearing east distant about twelve miles. In a space of time incredible to those who have not witnessed the launching of a large boat on a like occasion, the yawl 'Increase,' eighteen tons burden, belonging to Layton's gang, with ten men and a London branch pilot, was under weigh steering for the object of their enterprise. 'I was as near as possible being left on shore,' said Brock to me; 'for at the time the boat was getting down to the breakers, I was looking at Manby's apparatus for saving the lives of persons on a wreck then practising, and but for the "singing out" of my messmates, which caught my ear, should have been too late; but I reached in time to jump in with wet feet.' About four o'clock they came up with the vessel, which proved to be a Spanish brig, *Paquette de Bilbao*, laden with a general cargo, and bound from Hamburg to Cadiz, leaky, and both pumps at work. After a great deal of chaffering and haggling in regard to the amount of salvage (always the case with foreigners), and some little altercation with part of the boat's crew as to which of them should stay with the vessel, T. Layton (a Gatt pilot), J. Woolsey, and George Darling, boatmen, were finally chosen to assist in pumping and piloting her into Yarmouth harbour. The remainder of the crew of the yawl were then sent away. The brig at this time was about five miles to the eastward of the Newarp Floating Light, off Winterton on the Norfolk coast, the weather looking squally. On passing the light in their homeward course, a signal was made for them to go alongside, and they were requested to take on shore a sick man, and the poor fellow being comfortably placed upon some jackets and spare coats, they again shoved off and set all sail (three lugs): they had a fresh breeze from the W. S. W. And now again my readers shall have Brock's own words:—'There was little better than a pint of liquor in the boat, which the Spaniard had given us, and the bottle had passed once round, each man taking a mouthful, and about half of it was thus consumed. Most of us had got a bit of bread or biscuit in his hand, making a sort of light meal, and into the bargain I had hold of the main-sheet. We had passed the buoy of the Newarp a few minutes, and the light was about two miles astern: we had talked of our job (that is, our earnings), and had just calculated that by ten o'clock we should be at Yarmouth.' This hope proved fallacious. 'Without the slightest notice of its approach, a terrific squall from the northward took the yawl's sails flat aback, and the ballast, which they had trimmed to windward, being thus suddenly changed to leeward, she was upset in an instant.'

This dreadful catastrophe plunged all who were on board the yawl or boat into the sea. 'It was terrible,' said Brock, 'to listen to the cries of the poor fellows, some of whom could swim, while others could not. Mixed with the hissing of the water and the howlings of the storm, I heard shrieks for mercy, and some that had no meaning but what arose from fear. I struck out, to get clear of the crowd, and in a few minutes there was no noise, for most of the men had sunk; and on turning round, I saw the boat was still kept from going down by the wind having got under the sails. I then swam back to her, and assisted an old man to get hold of one of her spars. The boat's side was about three feet under water, and for a few minutes I stood upon her; but I found she was gradually settling down, and when up to my chest, I again left her and swam away, and now for the first time began to think of my own awful condition. My companions were all drowned, at least I supposed so. How long it was up to this period from the boat's capsizing I cannot exactly say: in such cases, sir, there is no time; but now I reflected that it was half-past six P. M. just before the accident occurred; that the nearest land at the time was six miles distant; that it was dead low water, and the flood-tide setting off the shore, making to the southward; therefore, should I ever reach the land, it would take me at least fifteen miles setting up with the flood before the ebb would assist me.'

At this moment a rush horse-collar covered with old netting, which had been used as one of the boat's fenders, floated close to him, which he laid hold of, and, getting his knife out, he stripped it of the network, and, by putting his left hand through it, was supported till he had cut the waistband of his petticoat trousers, which then fell off. His striped frock, waistcoat, and neckcloth, were also similarly got rid of; but he dared not try to free himself of his oiled trousers, drawers, or shirt, fearing that his legs might become entangled in the attempt: he therefore returned his knife into the pocket of his trousers, and put the collar over his head, which, although it assisted in keeping him above water, retarded his swimming: and after a few moments, thinking what was best to be done, he determined to abandon it. He now, to his great surprise, perceived one of his messmates swimming a-head of him, but he did not hail him. The roaring of the hurricane was past; the cries of drowning men were no longer heard; and the moonbeams were casting their silvery light over the smooth surface of the deep, calm and silent as the grave over which he floated, and into which he saw this last of his companions descend without a struggle or a cry as he approached within twenty yards of him.

Up to this time Winterton Light had served, instead of a land-mark, to direct his course; but the tide had now carried him out of sight of it, and in its stead 'a bright star stood over where' his hopes of safety rested. With his eyes steadfastly fixed upon it, he continued swimming on, calculating the time when the tide would turn. But his trials were not yet past. As if to prove the power of human fortitude, the sky became suddenly overclouded, and 'darkness was upon the face of the deep.' He no longer knew his course, and he confessed that for a moment he was afraid; yet he felt that 'fear is but the betraying of the succours which reason offereth,' and that which roused him to further exertion would have sealed the fate of almost any other human being—a sudden short cracking peal of thunder burst in stunning loudness just over his head, and the forked and flashing lightning at brief intervals threw its vivid fires around him. This, too, in its turn passed away, and left the wave once more calm and unruffled: the moon (nearly full) again threw a more brilliant light upon the bosom of the sea, which the storm had gone over without waking from its slumbers. His next effort was to free himself from his heavy-laced boots, which greatly encumbered him, and in which he succeeded by the aid of his knife. He now saw Lowestoft High Lighthouse, and could occasionally discern the tops of the cliffs beyond Gorleston on the Suffolk coast. The swell of the sea drove him over the Cross-sand Ridge, and he then got sight of a buoy, which, although it told him his exact position, as he says, 'took him rather aback,' as he had hoped he was nearer the shore. It proved to be the chequered buoy of St Nicholas Gatt, off Yarmouth, and opposite his own door, but distant from the land four miles. And now again he held council with himself, and the energies of his mind seemed almost superhuman: he had been five hours in the water, and here was something to hold on by: he could have even got upon the buoy, and some vessel might come near to pick him up; and the question was, could he yet hold out four miles? But, as he says, 'I knew the night air would soon finish me, and had I stayed but a few minutes upon the buoy, and then altered my mind, how did I know that my limbs would again resume their office?' He found the tide (to use a sea term) was broke. It did not run so strong; so he abandoned the buoy, and steered for the land, towards which, with the wind from the eastward, he found he was now fast approaching. The last trial of his fortitude was now at hand, for which he was totally unprepared, and which he considers (sailors being not a little superstitious) the most difficult of any he had to combat. Soon after he left the buoy, he heard just above his head a sort of whizzing sound, which his imagination conjured into the prelude to the 'rushing of a mighty wind,' and close to his ear there followed a smart splash in the water, and a sudden shriek that went through him, such as is heard

'When the lone sea-bird wakes its wildest cry.'

The fact was, a large gray gull, mistaking him for a corpse, had made a dash at him, and its loud discordant scream in a moment brought a countless number of these formidable birds together, all prepared to contest for and share the spoil. These large and powerful fowls he had now to scare from their intended prey, and by shouting and splashing

with his hands and feet, in a few minutes they vanished from sight and hearing.

He now caught sight of a vessel at anchor, but a great way off, and to get within hail of her he must swim over Corton Sands (the grave of thousands), the breakers at this time showing their angry white crests. As he approached, the wind suddenly changed, the consequence of which was, that the swell of the sea met him. And now again for his own description:—'I got a great deal of water down my throat, which greatly weakened me, and I felt certain that, should this continue, it would soon be all over, and I prayed that the wind might change, or that God would take away my senses before I felt what it was to drown. In less time than I am telling you I had driven over the sands into smooth water, the wind and swell came again from the eastward, and my strength returned to me as fresh as in the beginning.'

He now felt assured that he could reach the shore, but he considered it would be better to get within hail of the brig, some distance to the southward of him, and the most difficult task of the two, as the ebb tide was now running, which, although it carried him towards the land, set to the northward; and to gain the object of his choice would require much greater exertion. But, said Brock, 'If I gained the shore, could I get out of the surf, which at this time was heavy on the beach? And supposing I succeeded in this point, should I be able to walk, climb the cliffs, and get to a house? If not, there was little chance of life remaining long in me; but if I could make myself heard on board the brig, then I should secure immediate assistance. I got within two hundred yards of her, the nearest possible approach, and summoning all my strength, I sung out as well as I had been on shore.' Brock was fortunately answered from the deck, a boat was instantly lowered, and at half-past 1 a.m., having swam seven hours in an October night, he was safe on board the brig Betsy of Sunderland, coal laden, at anchor in Corton Roads, fourteen miles from the spot where the boat was capsized.

Once safe on board, 'nature cried enough,' he fainted, and continued insensible for some time. All that humanity could suggest was done for him by the captain and his crew; they had no spirits on board, but they had bottled ale, which they made warm; and by placing Brock before a good fire, rubbing him dry, and putting him in hot blankets, he was at length, with great difficulty, enabled to swallow a little of the ale; but it caused excruciating pain, as his throat was in a state of high inflammation from inhaling so long the saline particles of sea and air, and it was now swollen very much, and, as he says, he feared he should be suffocated. He, however, after a little time, fell into a sleep, which refreshed and strengthened him, but he awoke to intense bodily suffering. Round his neck and chest he was perfectly flayed: the soles of his feet, his hands, and his hamstrings, were also excoriated. In this state, at about 9 a.m., the brig getting under weigh with the tide, he was put on shore at Lowestoft in Suffolk, whence he immediately despatched a messenger to Yarmouth with the sad tidings of the fate of the yawl and the rest of her crew.

Being now safely housed under the roof of a relative, with good nursing and medical assistance, he was enabled to walk back to Yarmouth in five days from the time of the accident. The knife, which he considers as the great means of his being saved, is preserved with great care, and in all probability will be shown a century hence by his descendants. It is a common horn-handled knife, having one blade about five inches long. A piece of silver is now riveted on, and covers one side, on which is the following inscription, giving the names of the crew of the yawl when she upset:—'Brown, Emmerson, Smith, Bray, Budds, Fern, Rushmere, Boulton: Brock, aided by this knife, was saved after being seven and a half hours in the sea, 6th Oct. 1835.'

'It was a curious thing, sir,' said Brock, as I was listening to his extraordinary narrative, 'that I had been without a knife for some time, and only purchased this two days before it became so useful to me; and having to make some boat's tholes, it was as sharp as a razor.'

I know not what phrenologists might say to Brock's head, but I fancied, whilst studying his very handsome face and expression of countenance, that there I could see his heart. His bodily proportions, excepting height, are Herculean, standing only 5 feet 5 inches high; his weight, without any protuberance of body, is 14 stone; his age at the time spoken of was 31; his manners are quiet, yet com-

municative; he tells his tale neither tainted by bombast nor any clap-trap to awaken the sympathies of those of the 'Wrexhill school' that have flocked about him. In the honest manliness of his heart he thus addressed me just before parting:—'I always considered Emmerson a better swimmer than myself; but, poor fellow, he did not hold out long. I ought to be a good-living chap, sir, for three times have I been saved by swimming.'

One trait more, which he did not tell me, and I have done. A very good subscription was made for the widows and children of Brock's unfortunate companions, and a fund being established for their relief, the surplus was offered to him. This was his answer:—'I am obliged to you, gentlemen, but, thank God, I can still get my own living as well as ever, and I could not spend the money that was given to the fatherless and the widow.'

We may add, that Brock still survives, and is by no means a stranger to the inhabitants of Yarmouth and its neighbourhood, or the numerous visitors who frequent this part of the coast.

UTILITY OF BIRDS.

Of late, says the *Gardeners' Chronicle*, our columns have been occupied by a discussion concerning the merits and demerits of certain small birds. It would seem that these creatures are incarnations of mischief, if the one party is to be credited; while the other maintains that they are the winged instruments of prosperity. S. declares that he would not have a gooseberry if he left a tit alive. T. as stoutly asserts that neither gooseberries nor anything else will be left if the tits are destroyed. We have thought it advisable to give this discussion full scope, because it may be truly regarded as one of the more important of the questions incidentally connected with gardening, and, moreover, one concerning which there is the most marvellous ignorance. Thousands of people imagine that birds live on nothing but corn and fruit, and are therefore supported at the personal expense of those who grow corn and fruit, without making any sort of return. 'What, say they, is the use of such things? We can't eat them; and there is no good in feeding a swarm of useless plunderers.' And therefore, because of this wise conclusion, the order is given to shoot, trap, and poison without mercy. Let us hope, however, that the arguments in favour of birds, to which we have lately given so much space, will have removed this error, and that the question between man and birds will have reduced itself to whether the balance of good is in favour of the latter or against them.

It would be idle to assert that birds consume nothing which, but for them, we might consume ourselves. They feed in part at our expense. They destroy the insects that infest our gardens, when they can find any; and when the insects are gone, they search for other food. The first is their labour, the second is their wages. And is not the workman worthy of his hire? The man who grudges a bird a little seed or fruit, might as well begrudge his weekly pay to the labourer. There is no doubt that a garden would be less expensive if all the work in it were done for nothing. If a master would pocket his servants' wages, he would have more to spend upon himself. But this sort of arrangement is not exactly consistent with the design of Providence; and we are sure that it would not meet with the approbation of either S. or T. We repeat it, then, let us look at birds as skilful workmen, and the fruit or seed which they eat as the coin in which they are paid their wages. Not that birds are an unmixed good. Is man himself? Is anything? There are situations, doubtless, where birds are an absolute nuisance. Imagine, for instance, a garden surrounded by a wood which swarms with blackbirds. Does any one suppose it possible to gather a ripe cherry in such a place? If he does, he is greatly mistaken. He would find the blackbird a much more dexterous gatherer than himself, and one who would relieve him from all trouble with his cherry crop. In such a case the birds must be trapped, or the crop abandoned. There would be no alternative.

But such instances are special, and form the exception, not the rule. Every day's experience tells us that birds are among the most efficient instruments of Providence for destroying the vermin that would otherwise overrun us. And people may rely upon it, that they cannot more effectually encourage the ravages of those insidious foes than by waging war upon the creatures which naturally feed upon them.

DIALOGUE ON A DRY BOOK.

B. Tragedians, if they read it, leave off their whey faces, and become dry drols.

A. It was the author of Liston's melancholy.

B. And Charles Kemble's taking to comedy.

A. Sir, I can believe that: I know the virtues as well as the vices of the work too well to doubt it. As another instance, an enemy to unions of all kinds has for twenty years prevented the junction of two convenient canals, by obstinately keeping this book in his library, situated midway between the two water-parties.

B. Oh, that's nothing! A publican, owing to the swampiness of his ground, lost all his skittle-players. A true friend, I should call him, recommended him to try this book: he did yesterday, and to-day he has had repainted over his door, 'An undeniably dry ground for skittles!'

A. A man who carried the book about him for a day was afflicted with a dry cough all the days of his life.

B. The toll-tickets of a turnpike-road in Wales are printed by the same man who reprinted it. The London hackney-coachmen go down there, take a ticket, drive through the gate, return, and are dry for life.

A. A man living in a damp house kept a copy in his bedroom, and waked in the morning in a fever.

B. A gardener wrapped a water-melon in a waste sheet, and on cutting it open, it was as dusty as a dried poppy.

A. They cover warehouses for dry goods with it instead of slates, and it answers the purpose admirably.

B. A hatter makes waterproof beavers by pasting an inch of it inside.

A. A bunch of grapes bagged in it, in half an hour became raisins.

B. They dry grasses for winter fodder for cattle by reading a chapter of it through the fens of Lincolnshire.

A. If you put a page of it in a hay-rick, it never fires from damp.

B. A cow, milked by a Welshwoman who had merely said she should like to read it, never yielded a drop of milk afterwards.

A. Washerwomen recite a passage of it, and take down their clothes—dry! They have sold their drying-grounds in consequence.

B. Innkeepers keep the book in one of their bedrooms, and they want no warming-pans in the rest.

A. Dry-nurses find it the shortest method of weaning children. Two sentences out of it will make any swaddled young gentleman so thoroughly satisfied, that he will decline taking in his afternoon milk as usual.—*Webb's Glances at Life in City and Suburb: 1845.*

PERSONAL IMPROVEMENT.

If the proper study of mankind is man, it is proper only so far as it may conduce to our own advancement in righteousness, by making us acquainted with that weakness and corruption of our nature which self-love is for ever labouring to conceal. Should we forget to apply to our own individual cases the observations which we make in the case of others, our knowledge will not only be barren of improvement, but may even serve to engender a censorious spirit, and increase that pride and presumption which we know too frequently attend the mere possession of speculative knowledge. Our own personal improvement is the centre towards which all reflections upon the nature and actions of man should converge; and whatsoever tends to unfold and bring to light any weakness lurking in the heart, should be received on our parts with all the readiness and impartiality which become creatures who are conscious of their responsible condition, and of that higher destiny which is to succeed this probationary life.—*J. S. M. Anderson.*

HUMAN LIFE.

Though we seem grieved at the shortness of life in general, we are wishing every period of it at an end. The minor longs to be of age, then to be a man of business, then to make up an estate, then to arrive at honours, then to retire.—*Spectator.*

JUDGING.

As the best writers are the most candid judges of the writings of others, so the best lives are the most charitable in the judgments they form of their neighbours' actions.—*Seel.*

THE MAN IN THE FOREST, OR THE EMIGRANT.

[FROM THE GERMAN OF FREDERICK FRIELIGRATH.]

The forest, cool and green—

The forest, wild and free—

Must shield the warworn banished man,

For not a friend has he.

All in the tomb his dear ones laid,
And he must seek the forest shade!

And he has sought his home,

And made it long ago,

There, where the wild wood winds its way

Into the vale below,

A house of houses: the gray-rock door

With swinging branches is wanton'd o'er.

His bed a couch of leaves—

Leaves as yellow as gold;

While for a roof the branches weave

Their arms in flexile fold:

Oh joy! to inhabit this moss-crowned cave—

The fir and the beech trees surrounding wave.

Around the porch they weave,

And, stooping, strive to win

A glance of the stream that flows without,

And forms a bath within;

For there, in the grot so softly bright,

A fountain it flows, in liquid light!

And there a rough stone grate

Affords a warm fireside;

And there, when the snow storm whistles round,

The lonely man doth hide.

The stalactite walls that around him shine

Are his forest treasures' sacred shrine.

And there his heart is free

From discontent and care,

And lives throughout the wintry day

On hoarded flesh of bear.

But hark! at length the forest rings

With wild notes from each bird that sings!

And twinkling forth, each bud

Peeps from its leafy nest,

Soon as the blooming spring outpours

Sap from her dewy breast:

And the downy buds of the walnut tree

Wave through the forest all gladsomely.

High singing from the boughs,

The joyous finch and thrush

Proclaim the spring; while from his lair

Behold the exile rush!

He bounds, he flies from his cleft in the rock,

And fells the young trees with a sturdy shock;

Collects with tender care

The saplings young, and then

Rejoicing on his way he goes,

And seeks the abodes of men:

Thus to the market his store he brings,

While through the valley his wild song rings:—

'With young trees laden, all to sell,

I hie me to the city;

Let me, sweet spring, thy praises tell,

Who hast shown me wondrous pity.

These dew pearls bright, this moisture balm,

Into this heart is stealing—

The dewy oak, the alder, palm,

Each to my heart appealing,

Tell of their kindred gem—the tear

Of joy, the eye's tear-gladden!

That, silent stealing, stays each fear,

And soothes the exile's sadness.

The busy, noisy, bustling town,

Perplexed with cares the sorest,

Where charcoal fumes the kilns burn brown:

But you, my leafy forest,

Sweet spring, and all your holy train,

Will make and keep me pure again!

The song, soft-flowing, ceased:

The dweller of the cave

Hied with his burthen gaily on;

Took what the buyer gave,

And wends him, glad of the release,

Back to his forest home in peace.

SIR WALTER SCOTT AND WILLIAM LAIDLAW.

FIRST ARTICLE.

THE recent death of Mr William Laidlaw, a man of fine natural powers and of most estimable character, removes another of the links which connected the present generation with the daily-life and personal history of Sir Walter Scott, and with the antique minstrelsy and simple manners of the Scottish Borders. The loss of Hogg, while the strong twilight from Scott's departed greatness still shone on the land, was universally regretted, and now another 'flower of the forest,' less bright, but a genuine product of the soil, is 'wede away,' and can never be replaced. As the author of one of our sweetest and most characteristic Scottish ballads—'Lucy's Flittin'—and as a collaborateur with Scott in the collection of the ancient minstrelsy, Laidlaw is entitled to honourable remembrance. Let us never forget those who have added even one wild rose to the chaplet of Scottish song and patriotism! It is chiefly, however, as the companion, factor, and private secretary of Scott, that this gentleman will be known in after-times. During all those busy and glorious years when Scott was pouring out so prodigally the treasures of his prose fictions, and building up his baronial romance of Abbotsford, Laidlaw was his confidential adviser and daily assistant. From 1817 to 1832 he was resident on the poet's estate, and emphatically one of his household friends. Not a shade of distrust or estrangement came between them; and this close connexion, notwithstanding a disparity in circumstances and opinions, in fame and worldly consequence, is too honourable to both parties to be readily forgotten. The manly kindness and consideration of one noble nature was paralleled by the affectionate devotion and admiration of another. Literary history is brightened by the rare conjunction.

Scott's early excursions to Liddesdale and Ettrick form one of the most interesting epochs in his life. He was then young, not great, but prosperous, high-spirited, and overflowing with enthusiasm. His appointment as sheriff had procured him confidence and respect. He had 'given hostages to fortune' as a husband and a father—and no one felt more strongly the force and tenderness of those ties. Friends were daily gathering round him: his German studies and ballads inspired visions of literary distinction, and he was full of hope and ambition. In his Border *raids*, he revelled among the choice and curious stores of Scottish poetry and antiquities. Almost every step in his progress was marked by some memorable deed or plaintive ballad—some martial achievement or fairy superstition. Every tragic tale and family tradition was known to him. The old *peels* or castles, the bare hills, and treeless forest, and solitary streams, were all sacred in his eyes. They told of times long past—of warlike feuds and

forays—of knights and freebooters, and of primitive manners and customs, fast disappearing, yet embalmed in songs, often rude and imperfect, but always energetic or tender. Thus the Border towers, and *burns*, and rocks, were equally dear to him as memorials of feudal valour, and as the scenes of lyric poetry and pastoral tranquillity. He contrasted the strife and violence of the warlike Douglasses, the Elliots and Armstrongs, with the peace and security of later times, when shepherds ranged the silent hill, or Scottish maidens sang ancient songs, and, like the Trojan dames,

Washed their fair garments in the days of peace.

Much of this romance was in the scene, but more was in the mind of the beholder.

William Laidlaw's acquaintance with Scott commenced in the autumn of 1802, after two volumes of the Minstrelsy had been published, and the editor was making collections for a third. The eldest son of a wealthy and respectable sheep-farmer, Mr Laidlaw had received a good education. He had a strong bias for natural history and poetry, was modest and retiring, and of remarkably mild and agreeable manners.* The scheme of collecting the old ballads of the Forest was exactly suited to his taste. Burns had filled the whole land with a love of song and poetry—James Hogg was his intimate friend and companion. Hogg had been ten years a shepherd with Mr Laidlaw's father, had taught the younger members of the family their letters, and recited poetry to the old, and was engaged in every *play* and pursuit at Blackhouse, the name of the elder Laidlaw's farm. A solitary and interesting spot is Blackhouse—a wild extensive sheep-walk, with its complement of traditional story, and the suitable accompaniment of a ruined tower. The farm lies along the Douglas-burn, a small mountain stream which falls into the Yarrow about two miles from St Mary's Loch. Near the house, at the foot of a steep green hill, and surrounded with a belting of trees, is Blackhouse Tower, or the Tower of Douglas, so called, according to tradition, after the Black Douglas, one of whose ancestors, Sir John Douglas of Douglas-burn, as appears from Godscroft's history of the family, sat in Malcolm Canmore's first parliament. The tower has in one corner the remains of a round turret, which contained the stair, and the walls rise in

* Mr Laidlaw was born at Blackhouse, Selkirkshire, in November 1780. He was afterwards tenant of a farm at Traquair, and of another at Libberton, near Edinburgh. From 1817 to 1832, as stated in the text, he resided on the estate of Abbotsford. After Scott's death, Mr Laidlaw was successively factor on the estates of Seaforth and Balmagown, in Ross-shire. His health failing, he went to live with his brother, Mr James Laidlaw, sheep-farmer at Contin, in the county of Ross, where he died on the 18th of May 1845. He was buried in Contin churchyard, a retired spot under the shade of the lofty Tor-Achilty, and amidst the most enchanting Highland scenery.

high broken points, which altogether give the ruin a singular and picturesque appearance. It is also the scene of a popular ballad, 'The Douglas Tragedy,' in which, as in the old Elizabethan dramas, blood is shed and horrors accumulated with no sparing hand. A knightly lover, the 'Lord William' of so many ballads, carries off a daughter of Lord Douglas, and is pursued by this puissant noble and his seven sons. All these are slain by Lord William, while the fair betrothed looks on, holding his steed; and the lover himself is mortally wounded in the combat, and dies ere morn. The lady also falls a prey to her grief; and, in the true vein of antique story and legend, we are told

'Lord William was buried in St Mary's kirk,
Lady Margaret in Mary's quire;
Out o' the lady's grave grew a bonny red rose,
And out o' the knight's a brier.

The tower and legend interested Scott as they had done Laidlaw. He listened attentively to the traditionary narrative, and, like the lovers in the ballad,

He lighted down to take a drink
Of the spring that ran so clear,

and visited the seven large stones erected upon the neighbouring heights of Blackhouse to mark the spot where the seven brethren were slain.

Mr Laidlaw was prepared for Scott's mission. He had heard from a Selkirk man in Edinburgh, Mr Andrew Mercer, that the sheriff was meditating a poetical raid into Ettrick, accompanied by John Leyden, and he had written down various ballads from the recitation of old women and the singing of the servant girls. He was constantly annoyed, he said, to find how much the affectation and false taste of Allan Ramsay had spoiled or superseded many striking and beautiful old strains of which he got traces and fragments, and how much Mr Scott was too late in beginning his researches, as many aged persons who had been the bards and depositaries of a former generation were then gone. In the course of his inquiries, Laidlaw learned that an old man, a relation of Hogg's, could repeat a grand heroic ballad of vast antiquity, which had never been published, and he procured from the Shepherd a copy of this precious relic, called 'Auld Maitland.' It was taken down from the recitation or chanting of Hogg's uncle, 'Will of Phawhope,' confirmed by his mother, both of whom had learned it from their father, an older Will of Phawhope—for the family had been herds in the Forest for many generations. These services of the olden time were marked by reciprocal kindness and attachment, not unworthy of the patriarchal age. Son succeeded father in tending the *hirsels* or herding the cows, while in the case of 'the master,' the same hereditary or family succession was very often preserved.

The person of the sheriff was not unknown to the new friend with whom he was afterwards destined to form so intimate a connexion. 'I first saw Walter Scott,' Laidlaw used to relate, 'when the Selkirk troop of yeomanry met to receive their sheriff shortly after his appointment. I was on the right of the rear-rank, and my front-rank man was Archie Park, a brother of the traveller. Our new sheriff was accompanied by a friend, and as they retired to the usual station of the inspecting officer previous to the charges, the wonderful springs and bounds which Scott made, seemingly in the excitement and gaiety of his heart, joined to the effect of his fine fair face and athletic appearance, were the cause of a general murmur of satisfaction, bordering on applause, which ran through the troop. Archie Park looked over his shoulder to me, and growled, in his deep rough voice, "Will, what a strong chield that would have been if his left leg had been like his right one!"'

Scott and Leyden duly appeared at Blackhouse, carrying letters of introduction. They put up their horses, and experienced a homely unostentatious hospitality, which afterwards served to heighten the delightful

traits of rustic character in the delineation of Dandie Dinmont's home at Charles-Hope. If the sheriff did not 'shoot a blackcock and eat a blackcock too,' the fault was not in his entertainers. After the party had explored the scenery of the burn, and inspected Douglas Tower, Laidlaw produced his treasure of 'Auld Maitland.' Leyden seemed inclined to lay hands on the manuscript, but the sheriff said gravely that he would read it. Instantly both Scott and Leyden, from their knowledge of the subject, saw and felt that the ballad was undoubtedly ancient, and their eyes sparkled as they exchanged looks. Scott read with great fluency and emphasis. Leyden was like a roused lion. He paced the room from side to side, clapped his hands, and repeated such expressions as echoed the spirit of hatred to King Edward and the southrons, or as otherwise struck his fancy. 'I had never before seen anything like this,' said the quiet Laidlaw; 'and though the sheriff kept his feelings under, he, too, was excited, so that his *bur* became very perceptible.*' Laidlaw had procured a version of another ballad, 'The Demon Lover,' which he took down from the recitation of Mr Walter Grieve, then in Craik, on Borthwick water. Grieve sung it well to a singularly wild tune, and the song embodies a popular but striking superstition, such as Lewis introduced into his romance of 'The Monk.' To complete the fragment, Laidlaw added the 6th, 12th, 17th, and 18th stanzas, and those who consult the ballad in Scott's *Minstrelsy* will see how well our friend was qualified to excel in the imitation of these strains of the elder muse. After the party had 'quaffed their fill' of old songs and legendary story, they all took horse, and went to dine with Mr Ballantyne of Whitehope, the uncle of Laidlaw.

'There was not a minute of silence,' says Mr Laidlaw's memorandum, 'as we rode down the narrow gles, and over by the way of Dryhope, to get a view of St Mary's Loch and of the Peel or Tower. When we en-

* As they fared up o'er Lammermore,
They burned bath up and down,
Until they came to a darksome house;
Some call it Lender-Town.

'Wha hauds this house?' young Edward cried,
'Or wha gies't ower to me?'
A gray-haired knight set up his head,
And crackit right crounsly:

'Of Scotland's king I haud my house;
He pays me meat and fee;
And I will keep my gude auld house
While my house will keep me.'

They laid their sowies to the wall,
Wi' mony a heavy peal;
But he throw ower to them again
Baith pitch and tar barrel.

With springalds, stanes, and gads of airo,
Among them fast he threw;
Till mony of the Englishmen
About the wall he slew.

Full fifteen days that braid host lay,
Steging auld Maitland keen,
Synce they hae left him, hall and fair,
Within his strength of stane.

Ballad of Auld Maitland.

Scott valued this ballad, and his other lyrical acquisitions, highly. In a letter to Mr Laidlaw, dated 21st January 1833, he remarks as follows:—'Auld Maitland, laced and embroidered with antique notes and illustrations, makes a most superb figure. I have got, through the intervention of Lady Dalkeith, a copy of Mr Beattie of Melkildale's "Tamblane." It contains some highly poetical stanzas descriptive of fairy-land, which, after some hesitation, I have adopted, though they have a very refined and modern cast. I do not suspect Mr Beattie of writing ballads himself, but pray will you inquire whether, within the memory of man, there has been any poetical clergyman or schoolmaster whom one could suppose capable of giving a coat of modern varnish to this old ballad. What say you to this, for example?—

We sleep on rose-buds soft and sweet,
We revel in the stream,
We wanton lightly on the wind,
Or glide on a sunbeam.

This seems quite modern, yet I have retained it.'

tered the Hawkshaw-doors, a pass between Blackhouse and Dryhope, where a beautiful view of the lake opens, Leyden, as I expected, was so struck with the scene, that he suddenly stopped, sprung from his horse (which he gave to Mr Scott's servant), and stood admiring the fine Alpine prospect. Mr Scott said little; but as this was the first time he had seen St Mary's Loch, doubtless more was passing in his mind than appeared. Often when returning home with my fishing-rod had I stopped at this place, and admired the effect of the setting sun and the approaching twilight; and now when I found it admired by those whom I thought likely to judge of and be affected with its beauty, I felt the same sort of pleasure that I experienced when I found that Walter Scott was delighted with Hogg. Had I at that time been gifted with a glimpse—a very slight glimpse—of the second-sight, every word that passed, and they were not few, until we reached Whitehope or Yarrow church, I should have endeavoured to record. Scott, as all the world knows, was great in conversation, and Leyden was by no means a common person. He had about him that unconquerable energy and restlessness of mind that would have raised him, had he lived, very high among the remarkable men of his native country. I cannot forget the fire with which he repeated, on the Craig-bents, a half stanza of an irrecoverable ballad—

Oh swiftly far speed the berry-brown steed
That drinks o' the Teylot clear—

which his friend, when finally no brother to it could be found, adopted in the reply of William of Deloraine to the Lady of Branksome.

The regret that Laidlaw here expresses at having omitted to note down the conversation of his friends is extremely natural, but few men could be less fitted for such a task. He had nothing of Boswell in his mind or character. He wanted both the concentration of purpose and the pliant readiness of talent and power of retention. At Abbotsford, he had ample opportunities for keeping such a record, and he was often urged to undertake it. Scott himself on one occasion, after some brilliant company had left the room, remarked half jocularly, that many a one meeting such people, and hearing such talk, would make a very lively and entertaining book of the whole, which might some day be read with interest. Laidlaw instantly felt it necessary to put in a disclaimer. He said he would consider it disreputable in him to take advantage of his position, or of the confidence of private society, and make a journal of the statements and opinions uttered in free and familiar conversation. We may respect the delicacy and sensitiveness of his feelings, but society, collectively, would lose much by the rigid observance of such a rule. The question, we think, should be determined by the nature and quality of the circumstances recorded. It is a special, not a general case. There is nothing more discreditable in noting down a brilliant thought or interesting fact, than in repeating it in conversation; while to play the part of a gossiping and malicious eaves-dropper, is equally a degradation in life and in literature. It would have been detestable (if the idea could for a moment be entertained) for Mr Laidlaw to pry into the domestic details and personal feelings or failings of his illustrious friend at Abbotsford; but we may wish that his pen had been as ready as his ear when Scott ran over the story of his literary life and opinions, or discriminated the merits of his great contemporaries—when Davy expatiated on the discoveries and delights of natural philosophy—when Miss Edgeworth painted Irish scenes and character—when Moore discoursed of poetry, music, and Byron—when Irving knickered up like a poet in his recollections of American lakes, and woods, and old traditions—when Mackintosh began with the Roman law, and ended in Lochaber—when some septuagenarian related anecdotes of the past—when artists and architects talked of pictures, sculpture, and buildings—or when some accomplished traveller and *savant* opened up the interior of foreign courts and the pecu-

liarities of national manners. Many a wise and witty saying and memorable illustration—the life-blood of the best books—might thus have been preserved, though with occasional *lacuna* and mistakes; and all are now lost—

Gone glittering through the dream of things that were—

and cannot be recalled. Surely society is the worse for the loss of these racy, spontaneous fruits of intellect, study, and observation.

While dinner was getting ready at Whitehope, Laidlaw and Leyden strolled into the neighbouring churchyard of Yarrow, and saw the tomb of Mr Rutherford, the first minister of that parish after the revolution, and the maternal great-grandfather of Scott. Leyden recited to his companion the ballads of 'The Eve of St John' and 'Glenfinlas,' which naturally impressed on the hearer a vivid idea of the poetical talents of the sheriff, and Laidlaw felt towards him as an old friend. This was increased by Scott's partiality for dogs. He was struck with a very beautiful and powerful greyhound which followed Laidlaw, and he begged to have a brace of pups from the same dog, saying he had now become a forester, as sheriff of Ettrick, and must have dogs of the true mountain breed. 'This request,' said the other, 'I took no little pains to fulfil. I kept the puppies till they were nearly a year old. My youngest brother, then a boy, took great delight in training them; and the way was this: he took a long pole having a string and a piece of meat fastened to it, and made the dogs run in a circular or oval course. Their eagerness to get the meat gave them, by much practice, great strength in the loins, and singular expertness in turning, besides singular alertness in *mouth*ing, for which they were afterwards famous. Scott hunted with them for two years over the mountains of Tweedside and Yarrow, and never dreamt that a hare could escape them. He mentions them in the introduction to the second canto of *Marmion*—

Remember'st thou my greyhounds true?
O'erholt or hill there never flew,
From slip or loush there never sprang
More fleet of foot or sure of fang.

Before the friends parted, Scott took a note of Hogg's address, and from that time never ceased to take a warm interest in his fortunes. He corresponded with him, and becoming curious to see the poetical shepherd, made another visit to Blackhouse, for the purpose of getting Laidlaw along with him as guide to Ettrick. The visit was highly agreeable. The sheriff's *bonhomie* and lively conversation had deeply interested his companion, and he rode by his side in a sort of ecstasy as they journeyed again by St Mary's Loch and the green hills of Dryhope, which rise beyond the winding-sheet of smooth water. It was a fine summer morning, and the impressions of the day and the scene have been recorded in imperishable verse.* Dryhope Tower, so intimately associated with the memory of Mary Scott, the 'Flower of Yarrow,' made the travellers stop for a brief space; and *Dhu Linn* (where Marjory, the wife of Percy de Cockburn, sat while men were hanging her husband), with Chapelhope and other scenes and ruins famous in Border tradition, deeply interested Scott. At the west end of the Loch of the Lowes, the surrounding mountains close in in the face of the traveller, apparently preventing all farther egress. At this spot, as Laidlaw was trying to find a safe place where they might cross the marsh through which the infant Yarrow finds its way to the loch, Scott's servant, an English boy, rode up, and, touching his hat, respectfully inquired with much interest 'where the people got their necessities?' This unromantic question, and the *notet* of the lad's manner, was a source of great amusement to the sheriff. The day's journey was a favourite theme with Laidlaw. First, after passing the spots we have described, the horsemen crossed the ridge

* *Marmion*—Introduction to Canto II.

of hills that separate the Yarrow from her sister stream. These hills are high and green, but the more lofty parts of the ridge are soft and boggy, and they had often to pick their way and proceed in single file. Then they followed a foot-track on the side of a long *cleugh* or *hope*, and at last descended towards the Ettrick, where they had in view the level green valley, walled in by high hills of dark green, with here and there gray crags, the church and the old place of Ettrick Hall in ruins, embosomed in trees. Scott was somewhat chafed by having left in his bedroom that morning his watch—a valuable gold repeater, presented to him on the occasion of his marriage—and to Laidlaw's ejaculations of delight he sometimes replied quickly—'A savage enough place—a very savage place.' His good humour, however, was restored by the novelty of the scenes and the fine clear day, and he broke out with snatches of song, and told endless anecdotes, either new, or better told than ever they were before. The travellers went to dine at Ramsey-cleugh, where they were sure of a cordial welcome and a good farmer's dinner; and Laidlaw sent off to Blackhouse for the sheriff's watch (which he received next morning), and to Ettrick house for Hogg, that he might come and spend the evening with them. The Shepherd (who then retained all his original simplicity of character) came to tea, and he brought with him a bundle of manuscripts, of size enough at least to show his industry—all of course ballads, and fragments of ballads. The penmanship was executed with more care than Hogg had ever bestowed on anything before. Scott was surprised and pleased with Hogg's appearance, and with the hearty familiarity with which *Jamie*, as he was called, was received by Laidlaw and the Messrs Bryden of Ramsey-cleugh. Hogg was no less gratified. 'The sheriff of a county in those days,' said Laidlaw, 'was regarded by the class to whom Hogg belonged with much of the fear and respect that their *forbears* had looked up to the ancient hereditary sheriffs, who had the power of pit and gallows in their hands; and here Jamie found himself all at once not only the chief object of the sheriff's notice and flattering attention, but actually seated at the same table with him.' Hogg's genius was sufficient passport to the best society. His appearance was also prepossessing. His clear ruddy cheek and sparkling eye spoke of health and vivacity, and he was light and agile in his figure. When a youth, he had a remarkably fine head of long curling brown hair, which he wore coiled up under his bonnet; and on Sundays, when he entered the church and let down his locks, the *lasses* (on whom Jamie always turned an expressive *espègle* glance) looked towards him with envy and admiration. He doubtless thought of himself as the Gaelic bard did of Allan of Muidart—

And when to old Kilpedhar's church
Came troops of damsels gay,
Say, came they there for Allan's fame,
Or came they there to pray?

Mr Laidlaw thus speaks of the evening at Ramsey-cleugh:—'It required very little of that tact or address in social intercourse for which Mr Scott was afterwards so much distinguished, to put himself and those around him entirely at their ease. In truth, I never afterwards saw him at any time apparently enjoy company so much, or exert himself so greatly—or probably there was no effort at all—in rendering himself actually fascinating; nor did I ever again spend such a night of merriment. The qualities of Hogg came out every instant, and his unaffected simplicity and fearless frankness both surprised and charmed the sheriff. They were both very good mimics and story-tellers born and bred; and when Scott took to employ his dramatic talent, he soon found he had us all in his power; for every one of us possessed a quick sense of the ludicrous, and perhaps of humour of all kinds. I well recollect how the tears ran down the cheeks of my cousin George Bryden; and although his brother was more quiet, it was easy to see that he, too, was delighted. Hogg and I

were unbounded laughers when the occasion was good. The best proof of Jamie's enjoyment was, that he never sung a song that blessed night, and it was between two and three o'clock before we parted.'

Next morning Scott and Laidlaw went, according to promise, to visit Hogg. The appearance of the low thatched cottage was poor enough, but the situation is fine, and the opposite mountains, from the grand simplicity of their character, may almost be termed sublime. The Shepherd and his aged mother—'Old Margaret Laidlaw'—for she generally went by her maiden name—gave the visitors a hearty welcome. James had sent for a bottle of wine, of which each had to take a glass; and as the exhilarating effects of the previous night had not quite departed, he insisted that they should help him in drinking every drop in the bottle. Had it been a few years earlier in Scott's life, and before he was sheriff of the county, the request would probably have been complied with; but on this occasion the bottle was set aside. The scene was curious and interesting. 'Hogg may be a great poet,' said Scott, 'and, like Allan Ramsay, come to be the founder of a sort of family.' Hogg's familiarity of address, mingled with fits of deference and respect towards the sheriff, was curiously characteristic. Many years after this, we recollect a gentleman asking Laidlaw about an amusing anecdote told of the Shepherd. Hogg had sagacity enough to detect the authorship of the Waverley novels long before the secret was divulged, and had the volumes as they appeared bound and lettered on the back 'SCOTT'S NOVELS.' His friend discovered this one day when visiting Hogg at Altrive, and in a dry humorous tone of voice remarked, 'Jamie, your bookbinder must be a stupid fellow to spell *Scott* with two *s's*.' Hogg is said to have rejoined, 'Ah, Watty, I am ow'er auld a cat to draw that strae before.' Laidlaw laughed immoderately at the story, but observed, 'Jamie never came lower down than *Walter*.' 'How do you account for it, Mr Scott,' said Laidlaw on one occasion, 'that Hogg and Allan Cunningham have such awful trash in the midst of very fine and splendid passages?' 'I cannot tell you, Willy,' said Scott with a laugh, 'unless it be that, like the laird of Rigg's breakfast, it comes up a' together.'

From Hogg's cottage the party proceeded up Rankleburn to see Buccleuch, and inspect the old chapel and mill. They found nothing at the kirk of Buccleuch, and saw only the foundations of the chapel. Scott, however, was in high spirits, and being a member of the Edinburgh Light Cavalry, and Laidlaw one of the Selkirkshire Yeomanry, they sometimes set off at a gallop—the sheriff leading as in a mimic charge, and shouting, 'Slaughtan! mienen kinder slaughtan!' Hogg trotted up behind, marvelling at the versatile powers of the 'wonderful *shirra*.' They all dined together with a 'lady of the glen,' Mrs Bryden, Crosalee, and next morning Scott returned to Clovenford Inn, where he resided till he took a lease of the house of Ashiestiel.

These are homely details in the life of a great poet and genius, yet it was amidst these and similar scenes that Scott inhaled inspiration, and nursed those powers which afterwards astonished the world. The healthy vigour of his mind, and his clear understanding, grew up under such training, and his imagination was thence quickened and moulded. Byron studied amidst the classic scenes of Greece and Italy—Southey and Moore in their libraries, intent on varied knowledge. All the 'shadowy tribes of mind' were known to the metaphysical Coleridge. Wordsworth wandered among the lakes and mountains of Westmoreland, brooding over his poetical and philosophical theories, from which his better genius, in the hour of composition, often extricated him. Scott was in all things the simple unaffected worshipper of nature and of Scotland. His chivalrous romances sprung from his national predilections; for the warlike deeds of the Border chiefs first fired his fancy, and directed his researches. In these mountain excursions he imbibed that love and veneration of past times which coloured most of his compositions; and human sympathies and

solemn reflections were forced upon him by his intercourse with the natives of the hills, and the simple and lonely majesty of the scenes that he visited. These early impressions were never forgotten. Nor could there have been a better nursery for a romantic and national poet. Scholastic and critical studies would have polished his taste and refined his verse, but we might have wanted the strong picturesque vigour—the simple direct energy of the old ballad style—the truth, nature, and observation of a stirring life—all that characterises and endears old Scotland. Scott's destiny was on the whole pre-eminently happy; and when we think of the fate of other great authors—of Spenser composing amidst the savage turbulence of Ireland—of Shakespeare following a profession which he disliked—of Milton blind, and in danger—Dante in exile—and Tasso and Cervantes in prison—we feel how immeasurably superior was the lot of this noble free-hearted Scotoman, whose genius was the proudest inheritance of his country. 'Think no man happy till he dies,' said the sage. Scott's star became dim, but there was only a short period of darkness, and he never 'bated one jot of heart or hope,' nor lost the friendly and soothing attentions of those he loved. The world's respect and admiration he always possessed.

We need not follow in further detail the various wanderings of the sheriff and his friend. They were often renewed in the course of two or three summers and autumns. One excursion was made to the wild scenery at the head of Moffat water, where there is a striking waterfall and a fine lake, Loch Skene. Scott's personal strength and agility surprised most of his associates in these country rambles. Laidlaw thus writes of the expedition to Moffat dale:—

'We proceeded with difficulty up the rocky chasm to reach the foot of the waterfall. The passage which the stream has worn by cutting the opposing rocks of greywacke, is rough and dangerous. My brother George and I, both in the prime of youth, and constantly in the habit of climbing, had difficulty in forcing our way, and we felt for Scott's lameness. This, however, was unnecessary. He said he could not perhaps climb so fast as we did, but he advised us to go on, and leave him. This we did, but halted on a projecting point before we descended to the foot of the fall, and looking back, we were struck at seeing the motions of the sheriff's dog *Camp*. The dog was attending anxiously on his master; and when the latter came to a difficult part of the rock, *Camp* would jump down, look up to his master's face, then spring up, lick his master's hand and cheek, jump down again, and look upwards, as if to show him the way, and encourage him. We were greatly interested with the scene. Mr. Scott seemed to depend much on his hands and the great strength of his powerful arms; and he soon fought his way over all obstacles, and joined us at the foot of the Greymare's Tail, the name of the cataract.'

This excursion, like most of the others, Scott described in his introduction to *Marmion*. He was apt, on a journey among the hills, especially if the district was new to him, to fall at times into fits of silence, revolving in his mind, and perhaps throwing into language, the ideas that were suggested at the moment by the landscape; and hence those who had often been his companions knew the origin of many of the beautiful passages in his future works. Of this Laidlaw used to relate one instance. About a mile down Douglas-burn, a small brook falls into it from the Whitehope hills; and at the junction of the streams, at the foot of a bank celebrated in traditional story, stood the withered remains of what had been a very large old hawthorn tree, that had often engaged the attention of the young men at Blackhouse. Laidlaw on one occasion pointed out to the sheriff its beautiful site and venerable appearance, and asked him if he did not think it might be centuries old, and once a leading object in the landscape. As the district had been famous for game and wild animals, he said there could be little doubt that the red deer had

often lain under the shade of the tree, before they ascended to feed on the open hill-tops in the evening. Scott looked on the tree and the green hills, but said nothing. The enthusiastic guide repeated his admiration, and added, that Whitehope-tree was famous for miles around; but still Scott was silent. The subject was then dropped; 'but some years afterwards,' said Laidlaw, 'when the sheriff read to me his manuscript of *Marmion*, I found that Whitehope-tree was not forgotten, and that he had felt all the associations it was calculated to excite.' The description of the thorn is at the commencement of the second canto of *Marmion*, and is eminently beautiful.

We may here notice another poetical scene, the 'Bush aboon Traquair,' celebrated in the well-known popular song by Crawford. Burns says that when he saw the old 'bush' in 1787, it was composed of eight or nine ragged birches, and that the Earl of Traquair had planted a clump of trees near the place, which he called 'The New Bush.' Laidlaw maintained that the new bush was in reality the old bush of the song. One of the sons of Murray of Philliphaugh used to come over often on foot, and meet one of the ladies of Traquair at the *Cless*, a green hollow at the foot of the hill that overhangs Traquair house. This was the scene of the song. The straggling birches that Burns saw are half a mile up the water, the remains of a wooded bog—out of sight of Traquair house, to be sure, but far out of the way between Hangingshaw, on the Yarrow, and Traquair.

One morning in autumn 1804 was vividly impressed on the recollection of Laidlaw; for Scott then recited to him nearly the whole of the *Lay of the Last Minstrel*, as they journeyed together in the sheriff's gig up Gala Water. The wild, irregular structure of the poem, the description of the old minstrel, the goblin machinery, the ballads interspersed throughout the tale, and the exquisite forest scenes (the *Paradise of Ettrick*), all entranced the listener. Now and then Scott would stop to tell an anecdote of the country they were passing through, and afterwards, in his deep serious voice, resume his recitation of the poem. Laidlaw had, the night before, gone to Lasswade, where the sheriff then resided, in a beautiful cottage on the banks of the Eak, and on the following morning, after breakfast, they went up the Gala, when Scott poured forth what truly seemed to be an unpremeditated lay. They returned about sunset, and found the sheriff's young and beautiful wife looking on at the few shearers engaged in cutting down their crop in a field adjoining the cottage. Mrs. Scott seemed to Laidlaw a 'lovely and interesting creature,' and the sheriff met her with undisguised tenderness and affection. These were indeed golden days.

GLIMPSES OF NEW ZEALAND.

It will be remembered that in 1839 a company was formed in London for acquiring land and establishing settlements in the islands of New Zealand. An expedition was accordingly despatched in the spring of that year to treat with the natives, to select a site for a colony, and to make preparations for the reception of the emigrants. This charge was confided to Colonel William Wakefield, who sailed from Plymouth in the *Tory* on the 12th of May, with every necessary equipment. Such a voyage seemed to offer much novelty and adventure, and a nephew, Mr. Edward Jerningham Wakefield, conceived an eager desire to be one of the party. Having obtained a passage from the patrons of the enterprise, this youth, then only nineteen years of age, set out with the intention of returning with some of the emigrant ships; but becoming interested in the progress of the infant colony, he was tempted to prolong his stay for four years. He now gives his personal

narrative in two goodly volumes,* carrying us over the establishment of Wellington, New Plymouth, Nelson, and other towns, by the New Zealand Land Company in the bays of Cook Strait; the establishment of Auckland and Russell on the northern shores by the government; and the massacre of Wairau, by which he lost his uncle, Captain Arthur Wakefield, who had gone out with the Nelson settlers in 1841. The company having met with considerable opposition from the missionaries previously located in New Zealand, and with little cordial support from the resident officials of the British government, Mr Wakefield, acquiring, as he states, 'the unavoidable spirit of a partisan,' speaks of these opposing parties in terms of the severest censure, which necessarily precludes us from noticing that portion of his work which relates to the progress of the company's scheme. Moving as he did, however, with the surveyors over a great portion of the islands, his narrative abounds with interesting descriptions of the country and its natives—the capabilities of the former, and the manners and customs of the latter. It is from these that we now select what seems more especially novel and amusing, referring the reader for information of another sort to the volumes themselves, and to articles which have already appeared in this journal.

After a quick and pleasant voyage, the *Tory* dropped into Ship Cove, on the southern side of the strait, on the 16th of August. The first glimpses of the country were eminently encouraging. 'This morning, at daylight, we had warped farther into the cove, and anchored in 11 fathoms, muddy bottom, within 800 yards of the shore, where we fastened a hawser to a tree; thus occupying probably the same spot as Captain Cook, in his numerous visits to this harbour. There were a good many natives on board already; but, eager to touch the land, I got into a small canoe with Nayti, who paddled me ashore. The hills, which rise to the height of 1000 or 1500 feet on three sides of the cove, are covered from their tops to the water's edge with an undulating carpet of forest. How well Cook has described the harmony of the birds at this very spot! Every bough seemed to throng with feathered musicians, and the melodious chimes of the bell-bird were especially distinct. At the head of the cove is a small level space of land, formed by the alluvial deposit of three rills from the mountains, which here empty themselves into the bay. Landing here, I remained for some time absorbed in contemplating the luxurious vegetation of grass and shrubs, and the wild carrots and turnips which remain as relics of our great navigator. Rich historical recollections crowded on my mind as I tried to fix on the exact spot where Cook's forge and carpenter's shop had stood; and I was only roused from my reverie by the arrival of some more of the party, bent on the same object. We collected some shells, pebbles, and plants, and returned to breakfast on fresh potatoes and some of the fish which had been caught in abundance from the ship in the evening.'

Crossing the strait, they next entered Port Nicholson, which was subsequently chosen as the site of the company's first proceedings. This port or bay is completely land-locked, its fairway being not more than a mile in width, with a rocky reef on the north, and a high headland on the south. 'Captain Cook once anchored in the entrance of this magnificent harbour. Being anxious to rejoin the other ship in company with him, he was unable to examine it, but spoke highly of its promising appearance as a port. It was named Port Nicholson by the captain of a Sydney trading vessel some years ago, after his patron and friend, the harbour-master of Port Jackson, in New South Wales. As we advanced up the channel, which continues from two to three miles in width for four miles from a little inside the reef, we were boarded by two canoes, containing the two

principal chiefs of the tribe living on shore. One of mature years, named *Epani*, or "Greedy," advanced with much dignity of manner to greet our pilot as an old and respected friend, and was joined in this by his nephew, *Warepori*, or "Dark House," a fine commanding man of about thirty-five.

'The harbour expanded as we advanced, two deep bays stretching to the south-west from the innermost end of the entering channel. From their western extremity the land trends round to a valley lying at the north end of the harbour, about eight miles from the reef, while the hilly shores of the eastern side continue nearly straight to the mouth of the valley, thus leaving the upper part of the great basin four or five miles in width. In this upper part lie the two islands, behind the largest and most northerly of which we anchored at the distance of half a mile from the sandy beach at the valley's mouth. *Epani* eagerly inquired the motive of our visit, and expressed the most marked satisfaction on hearing that we wished to buy the place, and bring white people to it. *Warepori* also expressed his willingness to sell the land, and his desire of seeing white men come to live upon it.' Upon landing, they found the bay watered by several streams, and by one considerable river, called the Hutt or Heretaonga. The valley of this river preserved an average breadth of two miles to a considerable distance, bounded on either side by wooded hills from 800 to 400 feet in height. It was covered with high forest to within a mile and a half of the beach, though swamps full of native flax, and a belt of sand-hummocks, intervened. Colonel Wakefield ascended the river until some snags prevented the further progress of the canoe. He described the banks as of the richest soil, and covered with majestic timber, except where fertile but scanty gardens had been cleared and cultivated by the natives. As agent of the company, he accordingly made purchase of this district, which subsequently became the site of Wellington, the first location of the colony.

In the meantime, a surveying vessel, together with three or four emigrant ships, had left Britain, and, without inactive waiting their arrival, the *Tory* proceeded to examine and purchase other tracts along both shores of the strait. On Mr Wakefield's return to Port Nicholson, in January 1840, he found that four of the expected vessels had arrived, and that several hundreds of English and Scotch had already squatted on their adopted country. The following picture of this first location is exceedingly graphic and amusing:—'The sand-hummocks at the back of the long beach were dotted over with tents of all shapes and sizes, native-built huts in various stages of construction, and heaps of goods of various kinds, which lay about anywhere between high water-mark and the houses. Thus ploughs, hundreds of bricks, millstones, tent-poles, saucepans, crockery, iron, pot-hooks, and triangles, casks of all sizes, and bales of all sorts, were distributed about the sand-hummocks. The greatest good humour prevailed among the owners of these multifarious articles: the very novelty and excitement of their employment appeared to give them high spirits and courage. They pitched their tents and piled up their goods in rude order, while the natives, equally pleased and excited, sung *Maori* songs to them from the tops of the *ware* or huts where they sat tying the rafters and thatch together with flaxen bands. As I passed along, I was greeted by many an old acquaintance among these, who would jump down from his work with a shout of joy, and inquire anxiously whether "*Tiraweke*" had forgotten him. Thus I advanced through a running fire of kind greetings. At the back of the hut occupied by Coghlan [a grog-shop], whither a flag-staff and New Zealand flag invited the sailors, a rough and newly-made track struck off to the settlement on the river-bank, across a miry swamp. After about a quarter of a mile of this, I reached the junction of a small creek with the Hutt, and soon found myself at the beginning of a little village of tents and huts, among the low, scrubby cop-

* Adventure in New Zealand, from 1839 to 1844; with some account of the beginning of the British colonisation of the islands. By Edward Derwent Wakefield. 2 vols. Murray: London.

picewood which covered this part of the valley. A rough path had been cleared by the surveying men along the bank; and on either side of this the colonists had been allowed to squat on allotted portions until the survey of the town should be completed. * * I found the squatters on the Hutt no less busy and merry than their fellows on the beach. I met and welcomed two or three old friends whom I had not seen since I left England, and made several new acquaintances among the young capitalists, who were working with their retinues of labourers at putting their goods and chattels into some order and security. Three gentlemen, whom I was much pleased to see again in New Zealand, had formed themselves into a commercial firm, and had brought with them, among other things, the complete machinery of a steam-engine of twenty horse-power, adapted for sawing or flour mills. These were Mr Edward Betts Hopper of Dover, Mr Henry William Petre, and Mr Francis Alexander Molesworth. They were as busy as the rest, landing and arranging their goods. At high water, the ships' long-boats and private cargo-boats brought quantities of goods up to the owners' locations; the labourers and masters worked altogether at the casks and bales and other heavy things; the natives lent their willing aid, being very handy in the water, and then returned either to a job at hut-building, or to hawk about their pigs and potatoes, which they brought in canoes to this quick market.

'I walked some distance along the surveyor's line, and made the acquaintance of each of the new-comers as I did not already know. Each capitalist appeared to have a following of labourers from his own part of the country. Cornish miners and agricultural labourers had pitched their tents near Mr Molesworth; Kentish men dwelt near Mr George Duppe, a little higher up; and many of the Scotch emigrants were collected near a point between two reaches of the river where Mr Dudley Sinclair and Mr Barton were erecting their dwellings. At the latter place Mr Sinclair's English cow was browsing on the shrubs of her newly-adopted country.

'Small patches for gardens were already being cleared in various spots; ruddy, flaxen-haired children were playing about near the doors; and the whole thing made an impression of cheerfulness and contentment. Then the mildness of the climate, the good preparations made before leaving England, and the hearty good feeling existing among the colonists themselves, as well as between them and the natives, all tended to give the extensive bivouac the air of a pic-nic on a large scale, rather than a specimen of the first hardships of a colony. For, although all were often wet in the numerous boat-excursions and fording of streams and creeks, or occasional showers of rain, no one felt any injury to his health; master and man toiled with equal energy and good-will; and both enjoyed a good meal, often served up with all the comforts of civilised life. Thus, in a little, cramped, but weather-tight tent, you found a capitalist in shirt-sleeves taking a hasty meal of preserved meat and good vegetables (the latter grown from the seeds we had left with Smith), and drinking good beer or wine; and this from excellent glass and crockery, with plate, and clean table-cloths, and crust-stands, and all the paraphernalia. The labourer ate an equally comfortable dinner from the *pot-au-feu*, full of ration-meat and potatoes or cabbages, which had been prepared by his wife at the gipsy fire outside.

'Each English family had got a native or two particularly attached to them. They supplied their guests with potatoes and firewood, and with an occasional pig; shared in the toils and meals of the family, delighted at the novelty of every article unpacked, and were very quick at learning the use of new tools and inventions; chattered incessantly in Maori and broken English; devoted themselves, each to his own *pakeha* [or white man], with the greatest good-breeding, patience, and kind attention; and soon accustomed themselves to observe and imitate almost every new habit, with a striking desire of assimilating the amenities of their white brethren.'

Mr Wakefield, however, was not destined to be a settler, and so he left Port Nicholson for the purpose of surveying the country. On the 8th of April, we find him ascending the river Wanganui, under the guidance of a chief named E Kuru. 'A large convenient canoe was prepared; the place of honour was spread with mats for the chief and myself, and a strong crew manned the paddles. We proceeded about twenty miles up the river, which continued perfectly navigable for coasting-craft during the whole of that distance. The valley resembled that of the Waitotara on a large scale. The slopes up to the table-land were further removed, the groves of trees more extensive, and of larger timber, and the river averaged a hundred yards in width. About twelve miles above Putikiwaranui, however, the hills close in, and the river winds among scenery as majestic as that of the highlands of the Hudson. In some places, hills 800 or 1000 feet in height, clothed with every variety of forest-timber or fern, with beetling crags peeping out in places, slope down to the water's edge. Picturesque gardens and small settlements were perched on the banks, or half-way up the ascents; and many canoes, laden with food for the fishermen, glided gracefully down the river. As we met, kind greetings were addressed to the chief and his white man, and often a basket of cooked birds or other food was handed into the canoe. The weather, too, improved as we increased our distance from the sea; and at length no wind could be felt, and the fleecy acid drifting along overhead was the only sign that the gale continued. On arriving at a considerable village situate at the foot of a steep conical hill, and embowered in karaka trees, we pulled into a small tributary of the river, which gives its name, Te-kau-ara-pawa, to the pa. On the opposite bank of the creek, most of the inhabitants sat or lay basking in the sun on a raised stage, on which they had spread their mats. Masks were fired, and loud shouts of welcome resounded through the crowd. We were handed to the *pataka* or stage, and abundance of food was set before us. A large house was prepared for our accommodation for the night, and a chief named E Taus, related to E Kuru, killed the customary pig.'

At a subsequent period, Mr Wakefield ascended the Wanganui to its source, some seventy or eighty miles inland, in the high table-land from which arise the volcanic peaks of Tonga Riro. About twenty miles from the sea his route lay through romantic dells, over craggy cliffs, everywhere covered with wood, and across swamps choked with native flax, reeds, and jungle. Amid such scenery he wandered for several days, visiting several of the lakes, bathing in the hot springs, and vainly negotiating with the chief of the mountain district for permission to ascend the snow-capped peak of Tonga Riro, for which the natives have, it seems, a religious veneration. From what he states of the inland districts, there would appear to be no great facilities for agriculture, but abundance of room for pasture, hog-rearing, felling of wood, and cultivation of the phormium tenax or native flax. Of the growth and treatment of this plant, which has been much talked of in Britain, Mr Wakefield gives the following description. 'Each plant consisted of some forty or fifty leaves resembling those of our flag, from two to four inches in breadth, and reaching to the length of eight or nine feet. The leaves diverge from the root, and two or three flower-stems also shoot from the ground. These, however, had only begun to sprout. The leaves are all folded in two longitudinally, thus giving an inner and outer side to the leaf; but when it has attained its full growth, it sometimes opens out, although never so as to lie perfectly flat. The inner side has a natural gloss, while the outer side is dull. The natives seemed to prefer the innermost leaves, cutting them at about a foot from the ground with a sharp mussel-shell, of which they had brought a large stock from the sea-side. When a quantity of leaves had been collected, they proceeded to a division of employments. Some split the leaf longitudinally along the fold above-mentioned, and a second canoe

cut the dull or outer side of each half-leaf nearly through transversely about midway along its length. For this operation, which is rather delicate, and requires experience, a small cockle-shell was used. The art appeared to be to cut through all but the fibres, which border closely on the glossy portion. The half-leaves, thus prepared, were handed to a third workman. He, taking a bundle of them in his left hand at the transverse cut, and spreading them out like a fan, with the glossy side upwards, took a mussel-shell between the finger and thumb of his right hand to perform the next operation. This consisted in giving each half-leaf a longitudinal scrape from the transverse cut in the middle to each end. He held the leaves extended, by seizing the ends of each in succession with his big toe. Flax-scraping is always performed in a sitting posture, and one foot works quite as hard as either of the hands. The dexterity and quickness with which this whole operation was performed, drew from us repeated exclamations of delight, of which the performers seemed not a little proud. The result of the scrape is to make about five-sixths of the leaf, beginning from the dull side, drop off on to the ground in two pieces. The fibres which compose the glossy surface remain in the hand of the operator, of the full length of the leaf, and he puts them aside, and proceeds with another bunch. The splitters and transverse-cutters worked faster than the scrapers, and when they had operated on all that was gathered, they also took up their mussel-shell and scraped in their turn. The short pieces which I have described as dropping on to the ground, were treated as refuse, and allowed to dry or rot; the full-length fibre of the glossy side alone being preserved, to undergo further processes previous to manufacture into mats. The only use that I have ever seen made of the short refuse is for the outer portion of a rough mat, much resembling the thatch of a house. These leaves being woven in close rows, hanging downwards one over the other, into the interior texture of the mat, are perfectly impenetrable to rain. I have often braved with impunity the heaviest rain, sleeping under no other shelter.

Besides the native flax, Mr Wakefield directs attention to the fine forests of pine, black birch, and other timber, much of which seems admirably adapted for furniture purposes. The bark of many of the shrubs yields valuable dyes, and vegetable oils might be obtained in any abundance. As to the emigrant's chance of success with the ordinary vegetables of culture, we may judge from the following description of the climate:—Nothing could be more encouraging than the mild climate, and the unceasing bounty of nature, during the winter months. In May, which answers to the chill and foggy November of England, peas were in full bloom, small salads in every stage of growth, and almost all vegetation unchecked by the season. It was likened by Scotchmen to the second month of spring in their former land. The produce of garden vegetables, as a speculation, had been long abandoned, on account of the great ease with which every one could supply himself. No matter how bare, exposed, or rough the spot of ground, excellent vegetables could be produced by the most careless cultivation. The wild pasture on the hills had improved wonderfully under the constant browsing and tread of the cattle. Grass was replacing the fern all over the barren-looking hills that were clear of timber; and, in riding after cattle, many spots could hardly be recognised, owing to the great change that had taken place. And this rich pasture, and abundant supply of choice vegetables, from comparatively neglected gardens, continued during June, the centre winter month, which rather resembled a fine English October in its pleasantness of temperature. Even during the coldest month (September, answering to March in England), there was only a slight scurf of ice on the puddles over night. The temperature of the day rising to 60 degrees, soon dispelled every trace of frost; and towards the end of that month, spring had set in so mildly, that bats were flickering about in the twilight.

The above isolated snatches from Mr Wakefield's narrative certainly present the country, climate, and produce of New Zealand in a very favourable light; and, making allowance for a little partiality, we think the reader will agree with us, that, if wisely governed, few spots on the globe could present a finer field for an active and permanent settler.

AUTOGRAPHY.

THE first thing one does on receiving a letter, is to look whether we recognise the writing as that of a hand familiar to us. Oh, this is from A, or this is from B, is a familiar exclamation. At one glance we recognise A or B, as distinctly as if either stood before us face to face, though both perhaps may be thousands of miles off. Then, again, we collect the various signatures of our friends, or of celebrated persons whom we may never have seen, or known only by their works or fame, and paste them into our albums, and take a delight in looking on them, and comparing their resemblances or differences; in short, every observation of the kind leads us to the conclusion, that almost every person's handwriting differs from another, and that there is almost as complete an individuality in their mode of writing as in their countenances, their gait and gestures, or as in their minds.

There is scarcely a collector of such signatures who is not also a diviner of the character of the person as deduced from his handwriting. How often do we hear it observed, 'This is the writing of a prim, methodical, cold, reserved mortal'; or, 'That is the signature of a gay, volatile, and careless being.' How unequivocally can we mark out the writing of a lady from that of a gentleman. How readily that of a lawyer or merchant from that of a fashionable idler, or a 'man of wit or pleasure about town.' To many, it might appear a very absurd thing to say that there exists an intimate relation between the colour of a man's hair and his handwriting, and yet it is well known that the initiated in this matter pretend infallibly to distinguish the writing of a fair-haired person from that of a dark.

A very ingenious writer in the Northern Journal of Medicine has, in a late number of that work, afforded a physiological reason for the diversities of handwriting. This diversity he attributes to temperament; that is, a certain condition of the physical and mental constitution of the individual which constitutes his peculiar character. Of these temperaments there are at least half-a-dozen kinds, pretty distinct and well-marked, and perhaps half-a-dozen more of blended or mixed temperaments, where the shades are less distinguishable. The two extremes of natural temperament or complexion are well known to every one. We shall take, for instance, a man with light auburn hair, blue sparkling eyes, a ruddy complexion, ample chest, and muscular, well-rounded, and agile frame. Such a man will rarely fail to have a smile on his countenance, or a cheerful, perhaps witty saying on his lips. You will never find him moping in a solitary corner, but fitting about in the sunshine and bustle of society, joining in everything, and dwelling on nothing long. When such a man sits down to write, he makes short work of it: he snatches the first pen that comes in the way, never looks how it is pointed, dabs it into the ink, and then dashes on from side to side of the paper in a full, free, and slip-slop style, his ideas—or at all events his words—flowing faster than his agile fingers and leaping muscles can give them a form. Such a one's handwriting can never be mistaken; it is like his own motions, hop-step-and-jump. But, on the contrary, select a man with deep black hair, black eyes, brown or sallow complexion, and thin spare form, you will generally find him alone, and silently meditating, or sitting solitary amid crowds—of few words, of slow and deliberate action. You need scarcely be told how such a man sets about writing. After weighing well his subject in his mind, he sits down deliberately,

selects and mends his pen, adjusts his paper, and in close, stiff, and upright characters traces with a snail's pace his well-weighed and sententious composition. There can be no mistake in tracing the two handwritings which we have just described; and an adept in the science cannot fail in astonishing his audience with a sketch of the leading peculiarities of the mind and manners of each. But there are many intermediate shades of temperament, and many circumstances which go to modify the natural tendencies of the mode of writing, which fall to be considered. We shall, in the first place, give the following classified table of temperaments:—

1. Vigorous, light-haired, excitable temperament, what is commonly called the sanguine. The handwriting large, flowing, open, and irregular.

2. Dark-haired, excitable temperament, with brown florid complexion. The writing small, equal, and rather free and easy, with a firm and full stroke.

3. Light-haired, little excitable temperament; the complexion brown or sallow; the form spare. The writing less free and more methodical than No. 1, but less vigorous and less decided than No. 2.

4. Dark-haired, slowly excitable temperament; dark complexion, spare form, and melancholic habit. Small cramp upright writing, without ease or freedom, evidently slowly penned.

5. Feeble, light-haired, little excitable temperament; character timid and nervous. The writing small, unequal, and feebly traced, or not written with decision.

6. Mixed temperament, combining two or more of the above.

There are various combinations of these, which it would be unnecessary to particularise. Education and particular training of course make great changes on the natural tendency of the handwriting. Thus men of business acquire a mechanical style of writing, which obliterates all natural characteristics, unless in instances where the character is so strongly individual as not to be modified into the general mass. The female hand is also peculiar. Generally, it is more feeble and less individual than that of the male. In the present day, all females seem to be taught after one model. In a great proportion, the handwriting is moulded on this particular model: those only who have strong and decided character retain a decided handwriting. We often find that the style of handwriting is hereditary: sons frequently write very like their fathers; and this they do independent of all studied imitation, because the temperament happens to be hereditary also. A delicate state of health, especially if it has occurred in boyhood, has a considerable effect in modifying the natural form of the handwriting; thus sometimes connecting the free and flowing hand of the sanguine temperament into a more staid and methodical one.

A deficiency of early culture must also have a considerable influence on the form of writing. The forms, too, have varied in different historical eras. Before the introduction of printing, more pains seem to have been bestowed on penmanship. Ancient manuscripts are often found written in a beautiful, upright, and well-formed character, more in the style of print than the modern careless and flowing lines. This is easily to be accounted for: almost all that is worth preserving is now committed to that mighty engine of intelligence, both to present and future ages, the press, and therefore less care is bestowed on the original manuscript. The compositor and the pressman have now taken the place of the ancient scribe and copyist.

But even the individual handwriting varies from its character at various periods of life. In youth it is raw and unformed; in manhood it assumes its full character; and in old age it suffers somewhat of decay. Circumstances also affect its form not inconsiderably. No man is likely to dash off a note on his marriage-day in the same style that he would set about writing out his last will and testament. Our moments of joy are impressed upon the symbolical representations of them, just as are

our hours of bitterest sorrow. We often approach our familiars in a scrawl, as if imprinted by birds' claws instead of quill feathers, and which we would not deliberately despatch to those that we are accustomed to look up to with respect or awe.

Ease and freedom, and an indifference to please, are the prerogatives of rank and fashion; and hence it is probable that the most wretched scrawls have become fashionable among those who ever strive to ape the manners of the great. There are also, no doubt, national peculiarities in handwriting as well as individual. The Frenchman will show a volatility and spirit in his writing very different from the sedate and thoughtful German. The Northern Russ or the Calmuk Tartar must have a different fist altogether from that of the soft and voluptuous native of Hindostan.

We throw out these few hints to collectors of autographs. Let them arrange and classify their specimens, and form of them a *catalogue raisonné*. Thus, in the end, may some philosopher amongst their number elevate the pursuit into a science, at least not inferior to the ancient one of palmistry, astrology, and divination, or to the modern ones of mesmerism, hypnotism, homœopathy, or hydropathy.

OCCASIONAL NOTES.

STREET TRADERS.

In all crowded cities, both in these countries and on the continent, a very active retail trade is carried on in the open air. The traders being too poor to pay house-rent, their shops are portable, consisting of temporary stalls, baskets, wheelbarrows, and sometimes their own pockets. These chapmen and dealers are worthy of consideration, because, though only one degree removed from mendicancy, their callings demand both industry and honesty, whilst those virtues are exercised amidst very strong temptations to idleness and dishonesty. Having no roof to cover them, they are exposed to all the hardships of bad weather: having no legal right to carry on business in public thoroughfares, they are kept under the vigilance of the police.

One of the effects of that minute division of labour which results from an increase of population, and in the value of time, is to cause articles to be bought and sold which our predecessors made or procured quite easily at home. Take as an example the article of matches, which, though one of the earliest objects of itinerant merchandise, were not manufactured for sale till a comparatively recent period, for they were made by the persons requiring them, or by their servants. It is within our own recollection, that in an English country house one of the errands of the servant, when he went to the neighbouring town, was 'a stick of brimstone for matches,' which were invariably manufactured at home. The necessity for this household operation was soon superseded by visits of hawkers, who set up a regular manufacture and trade in the article. Perambulating match-sellers took their rise from the vagrant act which forbade begging, and the merchandise was exhibited as a sort of screen to their real employment, which was that of obtaining alms.

No branch of commerce, be it ever so unimportant, ever remains long stationary in this country, and the match-trade has made perhaps more rapid strides during the last half century than any other. The pseudo-beggars having once taken the trouble of domestic match-making off the hands of the public, it never again was willing to incur it, and ever after, the making and selling of these indispensable articles rose to the dignity of a regular employment. Small pieces of wood, each with a sharpened end, dipped in brimstone, were carried from door to door, or presented to passengers at the corner of every street. A foreigner, judging twenty years ago from the quantity displayed for sale in every part of the town and country, would naturally wonder what the English could want with

such forests of matches. But closer inquiry would have convinced him that they were in many instances used as a fence to the vagrant act—as a safeguard against the stocks, and a blind to the parish constable; for, while extolling their excellence and cheapness, the vender never failed to throw in a plea of pinching poverty, shared by a wife and a large family. Far, therefore, from inferring an extensive use of the objects offered for sale, it would be discovered that a mendicant made a good living out of the mere exhibition of his stock in trade, which was not perhaps diminished or added to for weeks together. Still, a vast number of these tinder-box appliances were sold, though the demand never exceeded the supply. Of this there was not the remotest danger, for the retail trade was overwhelmingly overstocked; and though there have been instances known of match-sellers retiring upon fortunes, yet in nine cases out of ten, their capital accumulated from eleemosynary gifts from the benevolent, and not from fair trading with consumers. The match-sellers of the brimstone school were jocularly denominated 'timber-merchants.'

About the year 1826, however, chemistry created a complete revolution in this extensive trade. A new description of match was invented, which, from the ease and certainty with which it ignited, completely superseded the former ones that had been in use for so many centuries. Much suspicion was at first created concerning them, on account of the manner in which it was understood they were prepared. Fulminating powder, phosphorus, and other diabolical ingredients, were reported to be contained in them; hence they got the name of 'Lucifers.' Like all infant manufactures, they were at first sold at a high price (6d. a-box) by chemists; afterwards, the demand for them increased as improvements were made in their composition, and they got into the hands of grocers and oilmen, when further reductions took place. A London grocer, more deeply read in poetical literature than his brethren, exhibited, by way of a shop-ticket, the quotation from Milton—

'O Lucifer! how hast thou fallen!'

and to which was added the deep bathos—'Matches only twopence a-box!' From that price they soon dropped to that at which they are now sold, and consequently came within the scope of the original traders in matches—beggars and itinerant dealers. From a recent parliamentary commission, we learn that the consumption of this sort of matches is more than five *billions* a-year, and that one man in London, who makes the wooden boxes to contain them, paid a thousand a-year for timber for that purpose; thus really deserving the designation which had been applied to his predecessors in the trade in jest—that of an extensive 'timber-merchant.'

Besides the vast quantity of *Lucifers* manufactured in England, uncounted numbers of them are imported from the banks of the Rhine, and various other parts of Germany. The wood is floated down the river from the thick pine forests, and the small branches and waste wood made into matches at various villages on the banks, and sent over to America, and to all parts of Europe.

Another of the small trades which consumes a great quantity of wood, is that of toys, which are carried about by itinerant salesmen, not so much for the purpose of sale as of barter. A long stick, at the end of which is fastened, on a pivot, sails made of wood and paper, to imitate those of a windmill, seem to be in the greatest demand. The eagerness with which they are coveted by children is proved by the groups which are invariably seen near the distributor of these envied toys. Knowing that actual cash is seldom possessed by his little customers, he meets that unfortunate deficiency of an important element of trade by declaring he will take almost anything in exchange for his wares—phial bottles, old clothes, broken crystal, and other (to him) valuables which are within easier reach. By this means he realises a better profit than if he traded for 'ready money only,' as, on selling the produce of his traffic to old store

dealers, he gets more than it is possible his young patrons would have paid for them in hard cash, even if they had it. A well-remembered toy-hawker realised a good fortune on this plan in another sort of toy: he was known all over England, and announced his presence by the couplet—

'If I had as much money as I could tell,
I never would cry young lads to sell.'

He kept his word, and left off business when he had as much money in copper coin as he could conveniently count at a long sitting.

Perhaps the most ancient of itinerant trades was that in quack nostrums; and it is within the present century that his 'occupation' was entirely 'gone.' The quack and his merry-Andrew have now quite disappeared from the stage of existence: the only successors who remain are the vendors of corn salve and cough drops, which, if not of actually curative, are mostly of a harmless character. The sellers of these articles are generally found at the corners of busy streets and markets, making eloquent orations in praise of their nostrums. They show themselves as proficient in the art of puffing as their predecessors the ancient mountebanks, though they seldom meet with such extensive success.

Not the least interesting of the small traders are the Italian image-boys. Vending, as they do, plaster casts from some of the most celebrated and beautiful sculptural works of ancient as well as modern art, they act as the pioneers of artistic taste amongst the humbler orders. The likenesses of celebrated men they exhibit and sell at a low price, are in many instances casts from marbles chiselled by artists of the highest eminence.

Itinerant dealers in eatables, particularly of vegetables, are of a less interesting, though perhaps of a more useful character. They are called indiscriminately 'costermongers,' otherwise, according to Dr Nares, traffickers in 'costards,' a species of apple of so common a sort, that it gave the name at an early period to hawkers of apples in general, and afterwards further extended as above. In poor neighbourhoods, this class of traders are of great use: they bring their wares to the doors of their customers, saving the valuable time of hard-working people, which would otherwise be wasted in going to and from shops and markets.

How much might be done to improve the popular tastes by the hawking of small tracts of a useful and entertaining class, has been already adverted to in these pages, and we are glad to know that our hints on this point have been in various places successfully adopted.

Small traders of the class we have described hold a precarious position as regards the law, by which they are tolerated rather than recognised. The truth is, law is very chary of extending protection to persons who do not pay taxes, yet is kind enough to wink at them, except when their existence is made too glaringly visible by an officious policeman bringing them before the 'bench' for some street obstruction or other nominal misdemeanour. Small traders are nevertheless a useful class of itinerants.

CHEAP TRIPS TO FOREIGN COUNTRIES.

When we pointed out, in a recent number, 'The Social Effects of Railways,' we adverted with pleasure to the opportunities they afforded to the public of making themselves acquainted with scenes and places they could never have beheld but for the well-applied powers of steam. These opportunities are rapidly increasing, and the large steamboat companies have begun to organise excursions to celebrated and interesting localities on the continent. The directors of the Dundee and London Shipping Company charter one of their commodious vessels for a pleasure trip to Hamburg; and to show the amount of accommodation they are able to afford intending tourists, they forward to any applicant a map of the places which it is practicable to visit, besides the port of entry. These, it appears, consist of the other Hans-Towns, Lübeck and Bremen; also Hanover, Brunswick, Magdeburg, Leipzig, Dresden, Ber-

lin, Potsdam, Stettin, Cologne, Dusseldorf, &c.—in other words, all the places of greatest note in Germany. The vessel remains twelve days, so as to allow sufficient time for the passengers to reach and inspect at least some of the above cities, to most of which railways are now in constant operation. This is not all: the same company having steamers which ply between London and the Rhine, passengers wishing to visit that noble river may leave the Hamburg boat to return without them, and wend their way to any part of Germany they please. So that they step on board one of the company's vessels some time during the summer, they can return by way of London by paying an extra fee of only one guinea. The cost of the trip is quite within the means of persons in the middle ranks, being £4, exclusive of provisions.

Another company have projected a less-frequented voyage—from Aberdeen to Norway, stopping a day or two at the Shetland Islands. The places to be visited abroad are Drontheim, Bergen, and Christiania the capital, at each of which places the vessel stops three or four days, so that ample time is allowed for exploring them and other places in the interior of the country. The whole tour is expected to occupy about three weeks, and its expense will not exceed that which a journey from Edinburgh to London entailed a few years ago for mere coach-hire—namely, £20; provisions being in this case included.

It is much to be wished that the projectors of these trips will be encouraged to repeat them. There is no surer plan for breaking down national prejudices, and for enlightening ignorance, than travel. It happens, unfortunately, that many thousands amongst the affluent in this empire stand very much in need of that sort of improvement which excursions abroad are of all means the best for effecting: we allude more particularly to those highly praiseworthy individuals who have raised fortunes from small beginnings, and whose minds have not always improved with their means. To the credit of our country be it said, that the majority of the rich mercantile class are such as we are now discussing. Convenient and cheap opportunities are now offered to them to see foreign nations—to glance at their institutions, manufactures, and exterior habits—and we trust those opportunities will not be entirely lost upon them.

THE COMFORTS OF THE CLASSES.

The high and romantic admiration we entertain for the ancient Greeks, receives a great check when we meet with the few passages occurring in history which enable us to judge of their personal and domestic comforts. The Spartan made indulgence of any sort a crime. The law obliged him to wear the coarsest garments, and to make no difference in their warmth in summer and winter, nor to remove them during rest at night. In building his habitation, he was allowed no other tool than the axe for the timbers, and the saw to form the doors. Everything was rough and simple, with the view of making the people hardy of frame and manly in manners. But even the other Greeks, who gave way to every luxury they could invent, had scarcely any of those domestic appliances which we look upon as common necessities. Though they had bedsteads, soft mattresses, skins, cushions, carpet-blankets, and coverlets, yet those refined ventilators—sheets—were denied them. When the model of womankind, the Greek beauty, arose from her couch to array herself in woollen, she had no stays or stockings to add to her comfort: to make her clothes air-tight, she had nothing but a buckle or a skewer, instead of pins. She painted her cheeks, lips, and eyebrows, to make herself, as she thought, outwardly fascinating; yet within, she knew not the cleanly luxury of linen. Neither had her lord a shirt, nor hose, nor buttons, nor handkerchief, nor pocket, nor lining to his cloak, nor gloves—items essential to the warmth and comfort of a modern gentleman.

The interior arrangements of a classic household were so different, that a Greek house would have been scarcely habitable by a modern. 'Their houses' were

Mr Bernan,* 'though elegant, were offensive; and if they had wax and tallow pith and rushlights, of candles they were always entirely ignorant. Abroad, therefore, the Greek, during his sharp winter, must often have suffered much privation; and within doors, he never could enjoy artificial heat or light without smoke and risk of suffocation, for his house had not a chimney; nor, in the cold weather, could he enjoy warmth with daylight in his elegant apartment, for he made no use of glazed windows.'

POPULAR NAMES.

LA PALICE—LA RAMER.

[From the French.]

THERE are certain periods in the history of most men of thought, when reason, exhausted by long and severe exercise, seems to abandon the reins, and leave to folly the control of the intellectual faculties. One instance may be found in Cowper's humorous ballad of John Gilpin; and another, which affords equally mirth-provoking amusement to our neighbours across the Channel, was the work of the grave and religious Bernard de la Monnoye, translator of the Gloss of St Theresa, who conceived the idea of personifying nonsensical truths in his *Complaint upon the Life and Death of La Palice*; careless of attaching popular ridicule to a name which should excite only recollections of heroic and military virtue.

Our little children, thanks to this strange production, know that the famous La Palice died in losing his life, and that he would not have had his equal had he been alone in the world. But, saving some other such revelations, La Monnoye has chosen to maintain a scrupulous silence upon the chief events which actually contributed to the celebrity of his hero. Doubtless it is satisfactory to know that he could never make up his mind to load his pistols when he had no powder; and that when he wrote verse he did not write prose; or that while drinking he never spoke a word. These are certainly notable details concerning the habits and character of this great man, which the poet was wise to notice; but it is also certain that La Palice had greater claims to admiration, which may be brought to light in illustrating some stanzas of the biographical ballad. We shall endeavour to fill up the gaps which occur at every step in La Monnoye's history. It is good to be merry, but it is better to be exact, especially when writing about an individual who, for three centuries, has occupied a high position among the heroes who have done most honour to France.

The song, it will be seen, is a burlesque, somewhat similar in character to that upon the valiant Malbrough. It begins thus:—

'Please you, gentlemen, to hear
The song of La Palice;
It surely will delight you all,
Provided that it please.'

Besides this proposition, so honestly and neatly enunciated, the historian would have done well to tell us that La Palice was named also Jacques II. of Chabannes. He was of noble race, for his grandfather, an earlier Jacques de Chabannes, after valiantly defending Castillon against Talbot, the English Achilles, died of his wounds at the siege of this city, which, two years afterwards (17th July 1453), cost the life of his illustrious enemy. He was of noble race this Jacques de Chabannes, and, we may add, of noble heart. Charles VIII. owed to him in part the conquest of Naples, and Louis XII. that of the duchy of Milan.

'La Palice but little wealth
To his renown could bring;
And when abundance was his lot,
He lacked no single thing.'

Abundance of glory, of honours, of treasures, of war on battle-fields; this was surely what the poet meant to say. He ought to have been rich indeed, when three sovereigns successively invested him with the titles of marshal of

France, governor of Bourbonnais, of Auvergne, of Forez and the Lyonnaise. He was still more rich in the esteem of his enemies, who in the battles aimed all their bullets at him; wishing, as they said, to strike down one of the bravest heads of the army. He was rich also in the love of his soldiers, whom he fed at his own expense, when the supplies failed through the carelessness or treachery of the state paymasters.

'He was versed in all the games
Played at the academy;
And never was unfortunate
When he won the victory.'

Those which he gained are faithfully chronicled in history. First stands Marignan, in 1515, that terrible struggle, in allusion to which old Marshal Trivulce said, all others were but child's play in comparison. It was a famous victory gained by Francis I. over the Swiss and the Duke of Milan, and has been ever since known as the Battle of the Giants; next Fontarabia, the key of Spain, which the same general, under the same monarch, carried at the point of the sword in 1521; then Bicocca, in Lombardy, where Lautrec lost the battle and his honour, and La Palice, being second in command, made incredible exertions to recover the fortune of the day; and last, Marseilles, which treason had given to the arms of Charles V., which went to sleep one night Spanish, and woke up French the next morning, because a great captain, Chabannes de la Palice, had scaled her walls, and effaced by dint of courage the shame with which the desertion of Bourbon had tarnished the name of French gentlemen.

'To do and dare in his career,
He readily inclined;
And when he stood before the king,
He was not, sure, behind.'

On the eve of the battle of Pavia he stood before Francis I., and, with the counsel of a brave man, addressed the monarch:—'You are eager to fight, sire; would it not be better to be certain of conquering? Our blood belongs to you, but you belong to France; and you owe to the kingdom a reckoning of your enterprises against the enemies of the state. God forbid that I should give such a lesson to the king my master, but it behoves him to take counsel when he goes to stake his crown in a single battle, which, if lost, cannot fail of being fatal. There, behind those walls, are Lannoy and Pescara, with the bravest of their troops; here, none but worn-out soldiers, few in number, and dying of fatigue. Behind those walls stands Antoine de Lève, a general of genius and resources, who has never been conquered. Were he beaten, the empire would lose but one man, but on our side we lose a king. The game is not equal, sire; sign the truce, and some day we shall find ourselves again before the place with forces enough to sustain our just rights.' La Palice was now an old man, and Francis, flattered by the opinions of his younger captains, declared for battle, and drew his sword, to give it up on the evening of the same day to the brave Lannoy, who received it on his knees from his royal prisoner.

'Fate dealt to him a cruel blow,
And stretched him on the ground;
And 'tis believed that since he died,
It was a mortal wound.

His death was sore and terrible,
Upon a stone his head;
He would have died more easily
Upon a feather bed.'

Chabannes made a sortie with a handful of brave fellows from the fort which he defended against the Spanish army, and saw all those who followed fall around him. No way of retreat remained open; and, covered with wounds, he could scarcely wield the sword with which he had opened the gates of Ravenna and Navarre. He sees a fragment of a wall, which may enable him to hold out for a time against the enemy, and plants himself against it, determined to die, as he had lived, gloriously. At each sweep of his sword an antagonist falls at his feet; they press closer upon him, and offer quarter; while a Spanish soldier climbs over the barrier of corpses piled

before him, aims a tremendous blow at his head, beneath which the brave La Palice fell senseless to the earth.

'Deplored and envied by his braves,
He shut his eyes to strife;
And we are told his day of death
Was the last of his life.'

Some chroniclers have written—

'Fifteen minutes before his death,
Ah, he was yet alive;'

a space of time which he worthily employed in closing a life of glorious activity. Often, says the historian, La Palice was dragged half dead to the tent of the enemy's general, who threatened him with the ignominious death of hanging, if he did not persuade the besieged to deliver up the fort. He requested to be carried to the foot of the ramparts; two soldiers took up the captive marshal on their shoulders, and bore him to the gate of the fortress which had so long resisted the skill and courage of the besiegers. When there, in a dying voice he gave orders to summon his lieutenant Cornon. 'Brave friend,' he said to him, 'do you know the condition of the citadel?' The lieutenant, deeply affected at seeing his general in so perilous a situation, could only answer by a slight inclination of the head. 'This is not the time for tears,' continued the great man; 'say, can you hold out till the arrival of the Duke of Nemours?'

'Yes, we will hold out, be it for a month!' he replied with a firm voice.

'Good,' rejoined the chief, and turning towards the Spanish commander, said, 'Do with me as you please. I commend my soul to God; my men will do their duty.'

The ancients, sometimes unjust towards their great men, invoked the terrible law of necessity for their banishment, but preserved their memory with religious respect. It was reserved for modern times to dishonour a great name by a ridiculous abuse of humour.

We must go far back in the annals of history to arrive at the date of the birth of the famous La Ramée, popularly known as the *First Grenadier of the World*. If we are to believe the chronicles of the barracks, and the historians of the bivouac, he stood sentinel when the world was very young, and, growing tired, deserted his post, and went through numerous adventures among the nations of antiquity; until, in the progress of time, he enlisted under the banners of the emperor Napoleon. If you ask old soldiers still in the service where this ancient of ancients may be met with, they will tell you that La Ramée, together with his pipe, are supported at the expense of the state in the Royal Hospital of Invalids: the one well blackened, as a pipe ought to be which has not gone out for 5834 years; the other decorated with 1100 chevrons, which give him a claim to the respect of his comrades, and to the double ration of wine. If you inquire at the invalids for the number of La Ramée's room, you will be told that he sleeps upon the field of Waterloo, among the brave with whom he found himself at the memorable battle. But let war come again—an event to be desired neither for our firesides nor our frontiers—and La Ramée will revive, to be again the wonder of raw conscripts, and to add some new chapters to his already voluminous history.

If ever there was a pleasant and jocund tradition, it is this; which, passing from mouth to mouth from time immemorial, and becoming enriched at every step it has made in the world's memory, by many additions as extravagant as improbable, has at last been adopted as the immortal epic of the guard-house. But it must be remembered that there was another La Ramée, celebrated in his own day, but little known in ours.

In 1510, a little boy, clothed in the coarse rustic dress of sackcloth, a woollen cap on his head, his features sharpened by hunger, and his eyes very wide open, if not from appetite, at least from all the wonderful things which he saw around him, entered Paris. He directed his steps towards the street *de la Paille*, where the scholars of the university were playing together. He was speedily surrounded by a host of waggish boys, who were never backward in intimidating greater and stronger than

he, and made to submit to a great number of mischievous questions, and a still greater number of painful blows. But when the first heat of mischief was over, the best-disposed among the young collegians gave him a portion of their bread, and made room for him on the straw with which the street was strewed. Refreshed and comfortably seated, Pierre La Ramée began the history of his life and journey with great simplicity and brevity. He was born at Cuth, in Vermandois, eight years before. When scarcely old enough to walk alone, he went from door to door begging his bread; and as the villagers could not support him in idleness, a long stick was put into his hand, with which he drove every day a flock of geese to a pond in the neighbourhood. The occupation became distasteful to him, and one day he left his intractable charge to look after themselves, threw his long stick into a thicket, and set off on the road to Paris. Begging on the way, as he had begged in the village, he arrived not richer, but wiser; for he fell into company with a learned monk, who taught him the names of all the letters of the alphabet, and the art of uniting them so as to form words. After his recital, Pierre La Ramée entered the service of some of the scholars, with the condition that they should continue his scarcely-commenced education.

During several months he went every night to sleep under one of the arches of the bridge de la cité: his days were passed in running errands for the students, and enduring the effects of their ill temper and vicious character. He, however, contrived to keep himself alive by the crusts of stale bread which fell to his lot; while the bribes of Latin, with which he was occasionally induced to undertake some errand more disagreeable than usual, furnished his mind, and rendered him more and more desirous of learning.

The vacations, however, arrived, the colleges were deserted, the servants of the university cleared the straw from the street, and Pierre La Ramée found himself without a master—deprived all at once of his hard-earned crusts and Latin lessons. To complete his misfortunes, the plague broke out in the city, and he returned in much affliction to Cuth.

Four years from that time, a youthful servant was employed at the college of Navarre, who, with broom in hand, worked all the day sweeping the various classrooms; and who at night, when all were asleep, lit his master's lamp, and read over by himself the lessons of which he occasionally caught a few words during the hours of study. He carefully preserved the sheets of waste paper met with in the exercise of his duties, and with great labour wrote notes upon the authors he read; these sheets fell by accident into the hands of one of the professors, who summoned the boy into his presence, and after strict questioning, bade him prepare himself to support his thesis, as the time had come for conferring upon him the degree of master of arts. In those days Aristotle reigned despotically over the schools of philosophy, and no one dared to attack a system which would have brought upon him the reproach of heterodoxy. But Pierre La Ramée dared; and from that moment commenced his glory and his persecutions.

We shall not follow the youth, become man, appearing before a tribunal appointed to judge his anti-Aristotelian doctrines; nor do more than allude to the famous school of which he was the founder, and to his books condemned to the flames. Crowds flocked to hear him in wondering admiration, while the church roused herself for a severe struggle with her new opponent; but the parliament interposed itself to shield the wise and learned teacher from the blows directed against him. Being expelled from Paris, the king gave him an asylum at Fontainebleau; while his enemies, profiting by his absence, pillaged his house and devastated his college. But at last, wearied with strife, they permitted his return, and crowds of young men again listened to his lectures. Once more he was monarch of the schools, and father of his scholars; the supreme master of eloquence, appeasing the fury of the populace or military turbulence by the charm of his words. In the night of the 24th August 1572, when assassins were scouring the city of Paris, in the name of

religion and the king, immolating all suspected of the odour of Protestantism, Charpentier, a doctor of the Sorbonne, profiting by the general excitement to gratify a personal hatred, roused the mob, and led them to the college of Presle, where for many years Pierre La Ramée, bestowing his science gratuitously on the poorest, reposed himself upon straw after the long fatigues of his professorship, as in the days of his youthful distress. Charpentier, after a long search through all the classes, without finding him who wished to dethrone Aristotle, and put truth and reason in the vacant place, in his thirst for vengeance descended to the cellars. There he sees an aged man, half dead with fear, who supplicates humbly for his life. 'Will you give me all your money?' demanded his persecutor. 'All,' was the reply. 'You shall teach no more,' continued the bigot. 'I will teach no more,' answered the philosopher in despair. Charpentier received his oath, and seizing upon the accumulated savings of a life of learning, called in his infuriated followers, who murdered their victim. Thus died Pierre La Ramée, or Ramus; for, according to the usage of the time, he had Latinised his name. And such was the actual person who is alluded to by the soldiers in their ridiculous legend. The change resembles that which has caused Virgil to be remembered as a sorcerer in Italy, and Michael Scott to be regarded as a wizard in Scotland. The causes which lead to such whimsical misrepresentations it were vain to inquire for.

AN HOUR BETWEEN HOLBORN AND SMITHFIELD.

PUBLIC attention is at present earnestly directed towards the health of towns, dwellings for the poor, their education, and the melioration of their moral and physical condition. New, handsome, and airy streets are now in the course of being opened in the metropolis, on sites hitherto encumbered with miserable dwellings, inhabited by the very dregs of society, and where moral and physical decadency had been in progress for many generations.

But a very natural question arises in one's breast on observing these clearings of the wilderness, as to what has become, or is to become, of the *aborigines*, if such a denomination be admissible?

There is but too much reason to believe that these 'rookeries'—a popular name for them in London—have only been transferred to other rank spots, previously over-crowded; and that the evils which, on seeing the uprooting process in action in some localities, one is inclined to think are on the eve of being remedied, are, on the contrary, hourly augmenting in consequence of a more condensed state of the contagious elements.

Reflections of this nature forced themselves irresistibly on my mind on the following occasion:—Having read in the papers that various strange discoveries had been made in the neighbourhood of Smithfield during the progress of the improvements in the way of opening new streets, I yielded to one of those sudden impulses which have carried me into a variety of curious scenes in divers portions of our habitable globe, and found myself one rainy day last autumn in a (to me) *Terra Incognita*, in the very centre of the capital of this great country—great in its commerce, its valour, its wealth, its possessions, its social ties; great in its influence in all parts of the world, mainly owing to the generally received opinion that its institutions and its moral and religious organisation are upon a scale highly superior to the general standard.

Passing down the wide space at the foot of Holborn Hill, opposite to Faringdon Street, bordered by rows of arched cellars for the houses in the course of erection, I arrived in front of a board separating the end of the new street from a lane running across and much below it, one of the miserable houses in the lane having been pulled down as far as the basement storey. Of a half-starved-looking man I purchased for a penny a little pamphlet of eight pages, printed in Seven Dials, professing to

contain 'full particulars of the extraordinary houses in West Street, Smithfield, with an account'—so said the last-dying-speech-looking title-page—'of the strange discovery of human bones, &c. that was found in the residence of Jonathan Wild, formerly called the Red Lion public-house, in West Street, Smithfield, the resort of Jack Sheppard and Jerry Abershaw,' &c. &c.

With this 'hand-book' for my guide, I passed through a wicket in the boarding, and descended into the lane. Opposite the house nearly pulled down—the notorious Red Lion public-house—were several uncouth-looking people; two policemen wearing their oilskin capes were walking up and down; one of them had a switch in his hand, with which he motioned to the people to keep moving. I asked him whether the little book was to be relied upon. He answered that the facts had been much exaggerated. After contemplating the ruin for a few minutes, I moved to the right, and was again skimming the contents of the hand-book, when the same policeman passed and said to me 'They are all lies you are reading there.' Upon this official authority I closed the book, adjusted my umbrella so as to keep the rain off—for so intent had I been upon the description of the 'extraordinary houses,' that the umbrella had got awry, and my left sleeve was soaked through—and regained the upper regions through the wicket. Seeing the lean pamphlet-vender still wandering about in the rain, I gently informed him of what the policeman had said respecting his hand-books.

'It's only to keep the crowd off, air; if you go to the back you'll know more about it.'

I immediately acted upon this opportune suggestion. It would be an infringement on literary property to enter into a description of the 'full particulars of the extraordinary houses' contained in the hand-book; suffice it to say, that from all I was able to see and learn, I believe its contents were correct.

My object is to state the 'great fact' that, up to that hour, the numerous alleys and courts, and the wretched tenements by which the Fleet-ditch was bordered, were inhabited by a population of the most revolting description; a shame and a scandal in the heart of a metropolis through whose capacious arteries—within a stone's throw of these sinks of infamy—is continually flowing the rich stream of commerce and luxury; and where floods of people sweep along without bestowing a thought on the veins, clogged with rank corruption, which branch off from those arteries.

I entered the labyrinth through Black-Boy Alley, and, proceeding down it for about a hundred yards, reached a sort of archway on the left. From the ground-floor window of a miserable one-storeyed old house at the side of it, a wretched woman—young, but bleary-eyed and bloated, and with meshes of hair stiffened with dirt bristling from her uncapped head—peered out, and with a revolting leer addressed me in terms exciting not only horror and disgust in my mind, but also compassion at seeing the almost hopeless state of degradation into which this unfortunate had fallen.

Passing under the archway, which was partially choked up with matters of the most offensive description, I emerged on an open space into which the back-windows of the house just mentioned looked, out of one of which leant another woman much older than the first. Her sallow, wrinkled, unwashed face was shaded by the broad, discoloured border of a calico cap: she scowled upon me, but did not speak. The space on which I stood appeared to have been formerly occupied by a tenement, or tenements; and in front of it, about six feet below, the sides being strengthened by old brick-work, but without any parapet, flowed the Fleet-ditch, as it is called—a turbid, fetid, deep brook, or stream, rushing towards the Thames at the rate of eight or nine miles an hour; the width might be about ten feet. On the left was the lower floor of a house built over the stream. The rafters and supports were wormeaten, and I understood that the flooring was inlaid with trap-doors, through which no doubt many victims had been

plunged into the rapid muddy stream below. Looking up towards the right, I saw a long line of gable ends of mean houses, many of them built of wood, and pierced with small windows, rising from the edge of the brook.

Whilst leaning over with straining eyes and offended nostrils to examine this singular scene, a knot of people had collected on the specs in the rear. On raising my head, and turning round to ascertain the cause of a strange medley of sounds which assailed my ears, I perceived a group of about twenty youths and lads, and three or four slatternly girls. They were shouting, and blaspheming, and leaping up wildly into the air. But though all were young, they had the faces of old and hardened beings; their mirth was like that of half-stupified Bacchanals; their voices harsh; their eyes staring boldly, and scanning every particle of my clothing, and watching all my movements; but those eyes were entirely bereft of the brightness and animation of uncorrupted youth. These wretched beings hovered and skipped about me, cursing and swearing, and now and then making remarks one to another in (to me) an unknown tongue: anon they eyed me askance, so that as there was no policeman, nor other protection in sight, or at hand, I began to think of the means of defence or retreat.

The rushing ominous stream was before me, gathering round me was a band of most suspicious beings, and the only issue was by the dark archway, bordered and beset as already described. Presently a lad sprang from the group, and with a scream as of triumph, rushed towards the stream, and leaped over it, landing safely within a few inches of its steep bank, on the other side. This feat elicited great shouting and dispersion among his reckless companions, most of whom ran to the edge of the black rivulet, and bending over it, looked up to the right, as though something new were to be seen in that direction. My curiosity overcame the desire to profit by the favourable opportunity of effecting my retreat; so I followed their example.

What a revolting scene met my gaze! Out of the little windows in the gable-ends of the tenements were thrust heads of awful-looking men and women, and girls and lads; the men with bare brawny arms resting on the mouldering window-sills, their begrimed shirt-sleeves rolled up above the elbows; the women either with broad-flounced night-caps almost concealing their features, or with their hair sticking out from their Medusa-like heads; as for the juveniles, they had the appearance of imps!

The cause of the tumultuous assemblage on the brink of the Fleet-ditch, of the shouts, and of the apparition of so many uncouth busts from the narrow windows, was the floundering of half-a-dozen boys in the rushing water. How they had found their way thither I could not discover; but *there* they were, disporting in the nauseous flood with as much glee as though they had been bathing in the limpid Serpentine.

I gladly took advantage of the excitement of the young reprobates about me to make good my retreat unperceived. Threading the intricate windings of the surrounding lanes and alleys, stuffed with human beings of the most revolting appearance, evidently imbedded in ignorance and vice, I came to a lofty and extensive building, to which, however, there was no perceptible entrance at that part: skirting the walls, I found it to be a large manufactory. The contrast was striking. Here, said I to myself, is an establishment belonging no doubt to wealthy people. Hard by is a capacious thoroughfare, almost in a direct line from the great docks, filled with the richest merchandise from every part of the globe, to the mansions of the great, the powerful, of this magnificent metropolis. This thoroughfare is bordered by the establishments and the residences of rich and respectable tradesmen; of that estimable middle-class which forms so essential a portion of the solid basis of English society. And yet, on the very thresholds of these persons, there is a mass of population savage as any that dwell in *Africa* or furthest *Ind*—more than that, even

pests to society, active and reckless marauders, vicious to the last degree themselves, and, by their pernicious example, the ruin of all whose unhappy fate brings them under their withering influence!

It might be vain to ask, in such a case, if Christian philanthropy sanctions the fortunate and the educated in thus leaving so many fellow-creatures and neighbours in a condition so wretched in all respects. But let me limit my interrogation to something more practical, and inquire if it be good policy. These people are for the most part idle, as far as lawful occupation is concerned. They must all live, and of course their living comes out of the substance of the rest of the community. Might there not be a saving in laying out something to bring them within the pale of a decent life? They form foci of disease: would it not tend to the public health if some effort were made to place them in purer circumstances? Surely, without incurring any suspicion of extravagant views, I am justified in saying that something is wrong here, and that its redress is loudly called for. With these remarks, as perhaps a needless addition to my portraiture of what I saw, I leave the subject.

THE STUDY OF NATURE.

It is impossible that any person, however thoughtless and unaccustomed to observe the works of creation, can look around him, even during a morning's ramble through the fields, without being struck with the number of living beings that offer themselves to his notice, presenting infinite diversity of form, and obviously adapted, by their construction and habits, to occupy various and widely different situations. The careless lounge, indeed, untaught to mark the less obtrusive and minute features of the landscape, sees, perhaps, the cattle grazing in the field; watches the swallows as they glance along, or listens with undefined emotions of pleasure to the vocal choir of unseen feathered songsters; and, content with these symptoms of life around him, passes unheeding onwards. Not so the curious and enlightened wanderer, inquisitive to understand all that he finds around him: his prying eye and mind intelligent not only can appreciate the grosser beauties of the scene, and gather full enjoyment from the survey, but perceive objects of wonder multiply at every step he takes: the grass, the trees, the flowers, the earth, the air, swarm with innumerable kinds of active living creatures: every stone upturned reveals some insect wonder; nay, the stagnant ditch he knows to be a world wherein incalculable myriads pass their lives, and every drop to swarm with animated atoms, able to proclaim the Omnipotent Designer loudly as the stars themselves. Is it upon the sea-shore that the student of nature walks? Each rippling wave lays at his feet some tribute from the deep, and tells of wonders indescribable—brings corallines and painted shells, and thousand grotesque beings, samples left to show that in the sea, through all its spacious realms, life still is found—that creatures there exist more numerous than on the earth itself, all perfect in their construction, and, although so diversified in shape and attributes, alike subservient to the general welfare. And yet how few, even at the present day, turn their attention to this wondrous scene, or strive at all to understand the animal creation—to investigate the structure and contrivance that adapt each species to perform certain important duties—to perceive the uses and relations of each group—to contemplate the habits and the instincts that direct the different tribes—and, lastly, to trace out the means whereby the mighty whole, formed of such diverse parts, is all along preserved in perfect harmony!—*Ryder Jones.*

WELSH SURNAMES.

In Sweden, hereditary surnames are said to have been unknown before the commencement of the fourteenth century. At a much later period, no surnames were used in Wales, beyond ap, or son, as David-ap-Howell, Evan-ap-Rhys, Griffith-ap-Roger, John-ap-Richard, now very naturally corrupted into Powell, Price, Prodyer, and Pritchard. To a like origin may be referred a considerable number of the surnames beginning with P and B now in use in England; amongst which may be mentioned Preece, Price, Punphrey, Farry, Probert, Probyn, Pugh, Penny; Bevan, Bithal, Barry, Benyon, and Bowers. It was not unusual, a

century or two back, to hear of such combinations as Evan-ap-Griffith-ap-David-ap-Jenkin, and so on to the seventh or eighth generation, so that an individual often carried his pedigree in his name. The church of Llangollen in Wales is said to be dedicated to St Collen-ap-Gwynnawg-ap-Clyndawag-ap-Cowrda-ap-Caradoc-Freichfras-ap-Llyn-Merim-ap-Einion-Yirth-ap-Cunedda-Wledig, a name that casts that of the Dutchman Inkerankododosponekinkadrachdern into the shade. To burlesque this ridiculous species of nomenclature, some wag described cheese as being

Adam's own cousin-german by its birth,
Ap-Curds-ap-Milk-ap-Grass-ap-Earth.

The following anecdote was related to me by a native of Wales:—An Englishman, riding one dark night among the mountains, heard a cry of distress, proceeding apparently from a man who had fallen into a ravine near the highway, and, on listening more attentively, heard the words, "Help, master, help!" in a voice truly Cambrian. "Help what? Who are you?" inquired the traveller. "Jenkin-ap-Griffith-ap-Robin-ap-William-ap-Rees-ap-Evan," was the response. "Lazy fellows that ye be," rejoined the Englishman, setting spurs to his horse, "to lie rolling in that hole, half-a-dozen of ye; why, in the name of common sense, don't ye help one another out?" The frequency of such names as Davies, Harris, Jones, and Evans, has often been remarked, and is to be accounted for by the use of the father's name in the genitive case, and the word son being understood; thus David's son became Davis, Harry's son Harris, John's son Jones, and Evan's son Evans. It is a well-attested fact, that about forty years since the Monmouth and Brecon militia contained no less than thirty-six John Joneses. Even the gentry of Wales bore no hereditary surnames until the time of Henry VIII. That monarch, who paid great attention to heraldic matters, strongly recommended the heads of Welsh families to conform to the usage long before adopted by the English, as more consistent with their rank and dignity. Some families accordingly made their existing surnames stationary, while a few adopted the surnames of English families, with whom they were allied, as the ancestors of Oliver Cromwell, who thus exchanged Williams for Cromwell, which thenceforward they uniformly used.—*Family Nomenclature.*

FROGS IN STONES.

We have several apparently well-authenticated instances on record of frogs and toads having been found enclosed in masses of rock, to the interior of which there was no perceptible means of ingress. It has been the fashion, however, with naturalists to dismiss all such cases on the assumption that there must have been some cleft or opening by which the animal was admitted while in embryo, or while in a very young state; no one, so far as we are aware, believing that the sperm or young animal may have been enclosed when the rock was in the process of formation at the bottom of shallow waters. Whatever may be the true theory regarding animals so enclosed, their history is certainly one of the highest interest; and without attempting to solve the problem, we present our readers with an instance taken from the Mining Journal of January 18, 1845:—A few days since, as a miner, named W. Ellis, was working in the Pen-y-darvan Mine Works, at forty-five feet depth, he struck his mandril into a piece of shale, and to the surprise of the workmen, a frog leaped out of the cleft. When first observed, it appeared very weak, and, though of large size, could crawl only with difficulty. On closer examination, several peculiarities were observed; its eyes were full-sized, though it could not see, and does not now see, as, upon touching the eye, it evinces no feeling. There is a line indicating where the mouth would have been, had it not been confined; but the mouth has never been opened. Several deformities were also observable; and the spine, which has been forced to develop itself in an angular form, appears a sufficient proof of its having grown in very confined space, even if the hollow in the piece of shale, by corresponding to the shape of the back, did not place the matter beyond a reasonable doubt. The frog continues to increase in size and weight, though no food can be given to it; and its vitality is preserved only by breathing through the thin skin covering the lower jaw. Mr W. Ellis, with a view of giving his prize as much publicity as possible, has deposited it at the New Inn, Merthyr, where it is exhibited as 'the greatest wonder in the world, a frog found in a stone forty-five feet from the surface of the earth, where it has been living without food for the last 5000 years!'

BOOK ERRORS.

The biographer of Francis Duke of Bridgewater, in the *Biographie Universelle*, states that the income-tax which he paid every year amounted alone to £110,000 sterling. The fact is, that in the returns which the duke made under the property-tax he estimated his income at that amount. Lalande, the French astronomer, designates the famous philosopher Ferguson, 'Berger au roi d'Angleterre en Ecosse'—the king of England's shepherd for Scotland. The fact is, he was merely, for a few early years of his life, shepherd to a small farmer in the neighbourhood of Keith in Banffshire. Thomas Holcroft translated Madame Genlis's *Veillées du Chateau* with the incorrect title of *Tales of the Castle*, instead of *Evenings at the Country House*. Every one has heard of Shakspeare's singular mistake as to the geography of Bohemia, and his supposition that Tunis and Naples were at an immeasurable distance from each other. But his error is not greater than that of Apollonius Rhodius, who mentions the Rhone and the Po as meeting and discharging themselves into the Gulf of Venice; or that of Æschylus, who places the river Eridanus in Spain. The chorus in Buchanan's tragedy of *Jephtha* mentions, in very familiar terms, the wealth of Croesus, who was not born till about six hundred years after Jephtha. Smollett, in his *History of England*, states that the ancient Britons 'sowed no corn, and lived in cottages thatched with straw.' If they sowed no corn, how could they get straw in an age when they were wholly out off from the continent? In Youatt's *Treatise on the Horse*, p. 9, it is stated that 'the Barb has not the Arab's spirit or action;' yet at page 12 we are told 'the Barb excels the Arab in noble and spirited action.' A desire to appear very knowing as to the authorship of popular anonymous works is a frequent cause of amusing blunders. Thus in Bohn's *Guinea Catalogue* (1841), p. 260, we find a quotation from 'Lord Brougham's *Architecture of Birds*,' a work written by Mr Rennie; and in Nattali's *Catalogue*, February 1841, we read of 'Lord Brougham's *Pursuit of Knowledge*,' a work written by Mr Craik. In Thorpe's *Catalogue* (No. 1, 1841, p. 2), a book printed at Mexico is said to be an interesting specimen of 'the South American press.'

GURNEYISM.

This term—of whose meaning perhaps nineteen-twentieths of our readers are utterly ignorant—is applied to a new and particular kind of manuring, which has been employed with signal success by Mr Gurney, a farmer in East Cornwall. The operation consists in covering grass land with long straw, coarse hay, or other fibrous matter, about 20 lbs. to the fall; allowing this covering to lie till the grass spring through it (which it does with astonishing rapidity) to the desired length, and then raking it off to allow the beast to reach the pasture. The covering is then applied to another portion of the field; the operation of removal and covering being repeated so long as the straw or hay remains sufficiently entire to admit of convenient application. The merits of the system, which is yet in its infancy, was thus stated by Mr Gurney at a late meeting of the East Cornwall Experimental Club:—'About seven weeks since, he had covered half a field of grass of three acres in this manner, and about a fortnight ago, when examined, the increase had been found to be at the rate of upwards of 5000 lbs. per acre over the uncovered portion of the field. At that time the straw was raked off and laid in rows 12 feet apart on the field, and 115 sheep were put on the grass, with a view to eat it down as quickly as possible. After they had been there about a week, they were succeeded by 26 bullocks, to eat off the long grass remaining, and which the sheep had left. The field was thus grazed as bare as possible. The same straw was now again thrown over the same portion of the field from which it had been raked; and on inspection that morning, he had found the action going on as powerfully as on the former occasion. He thought the sheep, on first raking off the straw, were not so fond of the grass as they were of that uncovered; but after 24 hours' exposure to the sun and air, he thought they rather preferred it. He had 40 acres now under the operation, and in consequence of it, he had had grass when his neighbours had none.' Fibrous covering, or Gurneyism, as thus described, is certainly a cheap and convenient mode of manuring; all that is wanted is only further experiment to test its general applicability.

THE LAMENT OF THE IRISH EMIGRANT.

[BY THE HON. MRS BLACKWOOD.]

I'm sitting on the stile, Mary,
Where we sat side by side
On a bright May morning long ago,
When first you were my bride.
The corn was springing fresh and green,
And the lark sang loud and high,
And the red was on your lip, Mary,
And the love-light in your eye.

The place is little changed, Mary,
The day is bright as then,
The lark's loud song is in my ear,
And the corn is green again.
But I miss the soft clasp of your hand,
And your breath warm on my cheek,
And I still keep listening for the words
You never more may speak.

'Tis but a step down yonder lane,
And the little church stands near—
The church where we were wed, Mary;
I see the spire from here.
But the graveyard lies between, Mary,
And my step might break your rest;
For I've laid you, darling, down to sleep,
With your baby on your breast.

I'm very lonely now, Mary,
For the poor make no new friends;
But, oh! they love the better still
The few our Father sends.
And you were all I had, Mary;
My blessing and my pride;
There's nothing left to care for now,
Since my poor Mary died.

Yours was the good brave heart, Mary,
That still kept hoping on,
When the trust in God had left my soul,
And my arm's young strength was gone.
There was comfort ever on your lip,
And the kind look on your brow;
I bless you, Mary, for that same,
Though you cannot hear me now.

I thank you for the patient smile,
When your heart was fit to break,
When the hunger pain was gnawing there,
And you hid it for my sake!
I bless you for the pleasant word,
When your heart was sad and sore;
Oh! I'm thankful you are gone, Mary,
Where grief can't reach you more!

I'm bidding you a long farewell,
My Mary—kind and true!
But I'll not forget you, darling,
In the land I'm going to.
They say there's bread and work for all,
And the sun shines always there;
But I'll not forget old Ireland,
Were it fifty times as fair.

And often in those grand old woods
I'll sit, and shut my eyes,
And my heart will travel back again
To the place where Mary lies.
And I'll think I see the little stile
Where we sat side by side,
And the springing corn, and the bright May morn,
When first you were my bride!

—From an old newspaper.

FORBEARANCE.

If the peculiarities of our feelings and faculties be the effect of variety of excitement through a diversity of organisation, it should tend to produce in us mutual forbearance and toleration. We should perceive how nearly impossible it is that persons should feel and think exactly alike upon any subject. We should not arrogantly pride ourselves upon our virtues and knowledge, nor condemn the errors and weakness of others, since they may depend upon causes which we can neither produce nor easily counteract. No one, judging from his own feelings and powers, can be aware of the kind or degree of temptation or terror, or the seeming incapacity to resist them, which may induce others to deviate.—*Abernethy.*

THE SCIENTIFIC MEETING AT CAMBRIDGE.

FROM the accounts given in this journal of the meetings of the British Association at Glasgow and at York, our readers are aware that we regard that body and its proceedings in a favourable light. It has always appeared to us that a good end is served when men can be brought into personal association for the promotion of common objects and the enjoyment of common pleasures, as such meetings are usually found to insure harmony where otherwise there might be hostility, or at least indifference, and much can, of course, be done by combination, where single efforts would be useless. The British Association is also serviceable in awakening and stimulating efforts in behalf of science in the special districts where it meets, and in introducing local objects of scientific and general interest to the notice of many persons who otherwise would remain ignorant of them. It affords, likewise, a brief period of pleasant excitement and recreation to multitudes of studious persons greatly in need of relief from the monotony of their ordinary toils: even on this inferior ground, it could be defended from the ridicule with which certain members of the public press are pleased to assail what assuredly does no harm to any one, whatever may be the amount of positive good which it effects.

The meeting of the present year (June 18—25) took place at Cambridge, where it had assembled for its third session (1833). It was allowed to be a good meeting in point of attendance (between a thousand and eleven hundred members), and there never had been any at which so many distinguished foreign savants were present. In one point of great importance, though of little popular interest, namely, the meteorological observations, it stands above all former meetings. Apart from this, it was not scientifically very brilliant, though it presented several salient points of considerable interest. One external circumstance added much to the enjoyment of all concerned, that the meeting was favoured throughout with the most beautiful weather.

On arriving in Cambridge on the evening of the 18th, we found, as usual, all bustle and excitement at the reception-room, which on this occasion was in the town-hall. Many members being accommodated in the colleges, we experienced little difficulty in procuring an agreeable lodging; which important preliminary being settled, we sauntered forth to enjoy an evening walk amidst the august shades of those piles of past centuries in which English Morning is sheltered—a scene always striking to a Scotchman, as being so different from anything of an analogous nature in his own country. And verily, as we saw the lofty spires of King's College chapel and of Trinity piercing the blue of a June night, and tipped with its palely stars, we could have fancied ourselves transported into a scene

realised out of eastern fable. We bethought us of the power of even external beauty in protecting the institutions here established. The most daring innovator might come hither full of eagerness to meddle with systems unquestionably representative rather of past centuries than the present, and we can conceive him so captivated through the agency of the mere aesthetics of the place, that, like Alaric awed by the venerableness of the Roman senate, into which he had intruded, our innovator would shrink from his task, and leave the business of reform to ruder hands.

A sunbright morning saw the members hurrying to the various sectional meetings, according to their various predilections. The first section of which we shall speak—the Geological—we found accommodated in the senate-house, a beautiful Grecian building of about the time of Queen Anne, finely decorated within with carved wood-work, and having a platform with rising seats at the upper end, surmounted by a canopy under which the existing royalty of England had recently sat. This was by far the largest and best room enjoyed by any of the sections, and it was assigned to the geological because the meetings of that body are generally the most numerously attended. It may be mentioned parenthetically, that the geological is also the section usually most frequented by the ladies; indeed it is almost the only section which enjoys any share of feminine patronage. On the present occasion, we found a brilliant assemblage of both sexes seated on benches across the room, while Professor Sedgwick, Dr Buckland, Mr Murchison, Sir Henry de la Beche, and other chiefs of geological science, were mustering on the platform. Mr Sedgwick soon after assumed the presidency of the section, and proceeded, as an appropriate commencement of business, to give an exposition of the geology of the immediate neighbourhood of Cambridge. During this and subsequent days, the geological section maintained its character, as one which mingles more pleasantly with science than any of the rest. The fact is, that its leaders are men of lively and varied talents, who, being on the most friendly footing with each other, cannot meet even before a large miscellaneous audience without indulging in their customary familiarity of discourse. There was, therefore, hardly a paper read, or an exposition made, that was not followed by a conversation in which sober and instructive remarks were relieved by facetiæ more or less generally appreciable. The quick vivacious movements of Professor Sedgwick, whose ideas flow too rapidly even for an unusually rapid discourse, contrasted delightfully with the measured oratorical tone and grave demeanour in which the jocundities of Dr Buckland were enunciated. The audience on these occasions seemed to feel that it added much to the enjoyment of the knowledge imparted, that its authors should thus be able to come down, not indi-

cously, to the level of the unlearned. And here we may remark, that, at one of the general evening meetings, when the beautiful electro-magnetic machine of Mr Armstrong of Newcastle was exhibited, several of the physicists, as Sir David Brewster and Mr Faraday, joined heartily in the amusement occasioned by the shocks which were circulated amongst the ladies and gentlemen present. At one time, we observed a long loop of people with joined hands, extending through the multitude in the senate-house, somewhat like a party standing up for a country dance: several philosophers were of the number. When the engine was put in motion, the whole of these persons might have been seen in a kind of dance at one moment, from the effects of the electricity. Two minutes after, Mr Faraday was on the platform, expounding the nature of the agent that had excited them all so much, in language that introduced awe and deep feeling where recently nothing but merriment had been.

Of the other sections, two were on this occasion hardly existent, namely, the Medical and Mechanical. The rest were active, and to make up in some degree for the failure of these, there was a sub-section for the new science of Ethnology (the characters of nations), which abounded in valuable papers. Hereafter, the Medical is to appear under the title of the Physiological, so as to embrace a wider range of subjects. We now propose to present notices of a few of the most generally interesting matters brought before the various sections.

MR BONOMI ON CERTAIN GIGANTIC BIRDS OF FORMER TIMES.

The existence of slabs of the new red sandstone of America marked with footsteeps of large birds apparently of the stork species, is well known. As some of these animals are calculated to have been fifteen feet high, they were at first supposed to have no parallel in the present state of nature; but this was soon found to be not the case, as several specimens of the bones of a bird not less gigantic have since been sent home from New Zealand, where it is spoken of by the natives as recently existing under the name of *Moa*. There have also been discovered by Captain Flinders, on the south coast of New Holland, in King George's Bay, some very large nests, measuring twenty-six feet in circumference and thirty-two inches in height; resembling, in dimensions, some that are described by Captain Cook, as seen by him on the north-east coast of the same island, about 15 degrees south latitude. It would appear, by some communications made to the editor of the *Athenæum*, that Professor Hitchcock of Massachusetts had suggested that these colossal nests belonged to the *Moa*. In connection with these discoveries is another from an opposite quarter. Between the years 1821 and 1823, Mr James Burton discovered on the west coast, or Egyptian side of the Red Sea, opposite the peninsula of Mount Sinai, at a place called *Gebel Ezzeit*, where, for a considerable distance, the margin of the sea is inaccessible from the Desert, three colossal nests within the space of one mile. These nests were not in an equal state of preservation; but, from one more perfect than the others, he judged them to be about fifteen feet in height, or, as he observed, the height of a camel and its rider. These nests were composed of a mass of heterogeneous materials, piled up in the form of a cone, and sufficiently well put together to insure adequate solidity. The diameter of the cone at its base was estimated as nearly equal to its height, and the apex, which terminated in a slight concavity, measured about two feet six inches or three feet in diameter. The materials of which the great mass was composed were sticks and weeds, fragments of wreck, and the bones of fishes; but in one was found the thorax of a man, a silver watch made by George Prior, a London watchmaker of the last century, celebrated throughout the East, and in the nest or basin at the apex of the cone, some pieces of woollen cloth and an old shoe. That these nests had been but recently constructed, was sufficiently evident

from the shoe and watch of the shipwrecked pilgrim, whose tattered clothes and whitened bones were found at no great distance; but of what genus or species had been the architect and occupant of the structure, Mr Burton could not, from his own observation, determine. From the accounts of the Arabs, however, it was presumed that these nests had been occupied by remarkably large birds of the stork kind, which had deserted the coast but a short time previous to Mr Burton's visit. 'To these facts,' said Mr Bonomi, 'I beg to add the following remarks:—Among the most ancient records of the primeval civilisation of the human race that have come down to us, there is described, in the language the most universally intelligible, a gigantic stork bearing, with respect to a man of ordinary dimensions, the proportions exhibited in the drawing before you, which is faithfully copied from the original document. It is a bird of white plumage, straight and large beak, long feathers in the tail; the male bird has a tuft at the back of the head, and another at the breast; its habits apparently gregarious. This very remarkable painted basso-relievo is sculptured on the wall, in the tomb of an officer of the household of Pharaoh Shufu (the Suphis of the Greeks), a monarch of the fourth dynasty, who reigned over Egypt while yet a great part of the Delta was intersected by lakes overgrown with the papyrus—while yet the smaller ramifications of the parent stream were inhabited by the crocodile and hippopotamus—while yet, as it would seem, that favoured land had not been visited by calamity, nor the arts of peace disturbed by war; so the sculpture in these tombs intimate, for there is neither horse nor instrument of war in any one of these tombs. At that period, the period of the building of the Great Pyramid, which, according to some writers on Egyptian matters, was in the year 2100 B.C., which, on good authority, is the 240th year of the deluge, this gigantic stork was an inhabitant of the Delta, or its immediate vicinity; for, as these very interesting documents relate, it was occasionally entrapped by the peasantry of the Delta, and brought with other wild animals, as matters of curiosity, to the great landholders or farmers of the products of the Nile—of which circumstance this painted sculpture is a representation, the catching of fish and birds, which in these days occupied a large portion of the inhabitants. The birds and fish were salted. That this document gives no exaggerated account of the bird, may be presumed from the just proportion that the quadrupeds, in the same picture, bear to the men who are leading them; and, from the absence of any representation of these birds in the less ancient monuments of Egypt, it may also be reasonably conjectured they disappeared soon after the period of the erection of these tombs. With respect to the relation these facts bear to each other, I beg to remark, that the colossal nests of Captains Cook and Flinders, and also those of Mr James Burton, were all on the sea-shore, and all of those about an equal distance from the equator. But whether the Egyptian birds, as described in those very ancient sculptures, bear any analogy to those recorded in the pages of the great stone book of nature (the new red sandstone formation), or whether they bear analogy to any of the species determined by Professor Owen from the New Zealand fossils, I am not qualified to say, nor is it indeed the object of this paper to discuss; the intention of which being rather to bring together these facts, and to associate them with that recorded at Gezah, in order to call the attention of those who have opportunity of making further research into this interesting matter.'

DISTRIBUTION OF ELANTS.

Professor Edward Forbes, of King's College, excited great interest in the Natural History section by a curious speculative paper respecting the distribution of plants. He started with the proposition, that, admit-

ting or assuming the theory, that there have been several distinct centres of creation for plants (the idea now paramount amongst naturalists), the isolation or separation of assemblages of individual plants from their centres, and the existence of *endemic* or very local plants, are not satisfactorily accounted for by the agency of the sea, rivers, and winds, and carriage by animals, or through the agency of man. 'It is usual to say' (here we quote from Mr Forbes's abstract*), 'that the presence of many plants is determined by soil or climate, as the case may be; but if such plants be found in areas disconnected from their centres by considerable intervals, some other cause than the mere influence of soil or climate must be sought to account for their presence. This cause the author proposes to seek in an ancient connexion of the outposts or isolated areas with the original centres, and the subsequent isolation of the former through geological changes and events, especially those dependent on the elevation and depression of land. Selecting the flora of the British islands for a first illustration of this view, Professor Forbes calls attention to the fact, well known to botanists, of certain species of flowering plants being found indigenous in portions of that area at a great distance from the nearest assemblages of individuals of the same species in countries beyond it. Thus many plants peculiar in the British flora to the west of Ireland, have the nearest portion of their specific centres in the north-west of Spain; others confined with us to the south-west promontory of England, are, beyond our shores, found in the Channel Isles and the opposite coast of France; the vegetation of the south-east of England is that of the opposite part of the continent; and the Alpine vegetation of Wales and the Scotch Highlands is intimately related to that of the Norwegian Alps. The great mass of the British flora has its most intimate relations with that of Germany. The vegetation of the British islands may be said to be composed of five floras:—1st, A west Pyrenean, confined to the west of Ireland, and mostly to the mountains of that district; 2d, A flora related to that of the south-west of France, extending from the Channel Isles, across Devon and Cornwall, to the south-east and part of the south-west of Ireland; 3d, A flora common to the north of France and south-east of England, and especially developed in the chalk districts; 4th, An Alpine flora, developed in the mountains of Wales, north of England, and Scotland; and, 5th, A Germanic flora, extending over the greater part of Great Britain and Ireland, mingling with the other floras, and diminishing, though slightly, as we proceed westwards, indicating its easterly origin and relation to the characteristic flora of northern Germany. Interspersed among the members of the last-named flora, are very few specific centres peculiar to the British isles. The author numbers in ascending order these floras, according to their magnitude as to species, and also, in his opinion, according to their relative age and period of introduction into the area of the British islands. His conclusions on this point are the following:—

'1. The oldest of the floras now composing the vegetation of the British isles is that of the mountains of the west of Ireland. Though an Alpine flora, it is southernmost in character, and is quite distinct as a system from the floras of the Scottish and Welsh Alps. Its very southern character, its limitation, and its extreme isolation, are evidences of its antiquity, pointing to a period when a great mountain barrier extended across the Atlantic from Ireland to Spain.

'2. The distribution of the second flora, next in point of probable date, depended on the extension of a barrier, the traces of which still remain, from the west of France to the south-east of Britain, and thence to Ireland.

'3. The distribution of the third flora depended on the connexion of the coast of France and England towards the eastern part of the Channel. Of the former existence of this union no geologist doubts.

'4. The distribution of the fourth, or Alpine flora of Scotland and Wales, was effected during the glacial period, when the mountain summits of Britain were low islands, or members of chains of islands, extending to the area of Norway through a glacial sea, and clothed with an arctic vegetation, which, in the gradual upheaval of those islands, and consequent change of climate, became limited to the summits of the new-formed and still-existing mountains.

'5. The distribution of the fifth, or Germanic flora, depended on the upheaval of the bed of the glacial sea, and the consequent connexion of Ireland with England, and of England with Germany, by great plains, the fragments of which still exist, and upon which lived the great elk and other quadrupeds now extinct.

'The breaking up or submergence of the first barrier led to the destruction of the second; that of the second to that of the third; but the well-marked epoch of migration of the Germanic flora indicates the subsequent formation of the Straits of Dover and of the Irish Sea, as now existing.

'To determine the probable geological epoch of the first or west Irish flora—a fragment perhaps with that of north-western Spain, of a vegetation of the true Atlantic—we must seek among fossil plants for a furthermost starting point. This we get in the flora of the London clay, or eocene, which is tropical in character, and far anterior to the oldest of the existing floras. The geographical relations of the miocene sea, indicated by the fossils of the crag, give an after-date certainly to the second and third of the above floras, if not to the first. The epoch of the red or middle crag was probably coeval with the second flora; that of the mammaliferous crag with the third. The date of the fourth is too evident to be questioned; and the author regards the glacial region in which it flourished as a local climate, of which no true traces, as far as animal life is concerned, exist southwards of his second and third barriers. This was the newer pliocene epoch. The period of the fifth flora was that of the post-tertiary, when the present aspect of things was organised.

'Adopting such a view of the relations of these floras in time, the greatest difficulties in the way of changes of the earth's surface and destruction of barriers—deep sea being found where land (probably high land) was—are removed, when we find that those greater changes must have happened during the epoch immediately subsequent to the miocene period; for we have undoubted evidence that elsewhere, during that epoch, the miocene sea-bed was raised 6000 feet in the chain of Taurus, and the barriers forming the westward boundary of the Asiatic eocene lakes so completely annihilated, that a sea several hundred fathoms deep now takes their probable place. The changes required for the events which the author would connect with the peculiar distribution of the British flora, are not greater than these.

'Professor Forbes maintains that the peculiar distribution of endemic animals, especially that of the terrestrial mollusca, bears him out in these views. He proposes to pursue the subject in detail, with reference both to animal and vegetable life, in connexion with the researches of the geological survey.'

EXPERIMENTS OF PROFESSOR BOUTIGNY—FREEZING OF WATER IN RED-HOT VESSELS.

No subject before the Association excited more popular interest than certain experiments performed in the Chemical section by Professor Boutigny. The room of assembly being small, it was impossible that one-half of those desirous of witnessing the experiments could be admitted. They were repeated, and yet, on the second occasion, many, amongst whom were ourselves, went away ungratified. The exposition of M. Boutigny, which was in French, referred to the 'spheroidal state of bodies, and the application of this knowledge to steam-boilers.' As is well known from every-day experience, when drops of water are thrown upon red-hot

* Literary Gazette, June 23.

iron, they assume a spherical form. It is not so well known that the drops, in these circumstances, remain at a minute distance apart from the iron, and that the heat of the plate is not communicated to them. M. Boutigny showed on this occasion a red-hot platinum cup, with a small quantity of water dancing about in it like a globe of glass, without boiling. When the metal, however, cools down to a certain point, the water comes in contact with it, heat is communicated, boiling takes place, and the water quickly evaporates. The same result is observed when any substance capable of assuming a globular form is placed on a heated surface; in proof of which the professor placed in the heated cup of platinum, iodine, ammonia, and some inflammable fluid, each of which became globular, and danced about like the globule of water, but without emitting vapour or smell, or being inflamed, till the platinum was cooled. M. Boutigny also heated a silver weight, of the same shape as the weight of a clock, until it was red-hot, and then lowered it by a wire into a glass of cold water, without there being the slightest indication of action in the water, more than if the weight had been quite cold. The experimentalist advanced no theory to account for these peculiar actions, further than that a film of vapour intervenes between the heated body and the substance, which prevents the communication of heat. The facts, however, he thought were of importance in a practical point of view, both in the tempering of metals and in the explanation of the causes of steam-boiler explosions. From these experiments, it would appear that, in tempering metals, if the metal be too much heated, the effect of plunging it into water will be diminished. In steam-boilers also, if the water be introduced into a heated surface, the heat may not be communicated to the water, and the boiler may become red-hot, and without any great emission of steam; until at length, when the boiler cools, a vast quantity of steam may be generated, and the boiler burst. The last and most curious experiment performed by M. Boutigny was the freezing of water in a red-hot vessel. It has been thus described in the *Literary Gazette's* report:—'If any substance boils below the freezing point of water, that same substance would be below its own boiling point; and therefore water in contact would be frozen. Sulphurous acid is such a substance; and consequently, sulphurous acid in an incandescent crucible in the spheroidal shape is itself colder than ice: in addition, however, to its own coldness, it evaporates when touched by the water; therefore intense cold is produced, and the water instantly freezes.' The sight of water put into a red-hot crucible, and almost instantly turned out upon the experimenter's hand a mass of ice, elicited loud and continued applause.

MODIFICATIONS OF SHELLS IN SUCCESSIVE STRATA IN THE ISLAND OF COS.

Professor Edward Forbes made a joint communication for himself and Captain Sprat, R.N., on a remarkable phenomenon connected with certain fresh-water tertiary strata in the island of Cos. In a diagram exhibited, three such strata, marked A, B, and C, in ascending succession, lay against a mass of scaglia, and were unconformably surmounted with a marine formation. In stratum A, there were shells of well-known species of fresh-water mollusca, especially paludina and peretina: as usual, their convolutions were devoid of ribbings or humps. But in stratum B, the same shells were found with a hump on each convolution; and in stratum C, the same shells had three humps. There were here appearances of either a transmutation of species, or a creation of new species, neither of which propositions he was willing to admit. He had therefore suppressed the surprise he felt at the phenomenon for upwards of two years, until at length a better explanation had occurred to him. It had been ascertained, that when fresh-water molluscs were put into brackish water, their shells in time experienced a distortion, provided that the species could survive and propagate

in such circumstances. He was therefore of opinion that an intrusion of the sea had taken place in the fresh-water lake in which stratum B was formed, and that this had been attended by the destruction of several of the weaker-lunged species which appear in A, and the distortion of the shells of the stronger-lunged (pectenibranchiate) which remained. In stratum C, more salt water had come in, and increased the deformities, as described. There was thus a modification of forms, but not a change of species. At the conclusion of this paper, which was listened to with great interest, Mr Lyell and other gentlemen present stated other instances of a change of figure experienced by fresh-water molluscs which had been exposed to the influence of salt water. It has the effect of dwarfing and distorting them.

DR BUCKLAND ON THE AGENCY OF LAND SNAILS IN FORMING HOLES AND TRACKWAYS IN COMPACT LIMESTONE.

The learned doctor here made further observations on a subject which he had brought before the Association four years ago, and which, he complained, had then and since been treated with much scepticism. He had found limestone at various places (Tenby, Boulogne, Plymouth) presenting surfaces downwards, and in these surfaces there were holes in which land snails were sheltered. In some instances, these holes were several inches deep, and in a few, two or three met together in the interior of the stone. Dr Buckland said he had found these marked surfaces invariably in the neighbourhood of pastures where snails were numerous; and so certain was their appearance in certain circumstances, that oftener than once he had, in travelling, pointed to a rock as one that would be found marked, and it had proved to be so. He exhibited specimens of limestone from several localities, showing perforations still containing the shells of snails, or furrows leading to the perforations, and he insisted that these were unlike any that are produced by other causes. The fact of their always being on the under surfaces of ledges, and thus presented downwards, proved that they were independent of atmospheric causes. He did not mean that the snails required holes for their residence; but he maintained that the perforations were a result of their sheltering there, and acid exuding from their skin being the agent which wore down the stone. Dr Buckland had even made some approach to an ascertainment of the rate at which the stone becomes perforated. He had found the lower faces of the ledges in the wall of Richborough castle marked in this manner to the depth of about an inch and a half. Richborough was a work of the Romans, who had left it fourteen hundred years ago. Assuming that the snails commenced operations at that time, it appeared that they wrought their way into the stone at the rate of an inch in a thousand years.

The reading of this paper excited some merriment; but the view taken by Dr Buckland of the operation of the snails was generally acceded to; and its being one of no unimportant character in science, is shown by its demolishing an inference which had been drawn from certain perforated rocks, as evidence of a raised beach. It is now seen, that what a former inquirer deemed to have been effected by the wearing action of the sea, was the work of a few humble land snails.

Besides the meetings at the seven sections, there were general assemblages in the evening at the senate-house: the first, on Thursday evening, was devoted to the business of installing the president elect, Sir John Herschel. The Dean of Ely (Dr Peacock), the president of the past year, introduced his successor in terms which were almost affecting, from the allusion they contained to the two men having been competitors thirty-two years before for college honours. Sir John, on taking the chair, replied with like feeling, and read an address embracing a variety of philosophical subjects. It was painful to find that this eminent person, while possessing the usual appearances of health, has

lost the power of making himself heard at any considerable distance. His address has, however, been published, and we extract from it a passage regarding that which has chiefly distinguished the meeting of this year—the congress of meteorologists. Of these, he mentioned as present M. Kupffer, the Director-General of the Russian System of Magnetic and Meteorological Observation; M. Ermann, the celebrated circumnavigator and meteorologist; Baron Von Seftenborg; M. Kreil, Director of the Imperial Observatory at Prague; M. Boguslawski, Director of the Royal Prussian Observatory at Breslau—all of whom had come on purpose to afford to the meeting the benefit of their advice and experience. 'Every member,' said Sir John, 'is aware of the great exertions which have been made during the last five years, on the part of the British, Russian, and several other foreign governments, and of our own East India Company, to furnish data on the most extensive and systematic scale, for elucidating the great problems of terrestrial magnetism and meteorology, by the establishment of a system of observatories all over the world, in which the phenomena are registered at instants strictly simultaneous, and at intervals of two hours throughout both day and night. With the particulars of these national institutions, and of the multitude of local and private ones of a similar nature both in Europe, Asia, and America, working on the same concerted plan, so far as the means at their disposal enable them, I need not detain you: neither need I enter into any detailed explanation of the system of magnetic surveys, both by sea and land, which have been executed, or are in progress, in connexion with, and based upon, the observations carried on at the fixed stations. These things form the subject of special annual reports, which the committee appointed for the purpose have laid before us at our several meetings, ever since the commencement of the undertaking; and the most recent of which will be read in the Physical section of the present meeting, in its regular course. It is sufficient for me to observe, that the result has been the accumulation of an enormous mass of most valuable observations, which are now, and have been for some time, in the course of publication; and when thoroughly digested and discussed, as they are sure to be, by the talent and industry of magnetists and meteorologists, both in this country and abroad, cannot fail to place those sciences very far indeed in advance of their actual state.'

The general meeting of Friday evening was distinguished by a singularly able and lucid popular exposition of the subject of the earth's magnetism by the astronomer-royal, Professor Airey. On Saturday evening there was a promenade, which excited little interest. On Monday, Mr Murchison treated the members with a discourse on the geology of Russia, which subject he has been engaged in investigating for five years, and on which he is about to publish an elaborate work. It appears that the various formations of that vast region present mainly the same records of animal life as the corresponding strata in England, thus adding to the evidence that these formations are chronicles of the advance of life from mean to exalted forms during certain definite eras of the earth's existence. The surfaces covered by single formations in Russia, are in some instances as large as the whole of England. Mr Murchison also showed that there formerly existed in Russia a huge Mediterranean sea, whose boundaries were from the Volga to the sea of Azof, the Caspian extending to an immense distance, even to Chinese Tartary.

On the evening of Tuesday there was another promenade, which was enlivened by the exhibition of Mr Armstrong's magneto-electric machine. The last evening meeting, on Wednesday, was devoted to general business, and brought from the chiefs of the Association several eloquent speeches. It was now announced that the next meeting should take place in Southampton in the month of September 1846, under the presidency of Mr Murchison.

The Association, during the week of the meeting, had the privilege of entrée to the observatory, a little way out of town, to the college halls, chapels, libraries, and museums, and to a model-room where a few curious objects had been collected. Amongst these we were most struck by a series of preparations in the anatomy of the invertebrate animals, the work of Mr Goadby. This gentleman has devoted an ingenious and indefatigable mind for five-and-twenty years to such preparations, and he has now attained a degree of dexterity in the work, which leaves everything of the kind at an immeasurable distance. First, dismissing the cylindrical bottles, as distorting all objects placed in them, he adopts cubical glass cases, formed of soldered plates, through which each feature is seen in its exact proportions. Second, he presents animals in various appearances: one case, for instance, will give the alimentary system; another the nervous; and so on. He even studies by what colour of paper, as a background, he can best bring out the lineaments of the objects. These preparations were universally admired; and the preparer excited much amusement when he took out a brooch containing a beetle so perfectly preserved in spirits, that not a shade of colour on its wings was tarnished.

The hospitalities of the colleges on this occasion were of a moderate kind, and there was little of that mutual flattery in which such bodies are apt to indulge on social occasions. We would still remark, that, to persons like ourselves, of whom there must be many, who come for the love of science alone, and enjoy but little acquaintance with its cultivators, there sometimes appears a slight offensiveness in a certain tone of over-good fellowship which frequently bursts out amongst the leaders of the Association in public. There is something provoking in it to the uninitiated. Turning to a graver matter, we cannot but sympathise a little in the disappointment so often felt by the public with regard to the matters brought forward at the Association. There are many valuable isolated facts, but there never is such a thing as a comprehensive view of nature in any of her departments. At the beginning of the Royal Society, men were bringing forward observations on particular matters; they are doing the same at this day, though six generations have meanwhile gone to dust. Common minds see no sense in this wasting of life in the establishment of new species of moths and ascertainment of new laws presiding over the heating of bodies. They call for something either offering great practical advantages, or opening up new and better views of the relation in which we stand to the great agencies external to ourselves. It is all very well to decry rash generalisation; but while science professes to show merely a collection of bricks towards the building of a house, it will never get any credit as an architect, and the popular apprehension of the value of its researches will be dubious and obscure.

ASCENT OF MAUNA LOA.

Of the thousands whom description has rendered familiar with *Ætna*, *Vesuvius*, and *Hecla*, few may have even heard of the equally imposing phenomena that present themselves to the navigator of the Pacific. Among the fiery cones and simmering craters of Polynesia, those of Hawaii, one of the Sandwich islands, are by far the most gigantic—their elevation being such as to retain a perpetual cap of snow, though situated directly under the tropics. Hawaii, so memorable for the murder of Captain Cook, is of an irregular form, fully 260 miles in circumference, and from shore to shore entirely of volcanic origin. So extremely irregular is its surface, that not a square mile of level ground is to be found; in fact, it may be said to be one vast mountain, or rather congeries of mountains, having a common base, and heaving their cones to the height of thirteen, fourteen, and sixteen thousand feet above the level of the sea. The three most remarkable prominences are Mauna Kea, Mauna Loa, and Mauna Hualalai, that of Loa being still in active combus-

tion, and vomiting forth floods of lava from various points of its surface. This mountain is described as a vast dome, sixty miles in diameter, and nearly three miles in height, having a shoulder or terrace on its eastern slope, in which is situated the active crater of Kilauea, unsurpassed for grandeur and magnitude by any similar phenomena. It is thus that Mauna Loa has been an object of the greatest interest to navigators ever since the discovery of these islands, and that we have had accounts of the partial or complete ascents by Byron, David Douglas the botanist, Dr Gardner, and by the recent Exploring Expedition of the United States. In the beginning of 1841, the officers of this expedition pitched their surveying tent on the highest scalp, gauged and fathomed the craters, cooked their food in the steam fissures—altogether accomplishing a sojourn replete with the most spirited adventure. A brief outline of the commander's narrative cannot fail to interest and inform the reader.

Having procured guides and baggage-men, and being fully equipped for a three weeks' sojourn, the party commenced their ascent on the 10th of December 1840. Having reached Olaa, 1138 feet above the level of the sea, they halted to rest and inspect their forces. From this point, they had no distinct path to follow, but scrambled over masses of lava. After considerable labour, they reached the great plain of the volcano, at an elevation of 4000 feet, where Mauna Loa burst upon them in all its grandeur. 'The day,' proceeds the narrator, 'was extremely fine, the atmosphere pure and clear, except a few flying clouds, and this immense dome rose before us from a plain some twenty miles in breadth. I had not until then formed any adequate idea of its magnitude and height. The whole dome appeared of a bronze colour, and its uninterrupted smooth outline was relieved against the deep blue of a tropical sky. Masses of clouds were floating around it, throwing their shadows distinctly on its sides, to which they gave occasional relief and variety. There was a bluish haze resting on the plain, that apparently gave it great distance, though this was partially counteracted by the distinctiveness of the dome. I now, for the first time, felt the magnitude of the task I had undertaken.'

'So striking was the mountain, that I was surprised and disappointed when called upon by my friend Dr Judd to look at the crater of Kilauea; for I saw nothing before us but a huge pit, black, ill-looking, and totally different from what I had anticipated. There were no jets of fire, no eruptions of heated stones, no cones, nothing but a depression, that, in the midst of the vast plain by which it is surrounded, appeared small and insignificant. At the further end was what appeared a small cherry-red spot, whence vapour was issuing, and condensing above into a cloud of silvery brightness. This cloud, however, was more glorious than any I had ever beheld, and the sight of it alone would have repaid the trouble of coming thus far.'

'We hurried to the edge of the cavity, in order to get a view of its interior, and as we approached, vapour issuing from numerous cracks showed that we were passing over ground beneath which fire was raging. The rushing of the wind past us was as if it were drawn inwards to support the combustion of some mighty conflagration. When the edge is reached, the extent of the cavity becomes apparent, and its depth became sensible by comparison with the figures of some of our party who had already descended. The vastness thus made sensible, transfixes the mind with astonishment, and every instant the impression of grandeur and magnitude increases. To give an idea of its capacity, the city of New York might be placed within it, and when at its bottom, would be hardly noticed; for it is three and a half miles long, two and a half wide, and over a thousand feet deep. A black ledge surrounds it at the depth of six hundred and sixty feet, and thence to the bottom is three hundred and eighty-four feet. The bottom looks, in the daytime, like a heap of smouldering ruins. The descent to the ledge appears to the sight a short and easy task, but it takes an hour to accomplish.'

'We pitched our tents in full view of the volcano, on

its western side, and the natives busied themselves in building temporary huts to shelter them from the cold blast that rushed by. All this was accomplished, and we had time to take another view of the crater before dark.'

'All usual ideas of volcanic craters are dissipated upon seeing this. There is no elevated cone, no igneous matter or rocks ejected beyond the rim. The banks appear as if built of massive blocks, which are in places clothed with ferns, nourished by the issuing vapours. What is wonderful in the day, becomes ten times more so at night. The immense pool of cherry-red liquid lava, in a state of violent ebullition, illuminates the whole expanse, and flows in all directions like water, while the illuminated cloud hangs over it like a vast canopy.'

'We sat on its northern bank for a long time in silence, until one of the party proposed we should endeavour to reach the bank nearest to and over the lake; and having placed ourselves under the direction of Mr Drayton, we followed him along the edge of the western bank; but although he had been over the ground the day before, he now lost his way, and we found ourselves still on the upper bank, after walking two or three miles. We then resolved to return to the first place that appeared suitable for making a descent, and at last one was found, which, however, proved steep and rugged. In the darkness we got many a fall, and received numerous bruises; but we were too near the point of our destination to turn back without fully satisfying our curiosity. We finally reached the second ledge, and soon came to the edge of it: we were then directly over the pool or lake of fire, at the distance of about five hundred feet above it; and the light was so strong, that it enabled me to read the smallest print. This pool is fifteen hundred feet long by one thousand wide, and of an oval figure.'

'I was struck with the absence of any noise, except a low murmuring like that which is heard from the boiling of a thick liquid. The ebullition was (as is the case where the heat is applied to one side of a vessel) most violent near the northern side. The vapour and steam that were constantly escaping were so rarefied as not to impede the view, and only became visible in the bright cloud above us, which seemed to sink and rise alternately. We occasionally perceived stones, or masses of red-hot matter, ejected to the height of about twenty feet, and falling back into the lake again.'

'The lake was apparently rising, and wanted but a few feet of overflowing its banks. When I began to reflect upon the position we were in, its insecurity, and the vast and deep fires beneath, with the high basaltic walls encompassing us on all sides, the sulphureous fumes and broad glare, throwing such enormous masses of stone in strong relief by their own fusion, I found it difficult to comprehend how such a reservoir can thus be pent up, and be viewed in such close proximity, without accident or danger. The whole party was perfectly silent, and the countenance of each individual expressed the feeling of awe and wonder which I felt in so great a degree myself, and which the scene was so well calculated to excite.'

Having determined to encamp at Kilauea for a few days, the exploration of the crater was the next subject that engaged their attention. This was done with great difficulty and no little danger. 'The pathway leads down on the north-east side over frightful chasms, sometimes on a mere edge of earth, and on rocks rent asunder to the depth of several hundred feet. Through these fissures steam issues, which, as it reaches the upper part, condenses, and gives nourishment to masses of ferns, and an abundance of small bushes (vaccinium), bearing a small berry of an agreeable flavour, called by the natives ohela. The descent, however, is not in reality difficult, except in a few places, where it requires some care in passing over the basaltic blocks, that are here piled in confused heaps. On approaching the black ledge, which from above appeared level and smooth, it is seen to be covered with large pieces of lava, rising in places into cones thirty or forty feet high, which are apparently bound down by huge tortuous masses, which surround them like cables. In other places these are stretched lengthwise on the level

ledge, and look like hideous fiery serpents with black vitreous scales, that occasionally give out smoke, and in some cases fire.

'The immense space which I have described the crater as covering, is gradually filled with the fluid mass of lava to a certain point, above which the walls, or the surrounding soil, are no longer able to bear the pressure; it then finds vent by an eruption, previous to which, however, a large part that is next to the walls of the crater has in a measure become cooled, and remains fixed at the level it had attained. After the eruption, the central mass therefore alone subsides three or four hundred feet, and leaves the portion that has become solid, forming a kind of terrace or shelf: this is what constitutes the "black ledge," and is one of the most striking features of the crater. Its surface is comparatively level, though somewhat uneven, and is generally coated with a vitreous, and in some places a scoriaceous lava, from half an inch to an inch thick, very iridescent and brittle. In walking over this crust, it crumbles and cracks under the feet: it seems to be easily decomposed, and in some places had lost its lustre, having acquired a grayish colour, and become friable.

'To walk on the black ledge is not always safe, and persons who venture it are compelled for safety to carry a pole, and feel before they tread over the deceitful path, as though they were moving on doubtful ice. The crackling noise made in walking over this crisp surface (like a coating of blue and yellow glass) resembles that made by treading on frozen snow in very cold weather. Here and there are seen dark pits and vaulted caverns, with heated air rushing from them. Large and extended cracks are passed over, the air issuing from which, at a temperature of 180 degrees, is almost stifling. Masses are surmounted that it would seem as if the accumulated weight of a few persons would cause to topple over, and plunge the whole into the fiery pool beneath.

'On approaching the large lake at the southern end of the crater, the heat becomes almost too stifling to bear. I shall not soon forget my employment therein, in measuring a base to ascertain the extent and capacity of the lake, of which some account will be given hereafter. At about two-thirds of the distance from the north end are extensive sulphur banks, from the fissures in which much steam is continually escaping: in these fissures are seen many beautiful crystals adhering to their sides; while on the bank itself, some specimens of sulphate of copper, in beautiful blue crystals, were found.

'From many places on the black ledge a bluish smoke was seen issuing, smelling strongly of sulphur, and marked by an efflorescence of a white tasteless powder among the cavities: this it was difficult to detach without scalding the fingers. There were many cracks where our sticks were set on fire, and some places in the vaulted chambers beneath where the rock might be seen red-hot.

'The black ledge is of various widths, from six hundred to two thousand feet. It extends all around the cavity, but it is seldom possible to pass around that portion of it near the burning lake, not only on account of the stifling fumes, but of the intense heat. In returning from the neighbourhood of the lake to the point where we began the ascent, we were one hour and ten minutes of what we considered hard walking; and in another hour we reached the top of the bank. This will probably give the best idea of its extent, and the distance to be passed over in the ascent from the black ledge, which was found six hundred and sixty feet below the rim.

'To the bottom of the crater there was a descent at the north-west angle of the black ledge, where a portion of it had fallen in, and afforded an inclined plane to the bottom. This at first appeared smooth and easy to descend, but on trial it proved somewhat difficult, for there were many fissures crossing the path at right angles, which it was necessary to get over, and the vitreous crust was so full of sharp spicules, as to injure the hands and cut the shoes at every step. Messrs Waldron and Drayton, after much toil, finally reached the floor of the crater. This was afterwards ascertained to be three hundred and eighty-four feet below the black ledge, making the whole depth nine hundred and eighty-seven feet below the northern

rim. Like the black ledge, it was not found to have the level and even surface it had appeared from above to possess: hillocks and ridges, from twenty to thirty feet high, ran across it, and were in some places so perpendicular, as to render it difficult to pass over them. The distance they traversed below was deceptive, and they had no means of ascertaining it but by the time it took to walk it, which was upwards of two hours, from the north extreme of the bottom to the margin of the large lake. It is extremely difficult to reach this lake, on account of its overflowing at short intervals, which does not allow the fluid mass time to cool. The nearest approach that any one of the party made to it at this time was about fifteen hundred or two thousand feet; they were then near enough to burn their shoes and light their sticks in the lava which had overflowed during the preceding night.

'The smaller lake was well viewed from a slight eminence. This lake was slightly in action; the globules (if large masses of red fluid lava, several tons in weight, can be so called) were seen heaving up at regular intervals, six or eight feet in height; and smaller ones were thrown up to a much greater elevation. At the distance of fifty feet, no gases were to be seen, nor was any steam evident, yet a thin smoke-like vapour arose from the whole fluid surface: no puffs of smoke were perceived at any time.

'At first, it seemed quite possible to pass over the congealed surface of the lake to within reach of the fluid, though the spot on which they stood was so hot as to require their sticks to be laid down to stand on. This idea was not long indulged in, for in a short time the fluid mass began to enlarge: presently a portion would crack, and exhibit a bright-red glare; then in a few moments the lava stream would issue through, and a portion would speedily split off, and suddenly disappear in the liquid mass. This kind of action went on until the lake had extended itself to its outer bank, and had approached to within fifteen feet of their position, when the guide said it was high time to make a retreat.'

The crater now described being, as already stated, on a shoulder of the hill, the summit or great dome impending over it remained to be scaled. The ascent was accordingly commenced on the 18th of December, and proved fully more fatiguing and hazardous than the previous part of the journey. As they ascended, every trace of vegetation disappeared; fierce blasts swept the mountain side; snow began to fall; and the thermometer went down successively to 25, 18, and 15 degrees. It stood at this, with a heavy fall of snow, when they reached the summit—13,760 feet above the level of the ocean. 'Nothing can exceed the devastation of the mountain: the whole area of it is one mass of lava, that has at one time been thrown out in a fluid state from its terminal crater. There is no sand or other rock; nothing but lava, on whichever side the eye is turned. To appearance, it is of different ages, some of very ancient date, though as yet not decomposed; and the alternations of heat and cold, with rain and snow, seem to have united in vain for its destruction.' Having attained the summit of the mountain, which exhibited all the traces of an extinct volcano, 'the sight was surpassingly grand. In the distance, the island of Maui emerged from and broke the line of the deep blue horizon, while its lower side was dimmed by a whitish haze, that seemed to unite it to the island of Hawaii. The same haze enveloped the hills of Kohala on our right, and the western extremity of Hawaii. Nearer to us was Hualalai, the third great mountain of Hawaii, up whose sides a compact mass of white fleecy clouds was impelled by the sea-breeze. To our right rose in bold relief Mauna Kea, covered with its snowy mantle; and at our feet was spread out, between the three great mountains, the black plain of lava, overhung by a dusky pall of clouds. All these features were so blended into each other by the mist, as to exhibit a tone of harmony that could hardly be conceived, considering the variety of the forms, characters, and distances of the objects, and which seemed to blend earth, sea, and sky into one. I can never hope again to witness so sublime a scene, to gaze on which excited such feelings, that I felt relieved when I turned from it to engage in the duties that had called me to the spot.'

Operations were now commenced for their survey. A rude enclosure of clinkers and scorias was built forty feet distant from the edge of the terminal crater; the tents were erected inside; and everything so disposed as to render tolerable a temperature varying in one day from 84 to 13 degrees. The attendants, most of whom had been left at various stations below, now brought the surveyors supplies of food and water, and thus they were enabled to prosecute their observations, and examine the phenomena of the terminal crater, without obstruction. This crater, or rather craters—for there are two, separated by a narrow partition of compact lava and clinkers—is an immense depression, with an elevated brim about twenty miles in circumference, which gradually narrows by successive ledges to the depth of eight or nine hundred feet. It has been dormant for many years, but is still filled with fissures and caverns, which emit steam and sulphureous vapours. Dr Judd, the sergeant, and Brooks, descended into the crater; they made the descent on the east bank among large blocks of lava, and reached the bottom in about an hour. There they were surrounded by huge clinkers and ridges, running generally north and south in lines across the crater; between these was the pahoehoi, or smooth lava. They passed over these obstructions to the south-west, and found in places many salts, among which were sulphate of soda and sulphate of lime. Four-fifths of the way across was a hill two hundred feet high, composed of scoria and pumice, with fissures emitting sulphurous acid gas. To the west was a plain full of cracks and fissures, all emitting more or less steam and gas. They found the west wall perpendicular; its lower strata were composed of a gray basalt. For three-fourths of the distance up it had a dingy yellow colour; above this there are a number of thin layers, apparently dipping to the south-west with the slope of the mountain. They also visited many steam cracks on the north-east side, from which fumes of sulphurous acid gas were emitted; no hydrogen was found in the gas, which extinguished flame without producing explosion.

On the 13th of January preparations were made for the descent, and this they accomplished by the same route, but with greater difficulty, as many of the men were worn out, their shoes gone, and not a few suffering severely from the mountain sickness. On their way they again halted at Kilauea, where Dr Judd, anxious to obtain some rare specimens of lava, as well as a vesselful of the molten matter, met with a very narrow escape. He had descended into a small detached crater thirty-eight feet deep by two hundred in diameter; smoke and a little igneous matter were issuing from a small cone in its centre; but with this exception, a crust of solid lava covered the bottom. While advancing downwards, he saw and heard a slight movement in the lava about fifty feet from him, which was twice repeated, and curiosity led him to turn to approach the place where the motion occurred. In an instant the crust was broken asunder by a terrific heave, and a jet of molten lava, full fifteen feet in diameter, rose to the height of about forty-five feet with a most appalling noise. He instantly turned, for the purpose of escaping, but found that he was now under a projecting ledge, which opposed his ascent, and that the place where he had descended was some feet distant. The heat was already too great to permit him to turn his face towards it, and was every moment increasing; while the violence of the throes, which shook the rock beneath his feet, augmented. Although he considered his life as lost, he did not omit the means for preserving it; but offering a mental prayer for the Divine aid, he strove, although in vain, to scale the projecting rock. While thus engaged, he called in English upon his native attendants for aid; and looking upwards, saw the friendly hand of Kalumo—who on this fearful occasion had not abandoned his spiritual guide and friend—extended towards him. Ere he could grasp it, the fiery jet again rose above their heads, and Kalumo shrunk back, scorched and terrified, until, excited by a second appeal, he again stretched forth his hand, and seizing Dr Judd's with a giant's grasp, their joint efforts placed him on the ledge. Another moment,

and all aid would have been unavailing to save Dr Judd from perishing in the fiery deluge.

After much breakneck and foolhardy adventure among the craters, steam fissures, and fumeroles of Kilauea, the party made their final descent, which was accomplished after an absence of forty-two days; 'and it was delightful,' adds the narrator, 'to feel ourselves as it were at home again, after so arduous and fatiguing an expedition.'

SIR WALTER SCOTT AND WILLIAM LAIDLAW.

CONCLUDING ARTICLE.

THE subsequent intercourse of Mr Laidlaw with the great minstrel may be traced with sufficient minuteness in Lockhart's *Life of Scott*. After some unsuccessful speculations and considerable losses, the 'gentle forerster' went to reside permanently at Abbotsford. He planned, carried out, or assisted in the rural improvements—superintended the planting or thinning of the woods (an occupation equally dear to Sir Walter), looked after the tenants and labourers—or, when the day was stormy or the season severe, joined the 'genius of the place' in his antique library or study, and occasionally wrote to his dictation. Latterly, when the evil days had come to Abbotsford, he was a constant amanuensis some hours every morning—the anxious novelist looking with eager and morbid haste towards the completion of his task, and watching each successive leaf as it was written and laid on the pile of paper. When his mind was entire, he threw off his images and conceptions with careless ease and facility. 'I never saw him much elated or excited in composition,' said Laidlaw; 'but one morning when he was out of doors concocting that simple but humorous song, Donald Caird. I watched him limping along at good five miles an hour, along the ridge or sky-line opposite Kaeside, and when he came in, he recited to me the fruits of his walk.' In dictating any part of his novels, he seemed not to attend to the expression, but to the continuity of his tale or dialogue. He had obviously arranged his plot and incidents for the day ere he descended from his bedroom, and the style he left to chance. His memory was an inexhaustible repertory, so that Hogg, in his moments of super-exaltation and vanity, used to say that, if he had the *shirra's* memory, he would beat him as a poet!

According to Mr Laidlaw, Scott did not like to speak about his novels after they were published, but was fond of canvassing the merits and peculiarities of the characters while he was engaged in the composition of the story. 'He was peculiarly anxious,' says Mr Laidlaw, 'respecting the success of Rebecca in Ivanhoe. One morning, as we were walking in the woods after our forenoon's labour, I expressed my admiration of the character, and, after a short pause, he broke out with—"Well, I think I shall make something of my Jewess." Latterly, he seemed to indulge in a retrospect of the useful effect of his labours. In one of these serious moods, I remarked that one circumstance of the highest interest might and ought to yield him very great satisfaction; namely, that his narratives were the best of all reading for young people. I had found that even his friend Miss Edgeworth had not such power in engaging attention. His novels had the power, beyond any other writings, of arousing the better passions and finer feelings, and the moral effect of all this, I added, when one looks forward to several generations—every one acting upon another—must be immense. I well recollect the place where we were walking at this time—on the road returning from the hill towards Abbotsford. Sir Walter was silent for a minute or two, but I observed his eyes filled with tears.'

Of all his contemporaries Scott spoke kindly and warmly: he seemed to be entirely free from literary jealousy. 'I had many conversations with him,' Laidlaw remarks, 'concerning the life and poetry of Byron, particularly after the date of a visit paid to Abbotsford by Lady Byron. He seemed to regret very much that Byron and he had not been thrown more together. He

felt the influence he had over his great contemporary's mind, and said there was so much in it that was very good and very elevated, that any one whom he much liked could, as he thought, have withdrawn him from many of his errors.'

The following note by Laidlaw is interesting both on account of the fact and the opinion it contains:— 'I have more than once (such was his modesty) heard Sir Walter assert that, had his father left him an estate of L.500 or L.600 a-year, he would have spent his time in miscellaneous reading, not writing. This, to a certain extent, might have been the case; and had he purchased the property of Broadmeadows, in Yarrow, as he at one time was very anxious to do, and when the neighbouring land was in the possession of independent proprietors, the effect might have been the same. At Abbotsford, surrounded by little lairds, most of them ready to sell their lands as soon as he had money to advance, the impulse to exertion was incessant; for the desire to possess and to add increased with every new acquisition, until it became a passion of no small power. Then came the hope to be a large landed proprietor, and to found a family.'

The correspondence between Sir Walter Scott and Mr Laidlaw was chiefly devoted to their rural concerns. When the poet was in Edinburgh attending to his official duties as clerk of session, he sighed for Abbotsford and the country, and took the liveliest interest in all that was going on under the superintendence of his friend. Passages like the following remind us of the writings of Gilpin and Price on forest and picturesque scenery:— 'George must stick in a few wild roses, honeysuckles, and sweet-briers, in suitable places, so as to produce the luxuriance we see in the woods which nature plants herself. We injure the effect of our plantings, so far as beauty is concerned, very much by neglecting under-wood.' 'I want to know how you are forming your glades of hard-wood. Try to make them come handsomely in contact with each other, which you can only do by looking at a distance on the spot, then and there shutting your eyes as you have done when a child looking at the fire, and forming an idea of the same landscape with glades of woodland crossing it. Get out of your ideas about expense. It is, after all, but throwing away the price of the planting. If I were to buy a picture worth L.500, nobody would wonder much. Now, if I choose to lay out L.100 or L.200 to make a landscape of my estate hereafter, and add so much more to its value, I certainly do not do a more foolish thing. I mention this, that you may not feel limited, so much as you might in other cases, by the exact attention to pounds, shillings, and pence, but consider the whole on a liberal scale. We are too apt to consider plantations as a subject of the closest economy, whereas beauty and taste have even a marketable value after the effects come to be visible. Don't dot the plantations with small patches of hard-wood, and always consider the ultimate effect.'

In the midst of his business details, Scott's peculiar humour and felicity of illustration are perpetually breaking out. His relation of the simplest occurrence is vivid and characteristic. A high wind in Edinburgh, in January 1818, he thus notices:— 'I had more than an anxious thought about you all during the gale of wind. The Gothic pinnacles were blown from the top of Bishop Sandford's Episcopal chapel at the end of Prince's Street, and broke through the roof and flooring, doing great damage. This was sticking the horns of the mitre into the belly of the church. The devil never so well deserved the title of Prince of the power of the air since he has blown down this handsome church, and left the ugly mass of new building standing on the North Bridge.'

We add a few more sentences:— 'Political publications must always be caricatures. As for the mob of great cities whom you accuse me of despising too much, I think it is impossible to err on that side. They are the very *riddings* of society, in which every useful cinder is, by various processes, withdrawn, and nothing

left but dust, ashes, and filth. Mind, I mean the mob of cities, not the lowest people in the country, who often, and indeed usually, have both character and intelligence.'

'I am made president of the Royal Society [1820], so I would have you in future respect my opinion in the matter of *chuckie-stanes*, caterpillars, fulminating powder, and all such wonderful works of nature. I feel the spirit coming on me, and never pass an old quarry without the desire to rake it like a cinder-sifter.'

Scott's opinion of modern Gothic architecture is thus incidentally announced. When in London in 1821, he writes— 'I have got a very good plan from Atkinson for my addition, but I do not like the outside, which is modern Gothic, a style I hold to be equally false and foolish. Blore and I have been at work to *Scottify* it, by turning battlements into bartisans, and so on. I think we have struck out a picturesque, appropriate, and entirely new line of architecture.'

Abbotsford must certainly be considered *picturesque*, but it is a somewhat incongruous pile, and without the beautiful garden-screen in front, the general effect would be heavy. Here is another scrap—

'DEAR WILLIE—I am glad to send you the *Maga* [Blackwood's Magazine], which continues to be clever. I hope for two or three happy days on the brae-sides about the birthday [4th of June]. Blackwood has been assaulted by a fellow who came from Glasgow on purpose, and returned second best. The bibliopole is like the little French lawyer, who never found out he could fight till he was put to it, and was then for cudgelling all and sundry. You never saw anything so whimsical. * * I think often, of course, about my walks, and I am sickening to descend into the glen at the little waterfall by steps. We could cut excellent ones out where the quarry has been. It is the only way we shall ever make what Tom Purdie calls a *neat job*, for a deep descent will be ugly, and difficult to keep. I would plant betwixt the stair and the cascade, so as to hide the latter till you came down to the bottom.'

The employment of the people about Abbotsford seems to have engaged much of Sir Walter's attention, and on such subjects his views were patriotic and enlightened. In a letter dated December 1819, he says— 'Above all, I would employ the people in draining wherever it is necessary, or may be improved. In this way many hands may be employed, and to the permanent advantage of the property. Why not drain the sheep-walk to purpose? As it is my intention to buy no books, and avoid all avoidable expenses, I hope to be able to spare L.100 or so extraordinary for my neighbours. I should be sorry that any of them thought I did this from either doubting them or fearing them. I have always consulted their interest in gratifying my own humour, and if they could find many a wiser master, they would scarce find any one more for their purpose.'

The same year (which was a period of some excitement and discontent) he writes again to Laidlaw— 'I am glad you have got some provision for the poor. They are the minors of the state, and especially to be looked after; and I believe the best way to prevent discontent is to keep their minds moderately easy as to their own provision. The sensible part of them may probably have judgment enough to see that they could get nothing much better for their class in general by an appeal to force, by which, indeed, if successful, ambitious individuals might rise to distinction, but which would, after much misery, leave the body of the people just where it found them, or rather much worse.'

This considerate benevolence and liberality produced the expected reward. The labouring classes on the estate of Abbotsford and its neighbourhood were strongly attached to their illustrious master. At a later period, when the excitement of the Reform Bill penetrated even the most remote and quiet districts, Scott's popularity appeared to be partially shaded; but it was only a momentary cloud, and it occurred chiefly

with the town population, not with the rural classes. In March 1831, he was present at a meeting of the freeholders of Roxburgh, held at Jedburgh, to pass resolutions against the Reform Bill. He was dragged to the meeting by the young Duke of Buccleuch and Mr Henry Scott of Harden, contrary to his prior resolution, and his promise to Miss Scott; for his health was then much shattered. 'He made a confused imaginative speech,' says Laidlaw, 'which was full of evil forebodings and mistaken views. The people who were auditors, in proportion to their love and reverence for him, felt disappointed and sore, and, like himself, were carried away by their temporary chagrin, to the great regret of the country around. The same people a few weeks afterwards, when Mr Oliver, the sheriff of Roxburgh, was foolishly swearing in constables at Melrose, said boldly, they need not bring them to fight against reform, for they would fight for it, but if any one meddled with Sir Walter Scott, they would fight for him.'

On all such subjects Scott and Laidlaw had frequent arguments, for the latter, as Lockhart says, was always a stout Whig. Sir Walter acknowledged to Hogg that he never found a mind so inexhaustible as Laidlaw's, for he had always something new to communicate, either in the way of speculation, information, or experiment.

The great crash in 1825-26, which involved the pecuniary ruin of Sir Walter, led to the breaking up of his establishment, and the derangement of all his plans. He announces the stunning event in an affecting letter to Mr Laidlaw, from which we extract a few passages:—
'For you, my dear friend, we must part—that is, as laird and factor—and it rejoices me to think that your patience and endurance, which set me so good an example, are like to bring round better days. You never flattered my prosperity, and in my adversity, it is not the least painful consideration that I cannot any longer be useful to you. But Kaeside, I hope, will still be your residence, and I will have the advantage of your company and advice, and probably your services as amanuensis. Observe, I am not in indigence, though no longer in affluence, and if I am to exert myself in the common behalf, I must have honourable and easy means of life, although it will be my inclination to observe the most strict privacy, the better to save expense, and also time. Lady Scott's spirits were affected at first, but she is getting better. *For myself, I feel like the Eildon Hills—quite firm, though a little cloudy. I do not dislike the path which lies before me. I have seen all that society can show, and enjoyed all that wealth can give me, and I am satisfied much is vanity, if not vexation of spirit. What can I say more? except that I will write to you the instant I know what is to be done. In the meantime, it is only necessary to say I am arranging my affairs, and mean to economise a good deal, and that I will pay every man his due.*'

The following brief and pleasant note, without date, must be referred to 1827, as it was in June of that year that the *Life of Napoleon* was published:—

'MY DEAR MR LAIDLAW—I would be happy if you would come down at *half-time* to-day. Napoleon (6000 copies) is sold for £11,000!!! Yours truly, W. S.'

'Sunday.'

Mr Laidlaw at length removed from Kaeside, and Scott felt sorely the want of his habitual counsel and society. Under the date of August 1827, he writes in the following affectionate strain:—'Your leaving Kaeside makes a most melancholy blank to us. You, Mrs Laidlaw, and the bairns, were objects we met with so much pleasure, that it is painful to think of strangers being there. But they do not deserve good weather who cannot endure the bad, and so I would "set a stout heart to a stay [steep] brae;" yet I think the loss of our walks, plans, discussions, and debates, does not make the least privation that I experience from the loss of world's gear. But, *sursum corda*, and we shall have many happy days yet, and spend some of

them together. I expect Walter and Jane, and then our long-separated family will be all together in peace and happiness. I hope Mrs Laidlaw and you will come down and spend a few days with us, and revisit your old haunts. I miss you terribly at this moment, being engaged in writing a planting article for the Quarterly, and not having patience to make some necessary calculations.'

Mr Laidlaw has written on the back of the communication—'This letter lies in the drawer in which the unfinished manuscript of *Waverley* was found, amongst fishing-tackle, &c. which yet remain. I got the deak as a present from Sir Walter.'

In 1830, a re-union took place. Mr Laidlaw took up his abode again at Kaeside, and remained in daily intercourse with Sir Walter till the time of his death. The record of those sad and painful days in Lockhart's *Life* is deeply interesting. Never was there a more affecting narrative; nor could there be a more instructive or ennobling example than Scott presented in his period of suffering and adversity. We will not attempt to lift the curtain again on this tragic scene, which saddened all Europe.

A trouble, not of clouds, or weeping rain,
Nor of the setting sun's pathetic light

Engendered, hangs o'er Eildon's triple height!
—Wordsworth.

Mr Laidlaw cherished with religious care all his memorials of Abbotsford, where, indeed, his heart may be said to have remained till its last pulsation. The desk in which the first manuscript of *Waverley* was deposited [see the introduction to the novel] stood in his room; the works inscribed and presented by the author were carefully ranged on his shelves; the letters he had received from him were treasured up; the pens with which *Ivanhoe* was written were laid past, and kept as a sacred thing; but, above all, he valued a brooch which was round the neck of Scott when he died. This ornament had been presented to Sir Walter Scott by his son, the present Sir Walter, and his wife (inscribed 'From Walter and Jane'), on the day of their marriage, and it contained some of the hair of each. When the grave had closed over the illustrious minstrel, his children gave the invaluable jewel to their own and their father's friend, accompanying the gift with some of the hair of Scott, which was also placed in the brooch—the white locks of age with the dark tresses of youth. Mr Laidlaw wore the brooch while a trace of sensibility remained, and it has descended to another generation—one of the most precious of the personal *reliquiæ* of a splendid but melancholy friendship.

THE LOCKSMITH OF PHILADELPHIA.

A STORY.*

SOME years ago, in the city of Philadelphia, there lived an ingenious locksmith named Amos Sparks. Skilled as a maker and repairer of locks, he was particularly celebrated for his dexterity in opening them, when it was necessary to do so in cases of emergency. Like many men of talent in other departments, Amos Sparks was poor. Though a very industrious and prudent man, with a small and frugal family, he merely obtained a comfortable subsistence, but he never seemed to accumulate property. Whether it was that he was not of the race of money makers, whose instinctive desire of accumulation forces them to earn and hoard without a thought beyond the mere means of acquisition—or whether the time occupied by the prosecution of new inquiries into still undiscovered regions of his favourite pursuit, and in conversation with those who came to inspect and admire the fruits of his ingenuity, were the cause of his poverty, we cannot undertake to determine—but perhaps various causes combined to keep his finances low;

* We have abridged this story from a tale in an American newspaper, which we regret does not give the name of the writer.

and it was quite as notorious in the city that Amos Sparks was a poor man, as that he was an ingenious mechanic. But his business was sufficient for the supply of his wants and those of his family, and so he studied and worked on, and was content.

It happened that, in the autumn of 18—, a merchant in the city, whose business was extensive, and who had been bustling about the quay and on board his vessels all the morning, returned to his counting-house to lodge several thousand dollars in the Philadelphia bank, to renew some paper falling due that day; when, to his surprise, he had either lost or mislaid the key of his iron chest. After diligent search, with no success, he was led to conclude that, in drawing out his handkerchief, he had dropped the key in the street, or perhaps into the dock. What was to be done? It was one o'clock—the bank closed at three, and there was no time to advertise the key, or to muster so large a sum of money as that required. In his perplexity the merchant thought of the poor locksmith. He had often heard of Amos Sparks; the case seemed one particularly adapted to a trial of his powers—and being a desperate one, if he could not furnish a remedy, where else were there reasonable expectations of succour? A clerk was hurried off for Amos, and having explained the difficulty, speedily reappeared, followed by the locksmith with his implements in his hand.

The job proved more difficult than had been anticipated, and, fearful of losing credit by the delay, the merchant offered five dollars' reward to Amos if he would open the chest in as many minutes. Amos succeeded. The lock was picked, and the chest flew open. There the merchant's treasures lay, but they were not yet in his possession. As he enjoyed but a poor reputation for uprightness of dealing, Amos could not trust to his promise of payment. Holding the lid in his hand, he respectfully requested the sum which had been offered; and, as he had expected, it was refused. A much less sum was meanly proposed in its stead, on the plea that it was surely sufficient for a few minutes' work. Amos was indignant and inexorable. The merchant shuffled and fumed. In an instant down went the lid of the chest, and, fastening by a spring, it was again locked as securely as before.

The merchant looked aghast at Amos, and then darted a glance at the clock: the hand pointed to within twenty minutes of three, and seemed posting over the figures with the speed of light. What was to be done? At first he tried to bully, but it would not do. Amos told him, if he had sustained any injury, 'he might sue as soon as he pleased, for that his time was too precious just now to be wasted in trifling affairs'; and, with a face of unflinching composure, he turned on his heel and was leaving the office.

The merchant called him back—he had no alternative—his credit was at stake—he was humbled by the necessity of the case; and handing forth the five dollars, 'There, Sparks,' said he, 'take your money, and let us have no more words.'

'I must have ten dollars now,' replied the locksmith. 'You would have taken advantage of a poor man; and, besides opening your strong box there, I have a lesson to offer which is well worth a trifling sum. You would not only have deprived me of what had been fairly earned, but have tempted me into a lawsuit which would have ruined my family. You will never in future presume upon your wealth in your dealings with the poor, without thinking of the locksmith, and those five dollars may save you much sin and much repentance.'

This homily, besides being preached in a tone of calm determination, which left no room to hope for any abatement, had exhausted another minute or two of the time already so precious. The merchant hurriedly counted out the ten dollars, which Amos deliberately inspected, to see that they belonged to no insolvent bank, and then deposited them in his pocket. Having thus made quite sure of his reward, he dexterously opened the lock, and

placed the merchant in possession of his property, in time to save his credit at the bank.

About a month after this affair, the Philadelphia bank was robbed of coin and notes to the amount of fifty thousand dollars. The bars of a window had been cut, and the vault entered so ingeniously, that it was evident the burglar had possessed, besides daring courage, a good deal of mechanical skill. The police scoured the city and country round about, but no clue to the discovery of the robbery could be traced. The public mind was powerfully excited. Everybody who had anything to lose, felt that daring and ingenious felons were abroad, who might probably pay them a visit; all were therefore interested in the discovery and the conviction of the perpetrator of so daring a deed. Suspicions at length began to settle on Sparks; but yet his poverty and known integrity seemed to give them the lie. The story of the iron chest, which the merchant had hitherto been ashamed, and Amos too forgiving, to tell—for the latter did not care to set the town laughing at the man who had wronged him—now began to be told. The merchant, influenced by a vindictive spirit, had whispered it to the directors of the bank, with sundry shrugs and innuendos; and of course it soon spread far and wide, with all sorts of exaggerated variations and additions. Amos thought for several days that some of his neighbours looked and acted rather oddly, and he missed one or two who used to drop in and chat almost every afternoon; but not suspecting for a moment that there was any cause for altered behaviour, these matters made but a slight impression on his mind. In all such cases, the person most interested is the last to hear disagreeable news; and the first hint that the locksmith got of the universal suspicion was from the officer of the police, who came with a party of constables to search his premises. Astonishment and grief were the portion of Amos and his family for that day. The first shock to a household who had derived, even amidst their humble poverty, much satisfaction from the possession of a good name—a property they had been taught to value above all earthly treasures—may be easily conceived. To have defrauded a neighbour of sixpence would have been a meanness no one of them would have been guilty of; but Fifty Thousand Dollars!—the immensity of the sum seemed to clothe the suspicion with a weight of terror that nearly pressed them to the earth. They clung to each other, with bruised and fettered spirits, while the search was proceeding, and it was not until it was completed, and the officer declared himself satisfied that there was none of the missing property on the premises, that they began to rally, and looked calmly at the circumstances which seemed for the moment to menace the peace and security they had hitherto enjoyed.

'Cheer up, my darlings,' said Amos, who was the first to recover the sobriety of thought that usually characterised him—'cheer up—all will yet be well; it is impossible that the unjust suspicion can long hover about us. A life of honesty and fair-dealing will not be without its reward. There was perhaps something in my trade, and the skill which long practice had given me in it, that naturally enough led the credulous, the thoughtless, and perhaps the mischievous, if any such there be connected with this inquiry, to look towards us. But the real authors of this outrage will probably be discovered soon, for a fraud so extensive will make all parties vigilant; and if not, why, then, when our neighbours see us toiling at our usual occupations, with no evidences of secret wealth, or lavish expenditure, on our persons or at our board, and remember how many years we have been so occupied and so attired, without a suspicion of wrongdoing even in small matters attached to us, there will be good sense and good feeling enough in the city to do us justice.'

There was sound sense and much consolation in this reasoning: the obvious probabilities of the case were in favour of the fulfilment of the locksmith's expectations. But a scene of trial and excitement—of prolonged agony and hope deferred—lay before him, the extent of which

it would have been difficult, if not impossible, for him then to have foreseen. Foiled in the search, the directors of the bank sent one of their body to negotiate with Amos—to offer him a large sum of money, and a guarantee from further molestation, if he would confess, restore the property, and give up his accomplices, if any there were. It was in vain that he protested his innocence, and avowed his abhorrence of the crime. The banker rallied him on his assumed composure, and threatened him with consequences; until the locksmith, who had been unaccustomed to dialogues founded on the presumption that he was a villain, ordered his tormentor out of his shop, with the spirit of a man who, though poor, was resolved to preserve his self-respect, and protect the sanctity of his dwelling from impertinent and insulting intrusion.

The banker retired, baffled, and threatening vengeance. A consultation was held, and it was finally determined to arrest Sparks and commit him to prison, in the hope that, by shutting him up, and separating him from his family and accomplices, he would be less upon his guard against the collection of evidence necessary to a conviction, and perhaps be frightened into terms, or induced to make a full confession. This was a severe blow to his family. They would have borne much together—for mutual counsel and sympathy can soothe many of the ills of life; but to be divided—to have the strongest mind, around which the feeble ones had been accustomed to cling, carried away captive, to brood in solitary confinement, on an unjust accusation, was almost too much, when coupled with the cloud of suspicion that seemed to gather around their home, and infect the very air they breathed. The privations forced upon them by the want of the locksmith's earnings were borne without a murmur; and out of the little that could be mustered, a portion was always reserved to buy some trifling but unexpected comfort or luxury to carry to the prisoner.

Some months having passed without Sparks having made any confession, or the discovery of any new fact whereby his guilt might be established, his prosecutors found themselves reluctantly compelled to bring him to trial. They had not a tittle of evidence, except some strange locks and implements found in the shop, and which proved the talent, but not the guilt, of the mechanic. But these were so various, and executed with such elaborate art, and such an evident expenditure of labour, that but few even of the judges, jury, or spectators, could be persuaded that a man so poor would have devoted himself so sedulously to such an employment, unless he had had some other object in view than mere instruction or amusement. His friends and neighbours gave him an excellent character; but on their cross examination, all admitted his entire devotion to his favourite pursuit. The counsel for the banker exerted himself with considerable ability. Calculating in some degree on the state of the public mind, and upon the influence which vague rumours, coupled with the evidences of the mechanic's handicraft exhibited in court, might have on the mind of the jury, he dwelt upon every ward and winding—on the story of the iron chest—on the evident poverty of the locksmith, and yet his apparent waste of time—and asked if all this work were not intended to insure success in some vast design? He believed that a verdict would be immediately followed by a confession, for he thought Amos guilty, and succeeded in making the belief pretty general among his audience. Some of the jury were half inclined to speculate on the probabilities of a confession, and, swept away by the current of suspicion, were not indisposed to convict without evidence, in order that the result might do credit to their penetration; but this was impossible, even in an American court of justice, in the good old times of which we write. Hanging persons on suspicion, and acquitting felons because the mob think murder no crime, are modern inventions. The charge of the judge was clear and decisive. He admitted that there were grounds of suspicion—that there were circumstances connected with the prisoner's peculiar mode of life that were not reconcil-

able with the lowness of his finances; but yet of direct testimony there was not a vestige, and of circumstantial evidence there were not only links wanting in the chain, but, in fact, there was not a single link extending beyond the locksmith's dwelling. Sparks was accordingly acquitted; but as no other clue was found to direct suspicion, it still lay upon him like a cloud. The vindictive merchant and the dissatisfied bankers did not hesitate to declare, that although the charge could not be legally brought home, they had no doubt whatever of his guilt. This opinion was taken up and reiterated, until thousands, who were too careless to investigate the story, were satisfied that Amos Sparks was a rogue. How should the character of a poor man hold out against the deliberate slanders of so many rich ones?

Amos rejoiced in his acquittal, as one who felt that the jury had performed a solemn duty faithfully, and who was glad to find that his present experience had strengthened rather than impaired his reliance on the tribunals of his country. He embraced his family as one snatched from great responsibility and peril; and his heart overflowed with thankfulness when at night they were all once more assembled round the fireside, the scene of so much happiness and amity in other days. But yet Amos felt that, though acquitted by the jury, he was not by the town: he saw that in the faces of some of the jury, and most of the audience, which he was too shrewd an observer to misunderstand. He wished it were otherwise; but he was contented to take his chance of some subsequent revelation; and if it came not, of living down the foul suspicion.

But Amos had never thought of how he was to live. The cold looks, averted faces, and rude scandal of the neighbours, could be borne, because really there was some excuse in the circumstances, and because he hoped that there would be a joyful ending of it all at some future day. But the loss of custom first opened his eyes to his real situation. No work came to his shop; he made articles, but he could not sell them; and as the little money he had saved was necessarily exhausted in the unavoidable expense of the trial, the family found it impossible, aided by the utmost exertion and economy, to meet their current outlay. One article of furniture after another was reluctantly sacrificed, or some little comfort abridged, until, at the end of months of degradation and absolute distress, their bare board was spread within bare walls, and it became necessary to beg, to starve, or to remove. The latter expedient had often been suggested in family consultations, and it is one that in America is the common remedy for all great calamities. The Sparkses would have removed, but they still clung to the hope that the real perpetrator would be discovered, and the mystery cleared up; and, besides, they thought it would be an acknowledgment of the justice of the general suspicion if they turned their backs and fled. They lived upon the expectation of the renewed confidence and companionship of old friends and neighbours, when Providence should deem it right to draw the veil aside. At length, to live longer in Philadelphia became impossible, and the whole family prepared to depart. Their effects were easily transported, and as they had had no credit since the arrest, there was nobody to prevent them from seeking a livelihood elsewhere.

Embarking in one of the river boats, they pushed up the Schuylkill, and settled at Norristown. The whole family being industrious and obliging, they soon began to gather little comforts around them; and as these were not embittered by the cold looks and insulting sneers of the neighbourhood, they were comparatively happy for a time. But even here there was for them no permanent place of rest. A traveller passing through Norristown, on his way from the capital to the Blue Mountains, recognised Sparks, and told somebody he knew that he wished the community joy of having added to the number of its inhabitants the notorious locksmith of Philadelphia. The news soon spread. The family found that they were shunned as they had formerly

been by those who had known them longer than the good people of Norristown, and had a fair prospect of starvation opening before them. They removed again. This time there was no inducement to linger, for they had no local attachments to detain them. They crossed the mountains, and, descending into the vale of the Susquehanna, pitched their tent at Sunbury. Here the same temporary success excited the same hopes, only to be blighted in the bud by the breath of slander, which seemed so widely circulated as to leave them hardly any asylum within the limits of the State. We need not enumerate the different towns and villages in which they essayed to gain a livelihood, and failed. They had nearly crossed the State in its whole length, been driven from Pittsburg, and were slowly wending their way further west, and were standing on the high ground overlooking Middleton, as though doubtful if there was to be rest for the soles of their feet even there. They hesitated to try a new experiment. Sparks seated himself on a stone beneath a spreading sycamore—his family clustered around him on the grass: they had travelled far, and were weary, and, without speaking a word as their eyes met, and thinking of their prolonged sufferings and slender hopes, they burst into a flood of tears, in which Sparks, burying his face in the golden locks of the sweet girl who bowed her head upon his knee, joined audibly. At length, wiping away his tears, and checking the rising sobs that shook his manly bosom—'God's will be done, my children,' said the locksmith; 'we cannot help weeping, but let us not murmur. If we are to be wanderers and fugitives on the earth, let us never lose sight of the promise which assures us of an eternal refuge in a place where the wicked cease from troubling and the weary are at rest. I was perhaps too proud of that skill of mine—too apt to plume myself upon it, above others whose gifts had been less abundant. My error has been that of wiser and greater men, who have been made to feel that what we cherish as the means of obtaining earthly blessings, sometimes turns out a curse.'

To dissipate the gloom which hung over the whole party, and beguile the half hour they intended to rest in that sweet spot, Mrs Sparks drew out a Philadelphia newspaper which somebody had given her upon the road, and called their attention to the deaths and marriages, that they might see what changes were taking place in a city that still interested them, though they were banished for ever from its borders. She had hardly opened the paper when her eye glanced on an article which she was too much excited to read. Amos, wondering at the emotion displayed, gently disengaged the paper, and read—'Bank robber—Sparks not the man.' His own feelings were as powerfully interested as those of his wife, but his nerves were stronger; and he read out, to an audience whose ears devoured every syllable of the glad tidings, an account of the conviction and execution of a wretch in Albany, and who had confessed, among other daring and heinous crimes, the robbery of the Philadelphia bank, accounting for the disappearance of the property, and exonerating Sparks, whose face he had never seen. These were tidings of great joy to the weary wayfarers beneath the sycamore, whose hearts overflowed with thankfulness to the Father of mercy, who had given them strength to bear the burden of affliction, and had lifted it from their spirits ere they had been crushed beneath its weight. Their resolution to return to their native city was formed at once, and before a week had passed, they were slowly journeying to the capital of the State.

Meanwhile, an extraordinary revulsion of feeling had taken place at Philadelphia. Newspapers and other periodicals which had formerly been loud in condemnation of the locksmith, now blazoned abroad the robber's confession—wondered how any man could have been for a moment suspected upon such evidence as was adduced on the trial—drew pictures of the domestic felicity once enjoyed by the Sparkses, and then painted—partly from what was known of the reality, and partly

from imagination—their sufferings, privations, and wrongs in the pilgrimage they had performed in fleeing from an unjust but damnable accusation. The whole city rang with the story. Old friends and neighbours, who had been the first to shun them, now became the loud and vehement partisans of the family. The whole city was anxious to know where they were. Some reported that they had perished in the woods; others that they had been burnt in a prairie, which not a few believed; while another class averred that the locksmith, driven to desperation, had first destroyed his family, and then himself. All these stories of course created as much excitement as the robbery of the bank had done before, only that this time the tide set the other way; and when the poor locksmith and his family, who had been driven like vagabonds from the city, approached its suburbs, they were met, congratulated, and followed by thousands: in fact, theirs was almost a triumphal entry. And as the public always like to have a victim, Sparks was advised on all hands to bring an action against the directors of the bank: large damages would, they knew, be given, and the banker deserved to suffer for the causeless ruin brought on a poor but industrious family.

Sparks was reluctant to engage in any such proceeding. His character was vindicated, his business restored. He occupied his own shop, and his family were comfortable and content. But the current of public opinion was too strong for him. All Philadelphia had determined that the banker should suffer. An eminent lawyer volunteered to conduct the suit, and make no charge if a liberal verdict were not obtained. The locksmith pondered the matter well. His own wrongs he freely forgave, but he thought that there had been a readiness to secure the interests of a wealthy corporation by blasting the prospects of a humble mechanic, which, for the good of society, ought not to pass unrebuked. He felt that the moral effect of such a prosecution would be salutary, teaching the rich not to presume too far upon their affluence, and cheering the hearts of the poor while suffering unmerited persecution. The suit was commenced, and urged to trial, notwithstanding several attempts at compromise on the part of the banker. The pleadings on both sides were able and ingenious; but the counsel for the plaintiff had a theme worthy of the fine powers he possessed. At the close of a pathetic and powerful declamation, the audience, who had formerly condemned Amos in their hearts without evidence, were melted to tears by the recital of his sufferings; and when the jury returned with a verdict of ten thousand dollars damages against the banker, the locksmith was honoured by a ride home on their shoulders amidst a hurricane of cheers.

A VISIT TO THE GREAT BRITAIN.

ONE fine morning lately, as hinted at in a previous article, we set out to inspect the largest steam-ship which is at present afloat. She lay off Blackwall in the Thames, near London, and, by the liberality of her proprietors, the 'Great Western Steam Navigation Company,' as well as by the admirable arrangements of the managers of the Blackwall railway, the trip proved both easy of accomplishment and inexpensive. After a ten minutes' ride from Fenchurch Street, we were safely deposited on the Blackwall pier, to await the arrival of a miniature steamer which plied between the shore and the immense ship.

To those previously informed that the Great Britain is one-third larger than a first-rate ship of war, and that she carries six masts, the first view of her from a distance is generally—in reference to her magnitude—disappointing. It is not till the bows are passed, and the eye travels from one end to the other, that the vast dimensions of the Great Britain are understood. This line, though long, being very slightly bent near the head, and again at the stern, is graceful and

elegant, not being interrupted by those hideous accompaniments to other steamers—paddle-boxes. Rowing beside her in a small boat, the distance from the fore to the after part of the ship may be likened to a short voyage. Under the rear part of the vessel, the chief novelty presents itself—which is the propeller. This is placed under the stern, between the stern post and the 'run' of the ship, and consists of a screw with six blades of solid iron, triangular in shape, fastened to a revolving shaft. Again the idea of smallness presents itself: the blades which appear above water seem quite diminutive, when it is considered what an immense mass they have to propel. The entire screw is only 15 feet 6 inches in diameter; yet, by its rapid revolutions, it has to drive forward a ship 322 feet long and 51 broad—a floating mass, in fact, equal to some 3450 tons, even when unencumbered with a cargo—and at the rate of 12 miles an hour. Viewed with reference to this enormous power, the screw appears like a mere toy.

Having glanced at the outside of the Great Britain, we ascended her side, and stood on her deck. The impressions of fragility and lightness were strengthened: the masts, even when close to them, appeared slender to insecurity; the rigging light; the bulwarks low and thin. As there is nothing to excite surprise so much as this general variance of the appearance of the actual ship with the preconceived ideas of its size and strength, it will be here necessary to explain whence this difference arises. The truth is, that, except the flooring and ornamental parts of the decks and cabins, the Great Britain is built of iron. After many experiments (for no previous experience existed to guide them), the Great Western Steam Company concluded that iron would afford greater strength, greater buoyancy, and more capacity, at less expense, than wood. The sides—formed of massive ribs varying from 14 to 21 inches apart—are lined within and covered without with plate iron five-eighths of an inch thick, so that the greater part of the sides is hollow. The bottom and keel are of solid iron, one inch thick, exclusive of the ribs. Even the rigging is of iron, for it is made of twisted wire. The quantity of metal used in the construction of the hull was 1400 tons. Now, it is easy to understand that the same number of tons' weight of the strongest wood would occupy infinitely more space, without affording additional strength: it is the closer disposition of materials about the ship which has given her the light, rakish appearance which first strikes the eye of an observer.

Of the length of the ship, the most complete *coup-d'œil* is to be obtained by walking to the after part of the deck, and thence looking straight a-head to the prow. The deck appears like two long narrow streets divided by the funnel, the six masts, the hatches, &c. which rise between them, to form one side; the bulwarks being the other. Along these two thoroughfares there is nothing to interrupt the smoothness of the wood-pavement; for the deck is what is called a 'flush' deck; that is to say, an even one, with no poop or other erection to alter its level, except at the fore-castle, where there is a small break. The length of these two vistas bears so great a disproportion to their width, that the mind abandons calculation by means of feet and yards, and thinks of a mile. The actual length of this monster deck is, in fact, within a fraction of the sixteenth of a mile.

Having sufficiently examined and wondered at what was to be seen upon the upper deck, we descended to that below. This is divided into two parts by the space occupied by the cook-houses and machinery. It consists of two vast 'promenade saloons,' flanked by sleeping berths and state-rooms. The after-saloon was that which we first visited. It is elegantly fitted up and ornamented with coloured scrolls and flowers, to a degree which a man of severe taste would designate as finical. On each side of the promenade is a row of five doors, leading into the sleeping places; of which

four are led to by every door, being divided by a short passage. The first door on each side of the saloon conducts to a 'ladies' boudoir,' whilst the fifth at either end opens into state or private rooms—of which there are eight—calculated for families. The sternmost part of the promenade is fitted up with sofas. The captain's cabin is a-midships, between the two companion stairs, which lead from the upper deck. Descending into the deck below, the counterpart of what had just been seen presented itself. This lower promenade is to be used as a dining-room; and, for the ladies' boudoirs, a steward's pantry and store-rooms are substituted. The number of sleeping berths is also greater, because there are no state-rooms. In the passage to the fore part of the vessel are, on one side, baths, lavatories, and other conveniences; and, on the other, the kitchen. This is most completely fitted with every conceivable apparatus for roasting, boiling, frying, grilling, and stewing; shadowing forth to all who can on a sea voyage enjoy them, a series of excellent and tempting dinners. At the end of the passage, the 'forward promenade saloon' is entered. Except in the shape, we saw nothing in the plan of this different from that of the after-saloon. It is of course much shorter, by reason of the sudden narrowing of the ship where the prow is formed. Where this narrowing begins, there is a partition, behind which are arranged the proper accommodations for the officers of the vessel. The saloon below is, like that 'aft' on the same level, the counterpart of the upper storey in general appearance, the partitioned part in the fore-castle affording berths for the common sailors.

No one, after viewing these four saloons, but must be struck with the extent and completeness of accommodation which the Great Britain affords. Comfortable beds and berths are provided for as many as 360 passengers, without making up a single sofa.

Thus much of the passenger portion of the vessel; now for the locomotive department. Ascending to the upper deck, the spectator has to dive into the hot and black engine department by its own special entrance, composed of iron ladders. The bewildering mass of machinery which meets the view—bewildering rather from its vastness than from its complexity—is so distributed in the vessel as to form permanent ballast; and the middle of the ship has not to bear all its weight, as is the case in vessels with side paddles. It has to perform one very simple duty, which is to turn the screw we have already described, at the stern, with sufficient velocity to propel the ship. To effect this, four engines—the united power of which equals that of 1000 horses—are employed. Their action upon the machinery is readily understood. There is an enormous wheel or 'drum,' 18 feet in diameter, working on an axis or spindle. To either end of the spindle is attached an immense crank moved by one pair of engines, the other pair driving the crank at the opposite end of the axis; so that the whole four expend their force upon the gigantic drum to whirl it round. The duty of this large wheel is to cause a band composed of four iron chains to revolve with it; that, in the regions below, they may pass round and turn another and smaller wheel. Of course the chains make this little wheel revolve as much oftener as it is smaller than the *grosse caisse* or big drum; an operation they perform—a singularity in such cases—without the slightest noise. The great fault of the 'Archimedes,' in which vessel the principle adopted in the Great Britain was first tried, was the intolerable noise made by the machinery that conveyed motion to the screw. The engineers of the monster ship have obviated this objection by having each link of their chains supplied with a tooth, which juts into grooves made in both wheels, so as to 'bite' them as they pass round. Though weighing seven tons, therefore, the chains work quite silently. The little wheel below has for its axis one end of a long horizontal shaft, to the other extremity of which is attached the propeller, which we had previously seen outside at the stern, and which is made to revolve as

fast as the little wheel in the water. Here is the whole secret of propulsion in the Great Britain.

The iron shaft which communicates motion to the propeller is not the least curious part of the machinery; on account of the distance of the steam power from the stern, it is 130 feet long. Each end is of solid iron—that at the smaller wheel next the engines being 28 feet in length, with a diameter of 16 inches; that to which the propeller is fastened being of the same diameter, but only 25½ feet long. The intermediate part of the shaft is hollow, 2 feet 8 inches in diameter, and 68 feet long; and this makes up the entire longitude of 130 feet. Although so much of the shaft is hollow, it weighs 38 tons.

The immense velocity with which the shaft is made to turn in order to propel the vessel, would heat it to a dangerous degree, were not means of continual cooling employed. This is effected by numerous holes in the side of the hull, through which water is constantly poured upon and within the hollow part of the shaft. It has been calculated by actual experiment that, on an average, for every three times the engine revolves in a minute, the ship will be driven through the water 2 miles in an hour. Thus 12 revolutions per minute propels her 8 miles an hour. The rate at which the vessel is intended to work her way across the Atlantic is 12 miles per hour, which will require her engines to make 18 revolutions every minute.

Having inspected as much of the machinery as we were able to see, we were preparing to ascend, when the sound of blacksmiths' hammers induced us to look through the iron grating on which we stood. A lower abyss was revealed to us by the lurid glare of a forge fire. It was the blacksmith's shop. An iron ship is of course obliged to carry blacksmiths instead of carpenters. Not having either curiosity or courage to descend, we regained the upper deck.

The leading peculiarity of the Great Britain is her great size. On this subject much has been said both *pro* and *con*. Looking at her in a nautical and scientific point of view, it is an important advantage, for reasons which are not very generally understood. It has been ascertained from past experience, that the tonnage or power of carrying cargo increases in a triple ratio with increase of size; whilst the requisite power and fuel augments only in a twofold ratio to the increase of dimension.* On this account, we find that though the ship contains nearly 800 tons' weight of machinery, with stowage for 1200 tons of coal, and 200 tons of water (in the boilers), yet she is capable of carrying 1000 tons besides of cargo, independent of passengers. On the other hand, looking at the Great Britain in a commercial point of view, much doubt exists as to whether a sufficient number of passengers, and a sufficient quantity of goods, can be collected to make her rapid voyages to New York profitable. It is well known that the British Queen failed from want of patronage in these respects. Whether the Great Britain will prove a profitable vessel to her owners, time can only determine. We sincerely hope she may.

As regards safety, every precaution has been employed in constructing the Great Britain. She is built in distinct compartments, each water-tight, and independent of the other. All steamers, whether on the score of humanity or for the preservation of property, ought to be so built; for if a vessel be divided into five or six compartments, and any one of them should from accident fill, her buoyancy would only be slightly affected. If two compartments fill, and these two were not at the extremes, the other compartments would still keep her afloat. If two consecutive compartments, either forward or aft, fill, it is certain that, were she to go down head or stern foremost, she would be some time about it; long enough, probably, to allow of all the boats being got in readiness. The Great Britain is provided, in case of such an emergency, with

four large life-boats of iron, and two boats of wood, which are suspended from davits over the side of the ship, whilst one large life-boat is kept on the deck. The whole are capable of carrying 400 persons: though by far the most effectual precaution is the system of independent compartments. As a proof of its efficacy, we may instance the case of the *Nemesia*, which struck some time ago on the English Stones in the Bristol Channel, going nine or ten knots an hour: she slid off, after making such a slit as filled the forward compartment. She steamed several hours with the compartment full, until she obtained additional pumps in Mount's Bay, with which the space was pumped out, and the leak stopped. At Portsmouth she was examined, and drawings of the damage were made by an employé of the Great Western Company: she was repaired in a few hours, at an expense of about £30, and then started for China. An instance of the time a complete wreck takes to go down, so as to enable the crew to escape, was afforded by the *Brigand*, a large iron steamer, which had been trading between Liverpool and Bristol. She struck on sunken rocks off the Scilly Islands, filled a forward compartment, and had some part of her paddle-wheel forced so far into the engine-room as to damage the plates and fill that part also. She remained afloat, in consequence of the remaining compartments, long enough to enable the crew to save themselves and their kits comfortably, and then went down in deep water.

The Great Britain was begun in 1839, and was so far finished as to be launched on the 19th of July 1843. After this, an unforeseen circumstance occurred—she was imprisoned in the Bristol docks during several months; for, when her engines were shipped, she sunk so low as to bring her greatest breadth in contact with the too narrow sides of the lock. This caused great inconvenience to her owners, and some merriment to the public. The truth is, her dimensions were well adapted for a free passage through the locks when light, but it was deemed advisable to put the engines on board before she left the works, which rendered it imperative that a certain degree of temporary accommodation, in widening the top of the locks, should be afforded. The directors of the Dock Company having at length afforded all the requisite facilities, she was on the 12th December liberated and taken down the Avon and the Bristol Channel on her first trial trip. This proved satisfactory in every respect, and the Great Britain, in the beginning of the present year, steamed round to London, beating the fastest steamer that could be found to race with her. Since then, she has gone round to Liverpool, awaiting sailing orders for America.

We left her, much gratified by our visit; and having been put on shore, ended the day very agreeably with a dinner of white-bait, which is somehow generally associated with a visit to Blackwall.

CATTLE SHOWS.

We should imagine that the descendants of Jack Sprat, who, it may be remembered by the students of our early ballad literature, 'could eat no fat,' must have vanished from the land; or else that his progeny must have wonderfully increased, and that they all take after their mother, who, according to the bard, 'could eat no lean.' We have been led into this speculative reflection by a knowledge of the fact, that sixty thousand people went to Baker Street bazaar to see the cattle show—to feast their eyes on panting porkers, asthmatic sheep, and apoplectic oxen. We should doubt whether the meat is better because the animals are stuffed out to a size hitherto unparalleled, except on the external paintings of penny shows, where the living monsters are represented about twice the height and breadth of the caravan where the public are invited to visit them. The present, however, is the age of enlargement. Shopkeepers make arrangements for the enlargement of their premises; the legislature decrees the enlargement of prisoners for debt; newspaper proprietors enlarge their sheets; and, in order to keep pace with the enlarged views which are prevalent in the

* Vide *Athenæum*, No. 301.

present day, the agriculturists have commenced permanently enlarging their cattle. Perhaps the remains of gigantic animals that geologists have occasionally lighted on, may be traced to some antediluvian cattle show; and our ancestors may have rushed to an exhibition of prize mammoths with the same eagerness we of the present day evince in running after overgrown beeves, and alarmingly blown-out muttons. As we are informed that there is still 'room for improvement,' we must presume that more extensive bullocks, and more extravagantly exaggerated sheep, than any we have yet seen, are threatened by the Smithfield Cattle Club. To us there is something painfully pantomimic in the thought; and we look forward to the possibility of the extinction of mutton-chops, except as huge joints—a state of things that will be ruinous to the pure chop-house interest. Already does Brobdingnagian beef choke up the entrance to the butchers' shops; and extensive, indeed, must be the scale upon which the business of weighing it is conducted. It has occurred to us, that the same care and expense which are lavished on the fattening of animals, might be beneficially applied to the feeding of our own species, and we would suggest that the experiment should be tried, by offering premiums for prize paupers. It is, however, to be feared that the prize pauper-show would not turn out a very satisfactory affair; for, though unlimited oatmeal has a fattening effect on beasts, the same substance, diluted into gruel, and that very sparingly administered, would hardly produce, in human beings, a degree of obesity that would fit them to enter the pens of Baker Street in competition with the annual cattle show. Perhaps the system would answer better for schoolmasters, who might form themselves into a Fat-boy Club, and exhibit annual specimens of the pinguity attained by the scholars of their respective establishments. This would enable parents to select for their sons a school where the quality of the keep could be at once judged of by the plumpness of the boys exhibited. We merely throw out these hints as suggestions for improving the human race, by applying the principle of cattle shows, which are said to be extremely conducive to the amelioration of the breed of animals.—*Cruikshank's Tubbo-Book.*

DESTRUCTION OF WASPS.

We observe, from the Scottish newspapers, that the Earl of Traquair has for several years past given a liberal reward to the children in the neighbourhood for the destruction of those troublesome insects during the months of April and May. At that period every wasp is in search of a location for a nest, and if unmolested, would become the parent of thousands. Owing, it may be supposed, to the limited fall of rain or snow last winter, these noxious creatures have been unusually numerous this season, as the following account will show:—The children, about fifty in number, were desired by his lordship to attend at Traquair House with their spoil every Saturday afternoon, where they were counted by the gardener, and each one paid so much per dozen. On the 26th April there were delivered 756 dozen, on the 3d May 114 dozen, on the 10th May 594 dozen, and on the 17th May 643 dozen—making in all the incredible number of 18,876 wasps' nests in the course of four weeks, and in one parish. It may be presumed, if each of these had been allowed to multiply, however favourable the season may prove, there would have been little fruit or honey left for miles around.

IRISH ANTIQUITIES.

'As I was passing a place called Lavey Strand, on the road from Cavan to Dublin,' says a correspondent of the *Gardeners' Chronicle* for June, 'I observed the bottom of an ancient canoe lying on the shore of the lake close to the road. I immediately went to examine it, and heard that it had been raised about a year ago from the bottom of the lake. When discovered, there was a gunwale above a foot in height along the sides, which, when I saw it, was almost entirely broken away. It was of very rude manufacture, hollowed out of the stem of an oak tree. The dimensions are gigantic. The bottom is four feet three inches across at one end, and about three feet at the other; the length is forty feet. The diameter of the tree could not possibly have been less than seven feet and a half at the root, and at least five and a half at the height of forty feet. This would allow only a very moderate bulge for the canoe. What could have been the use of so large a canoe, made with great toil, on so small a piece of water (not containing 200 acres), I cannot conjecture. There are two islands in

the lake, which were found to be artificial when the proprietor was planting them about ten years ago. The earth is supported by a frame-work of enormous oak beams, mortised into each other, and this is supported on piles driven into the lake bottom. Some brass Celtic hatchets, ring money, and four brass swords, were found above the frame-work; and there is another canoe of smaller dimensions lying partly exposed and partly in the mud, near where the large one was found. The modern oak of this part of Ireland is not at all remarkable for its size.'

THE HAND.

[From 'Lays and Legends Illustrative of English Life,' by CAMILLA TOULMIN.]

WHAT is it, fashioned wondrously, that, twin-born with the brain,
Marks man from every meander thing that bounds across the plain,
Or gambols in the mighty deep, or floats in summer air?
What is the help meet for the mind, no lesser life may share?
It is the Hand, the Human Hand, interpreter of will—
Was ever servant yet so great, and so obedient still?
Of all Creation's mysteries with which the world is rife,
It seems a marvel to my soul but second unto life!
How weak a thing of flesh it is, yet think what it has done,
And ask from poor idolaters why it no worship won.
How could the lordly forest trees first bow their heads to man,
When with their ruined limbs he delved where veins of metal ran!
Ho! ho! 'tis found, and his to know the secrets of the forge,
And henceforth earth at his behest her riches must disgorge;
And now the Hand has servants fit, it guides as it is schooled,
To keep entire the perfect chain by which the world is ruled.
For when the molten iron flowed into the first rough mould,
The heritage of cunning craft was to the right hand sold;
And it hath been a careful lord, improving every right,
Until the mind is overawed by thinking of its might.
How slender and how fair a thing is woman's soft white hand,
Yet Saragozza's maid could seize the cannon's ready brand,
And martyred Joan (but not of war or carnage would I tell,
Unless the time were ripe, and mine the deep-toned honoured
shell,
Whose notes should be the requiem of the gory monarch dread—
Whose laurels still, though steeped in tears, conceal his leprous
head!)
The harp is roused by fingers fair, where clinging jewels glow
With light upon the aw'kening harp, like sunbeams upon snow;
Entranced music's soul returns once more to earth again,
A vassal to the hand that wills a gay or pensive strain.
Yet think that hand which never yet knew weariness or soft,
Whose fairness neither summer's sun nor winter's cold must spoil,
Which doth not know a harsher rule than leisure's chosen toil,
Is after all but fashioned like the trembling clammy thing
With which the faded sempstress pale, in youth's yet early spring,
Digs her own grave with needle small, through nature's drowsy
night—
Oh, when will fortune—justice too—unbind their eyes to light?
How is it fashion's proud array, thus wove on death's own loom,
Ne'er changes by a demon spell to trappings of the tomb?
The painter bodied forth ideas, which on the canvas live,
The sculptor bids the shapeless stone a form of beauty give;
Wise Egypt's giant Pyramids by human hands were piled,
To wrestle still with conquering time, though centuries have
smiled
With gentle touch to think how they sweep man from where he
stands,
Yet linger o'er the records of his wonder-working hands!
It is a thought to lift the soul beyond its prison home,
To ponder o'er such things as these beneath the fretted dome
Of Gothic fane where erst have swept the serge-clad monkish train,
Who sought to win their paradise by self-inflicted pain—
Who never knew the worship true that life's pure joys impart—
Yet what a world and history is every human heart!
Alas! material monuments too oft, like Babel's tower,
But tell of human littleness, and not of human power!
More subtle—less self-evident than marvels such as these—
Those spirit-deeds that leave behind but dream-like legacies—
Nothing that sense can see or touch, but much that thought can
keep,
As when the stately ship is taught its pathway o'er the deep
By one right hand that guides the helm, beneath the watchful
crowd
Of ever-silent stars that pierce through nature's nightly shroud.
But thought is lost in many dreams of all the wondrous band
Of things and deeds that owe their birth unto the Human Hand!

Published by W. and R. CHAMBERS, Edinburgh; and, with their permission, by W. S. ORR, Amen Corner, London.—Printed by BRADBURY AND EVANS, Whitefriars, London.

Complete sets of the Journal, *First Series*, in twelve volumes, and also odd numbers to complete sets, may be had from the publishers or their agents.—A stamped edition of the Journal is now issued, price 2½d., to go free by post.

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF 'CHAMBERS'S INFORMATION FOR THE PEOPLE,' 'CHAMBERS'S EDUCATIONAL COURSE,' &c.

No. 84. NEW SERIES.

SATURDAY, AUGUST 9, 1845.

PRICE 1½d.

JACOBINISM IN THE NURSERY.

It is fortunate for the adult, that children are dispersed in little parcels of four and a half individuals throughout private families; for, were it otherwise, they would certainly be found less manageable as a class than they are. Combined in masses—formed into unions—covenanted by charters—they might become seriously troublesome to papas and schoolmasters; and a servile might be found as nothing in comparison with an infantile war. I do not wish to see them become a rising generation in this sense; but I fully admit that we full-grown people give them all imaginable occasion for springing up in rebellion against us. The young are everywhere over the world an ill-used set of persons.

It is rather surprising, in an age when so many claims for class emancipation have been considered, that there should never have been the least attention bestowed upon the oppressed denizens of our firesides. Children are everywhere committed to an irresponsible power. Irresponsible power is acknowledged to be liable to great abuse. Yet we never think of children being in danger of suffering from this cause. There is here a selfish feeling which seems to preside in monarchists and republicans alike: all are decided for maintaining absolutism over the young. Let nations make themselves free from intruding conquerors, or sections of a people successfully assert their title to equal rights; but the young of every state, of every class, of every descent, must remain the thralls and serfs of their elders. There has never been any Tell, or Luther, or Wallace among the juveniles. And nobody dreams that there is the least occasion for such assertors of infantine liberty. Even philanthropists are silent upon this point. Nevertheless, I dare to believe that there is a vast tyranny in this department of our social economy, and that it calls for, and is capable of, remedy.

It is remarkable as, generally speaking, a well-meaning tyranny. Big man wishes well to little man. Big man is anxious to make little man as good—that is, as like himself as possible. Big man would take a great deal of trouble, and even endure a considerable sacrifice of his own feelings, for the sake of little man. Witness the sufferings which big man often undergoes in thrashing little man. Witness the distress of mind which it often costs big man to deny indulgences to little man. The misfortune is, that big man is only a kind of child himself—an unenlightened impulsive being, who either does not know what he ought to do, or, if otherwise, cannot do it; so that little man has no chance of being rightly dealt with by him. It is much worse when big man comes to have a notion of duty towards little man; for then he only pursues his wrong courses with more doggedness or fury. The lashes inflicted, and the restraints imposed by conscience, are the most cruel of

all. Heaven pity little man when he falls into the hands of a papa with a conscience!

I entirely deny every pretended right of the adult to exercise any control over the young, beyond what is rigidly definable as moral influence. No control of a different kind from this is needed in the case; and no such control can be used without injury to both parties. Such control is therefore to be condemned. We have here a question taking its place beside that respecting the abolition of capital punishments, and others in which the precepts of pure Christianity, harmonising with the dictates of the highest philosophy, are proposed to be for the first time followed. The stripes, snubbings, scoldings, privations, prisonings, disgracings, with which children are visited by their protectors, form, as it were, a dispensation of the inferior feelings, which must pass away, along with all other systems having the same bad foundation. Reason and affection are the true bases of the relation of parent and child, as they are the bases of all good social relations; and I venture to propound that there is no more necessity for ever departing, with respect to the young, from the rules of courtesy and good-breeding, than there is in our intercourse with equals in the common world.

Adults who for the first time undertake the charge of a child, usually commence with a bustling, anxious feeling of responsibility, and a sad want of faith in human nature. The sense of a tremendous coming struggle with something singularly perverse and difficult, is upon them, and they rush into a fight with one who is without the power either to aggress or to defend. There is something almost ludicrous in this disproportion between the subject of treatment and the treatment itself. It is like attacking a fly in a full suit of armour. The young human being is, in reality, a simple, innocent, tractable sort of creature. He is absolutely the same as his ruler, only without the wickedness and depraved reason which often belong to that person. Why all this terror about these poor harmless little men, as worthy Mr Burchell called them? The common feeling seems to be—he is a determined liar; let us flog it out of him: whereas it is only the natural and justifiable dread of these floggings which prompts the lie. He is sure to misjudge everything, and fall into irremediable error, if left to exercise his own reason: therefore let us force him to all the conclusions at which we have ourselves arrived: the consequence of which is, that his reason, not being exercised, becomes liable to errors which it would otherwise be in no danger of. He is wild and reckless, caring little for his parents and best benefactors: therefore let us assert due authority over, and exact due honour from him; the means taken for this purpose being exactly those which unavoidably alienate regard, and either excite rebellion or produce the worse evil of an utterly broken spirit. He has no liking for his tasks, or for

anything but play: therefore let us see to keep him at his books, and the more rigidly at those which he likes least; whence it results that the real aptitudes of the child for mental improvement are altogether misdirected, and he is inspired with disgust for what he might have otherwise embraced with eagerness. But, above all mistakes, is that of supposing that the better nature of a child is to be evoked and raised into the strength which we would desire to see it have in the full-grown man, by making him pass through a cold and cheerless youth. The very contrary is the case. A system of petty restraints and privations, of severe looks and incessant chidings, can only result in depraving the feelings and perverting the reason of a young person. He is, in such circumstances, entirely out of harmony with nature. He is like a flower which requires light and warmth, placed in a cold cellar, where it never can acquire its proper proportions, or colouring, or vigour. It is quite impossible that a child so treated can ever attain to the proper characteristics of a well-constituted and healthy man or woman.

Many big-man tyrants would, I verily believe, willingly adopt a different system, if they could be convinced that little man is capable of being brought to reasonable perfection otherwise. Now, I admit that the ordinary plan has usage on its side; but I would say that it is not by any means clear that the usage has been successful, seeing that many youths grow up very differently from what is expected; and that the children of the more awfully good are sometimes remarked to turn out the worst. To come more closely to the point, I would ask if there be anything in our common experiences of life to prove the efficiency of a system of terror and severity. Is it not rather found, when we use violence in act or in speech towards our fellow-creatures, or in any way treat them derogatorily, that we lose all right control over them? Do they not then usually take a stand upon their firmness and self-esteem, and set us at defiance? How, then, should it be supposed that discourtesy, harshness, painful restrictions upon personal freedom, taunts, scoldings, or any other contumelious treatment, is to succeed with children? Is it not evident, since they have the same nature as ourselves, that such treatment can only rouse their inferior feelings, as it does our own, and render them just so much the more unfit subjects of all right influence?

It is not upon the strength of theory alone that I venture to recommend the introduction into the nursery of the same principles which govern the drawing-room. My counsel is, that we should speak and act towards children upon the simple understanding that they are beings with feelings like ourselves, to be operated upon, as our own are, for good and for evil results. Seeing that we feel the force of kindness, of justice, and of reason, in our intercourse with society, I recommend that these principles alone should predominate in our relations with the young. I would never address to them a rude, harsh, or discourteous word; never exhibit before them any such passion as anger, or appeal to so mean a thing as punishment for effecting an end with them. Coming before them simply as friendly associates, possessing some advantage over them in point of experience and maturity of judgment, I would look for influence over them, as far as I desired any, simply to the love which a long course of endearing conduct must unavoidably engender in their breasts. There is, in reality, less need for what is called influence over children than is generally supposed. To give their faculties a chance of being rightly developed, they should be allowed to work out much for themselves. If the circumstances in which they are placed be pure, they will be pure also: there is no need, in such a case, for the perpetual ordering and directing which some parents deem necessary. If they be made, as they ought to be, confidential equals and friends, authority will be found an absurdity; for who seeks to have an authority over his friends? The true influence is that of love and respect, the same power which enables one man to

acquire standing amongst others in the common world. With this aid, there is nothing impossible in the management of children. It is the silken tie which binds more fast than chains of iron. Thus treated, I conceive that the infantine mind would expand much more vigorously than it usually does under the rule of fear. The product must be a man instead of a slave.

It will appear to many that the impulses of a large proportion of children are not to be guided or controlled in this manner. There is sometimes seen in children, particularly of the male sex, a recklessness and waywardness which it does not appear that anything but force could duly govern. I question if such impulses are, except in a few cases, of an evil nature. Mere burstings of the spirit of enterprise and activity they mostly are, which it is only necessary to direct to good ends, in order to turn them to good account. Often what we complain of in children is the natural fruit of that system of force and fear upon which we have proceeded in our intercourse with them. With really evil dispositions, it might possibly be shown that the one system is no more efficient than the other.
